The Week.

In no part of the mining world are prospects seemingly so dull as on the Comstock. To be sure, all interests have been suffering from the influence of the "hard times;" but, now that the crisis has been passed, and the industrial world generally has become convalescent, the Comstock still lags behind, with no immediate signs of recovery. This is particularly noticeable, in that the Comstocks have, through the Sutro compromise, an advantage of 1,600 feet in favor of their being worked successfully, as against the condition they were in a few months ago. It is hoped and expected that the economy theory now being put in practice will aid materially in awakening them from their lethargy. Something certainly must be done soon, or the public interest must pass from them to Bodie and other outside districts. In the Sutro tunnel everything is in a state of excited activity. There are now four hundred and fifty men at work, and more are being added daily. It now seems as if the necessary additions will be completed easily within the three months allowed by the contract, and that the pumping out of the flooded mines may begin at the end of that time.

Among home strikes, rich diggings are reported found in Placer county, in the Powell and Sophia gravel mines. The old Tybo Con. has struggled to its feet once more, again paid off its creditors, and again started up for itself—it is to be hoped on a better and more economical basis than heretofore.

Outside Prospecting on the Comstock Belt.

In all that pertains to the Comstock lode the Gold Hill *News* may, as a general thing, be accounted a good authority. As the friend of the laboring classes its advice is also apt to be sound and judicious. But when it counsels the working men on the Comstock who are out of employment to engage in the business of prospecting in that vicinity, we think there may be detected therein a slight departure from the usual practice of that paper. We do not believe that these men, however they may be out of employment, should be encouraged to further spend their time searching for ore deposits along that mineral-bearing belt. On the contrary, we are impressed with the opinion that this class has done too much of that sort of work there already. The development of the Comstock lode in both length and depth is altogether commendable. It is a mighty metalliferous channel and should be explored with system and thoroughness to the most profound depths attainable by human ingenuity and endurance. But no part of this work should be done or attempted by men of small means, much less by the mere day laborer, whose little earnings are his all.

The *News*, as if a little dubious about the soundness of this advice, remarks in an apologetic sort of way, that it would be better for these men to so employ their time than to remain idle altogether. As between these hard alternatives there is of course not much to choose, though we incline to the belief that the laboring man might as well lay off and take it easy as to waste his time and strength in the useless manner by the *News* suggested. A better way than either would be for him to leave the Comstock, where labor has always so accumulated in excess of demand, and repair to some other part of the country, where, if employment were no more plentiful, the inducements to prospect for mines would at least be better.

Within four or five miles of Gold Hill, and within the limits of what has generally been accounted the Comstock ore belt, there has in times past a good deal of this sort of poor man's prospecting been done. If we were to estimate the value of the time and means so spent at ten or twelve million dollars, it would hardly be excessive. For nearly twenty years now this business has been in progress; carried on at first by an army and afterwards by many hundred hopeful, resolute, hard-working men; for they were not idlers, inexperienced or empty handed, this army that California sent over to prospect the Comstock. They were veterans from her gold fields, trained to the business and hardened with toil. Inspired with expectation they labored diligently and well. Shafts were sunk, tunnels were driven and deep cuts opened along the outcropping veins till the mountains from Carson to Truckee were honeycombed with these excavations. Disappointed in their reasonable hopes the first crop of prospectors retired from the field only to be followed by others who in turn gave way, the crowd of hardy adventurers having come on in endless succession. And what has been their reward? What the recompense of all this expenditure and toil? Will the local press over there point to a single success achieved by these prospectors? Where is the mine they have opened? Where the ore body, the first element of a mine, that has been developed by these myriads of hard-working men? Or if they have ever found anything of value, what chance had they to retain it? If, at any time these prospectors have happened to strike something promising, has it not been claimed and eventually taken from them by the older and more powerful companies pretending to hold under earlier locations, or claiming it as a part of the main Comstock? For the poor man to prospect on that metalliferous belt or near it is but an idle waste of time, the chances of his striking anything worth striving for being altogether desperate, while if he happens to get a fair showing of ore, the deposit will most likely be wrested from him under one pretext or another.

Only along that section of the Comstock commencing at the Overman and extending thence north for a couple of miles, and covering a lateral space of a few hundred yards, has there ever been developed any mines of permanent value in that entire region of country, except it be in the vicinity of the Alta and Justice. Our Gold Hill contemporary refers to the success that has attended explorations in the Flowery district, and in the direction of American Flat as encouraging further prospecting in those outside localities. This, we take it, is intended as a bit of irony, seeing that none but the most disastrous results have attended prospecting in both these places. Does the *News* know of any mine in either of these localities or of any Washoe mine outside of the strip of country above mentioned, that is paying dividends, or has ever paid any, or even expenses? Does it know of any such mine that has ever yielded any considerable quantity of ore or any quantity at all for more than a short time, just long enough to have betrayed the ill-fated shareholders into the mistake of putting up hoisting and reduction works prematurely? We have no knowledge of any such property, and would be glad to be informed of the fact if any exists, has existed or is ever likely to exist.

Where they have mines on the Comstock they are mines indeed. The world has yet to elsewhere see their like. But so far as developments have gone, there are not many of them. Two miles in linear and half a mile in lateral extent covers the whole of them. But they have yielded some hundreds of millions of bullion, nevertheless. And their history is a grand one. Their record, with some little exception, is one that meets with general approval. The energy displayed in the management of these mines is something marvelous. And deeply as they have been explored, they still call for further downward development. There is every reason why new explorations should be undertaken along the line of the Comstock lode, both to the north and south of the present site of active operations. It might possibly be the part of wisdom to more thoroughly prospect some of the outlying lateral lodes. But this is all work to be done by men of large means and not any of it by those dependent on their daily earnings for subsistence.

Matters on the Comstock seem at last to be getting into better shape. In the settlement of the leading companies with the Sutro Tunnel corporation, in the tendency to restrict explorations to a few favorable points and push them there to determinate result, and in the efforts to simplify the administration of affairs generally, there is to be discerned the outlines of a wiser policy than has heretofore prevailed, and one that is to be hoped will meet with early adoption.

As regards the unemployed laborers on the Comstock, while it seems pretty clear that they should waste no more time prospecting in that vicinity, it is not so easy to point out exactly where they can go with a certainty of getting work or otherwise bettering their condition. Southwestern Nevada would seem to open just now a pretty good field for prospectors. The chances for getting work off that way are also tolerably good, many new mines being opened in Bodie and the adjacent districts. In the course of a couple of months there promises to be work for many men in the grain fields of California, though there will be here no dearth of hands, while the wages will be low, and it is a long time to wait. By the time, however, that the crops in this State are gathered, those in Nevada will be ready for the reapers, so that the harvester might, by making the round, extend the working season over several months. Touching the business of wood chopping, charcoal burning and other local industries, miners will be advised as to the openings and opportunities these may offer in their respective neighborhoods.

The Waterhouse & Brewer Engine.

We saw, this week, at Thomson & Evans' machine shop, 112 Beale street, a wonderfully simple little steam engine, which was built to send to Sacramento. The engine was invented by A. G. Waterhouse of Sacramento, the patent being owned by the inventor and Dr. B. B. Brewer of the same place. The engine has no screws, eccentrics, or parts to get out of order or that need adjusting, being composed of only a solid pitman and piston, and a small ring dropped into an open cylinder. The ring acts as a valve, being worked by the action of the piston. It is self-tightening, needing no adjustment, and controls the steam so as to make it perform its duty without leakage or loss of power. By putting two of these engines together, a large one and a small one, the small one exhausts into the large, thus using the steam over twice and making a compound engine of it.

If desired, either engine can be used separately, making different degrees of power. These engines require only a small part of the work to manufacture, that it takes to make an ordinary engine, nor does wear impair their working. They can run at very high speed and are cheap and economical. Any one interested in such articles will be interested in examining these engines, which are made in different sizes, from one to twenty-horse-power. We saw a practical engine there weighing only half a pound. A larger one weighed only 45 pounds without the fly-wheel, and it can be used single or compound. The simplicity of the engine is so great that it can be sold at a remarkably low price.

THE GOLDEN GATE SENTINEL is a handsome, eight-page paper, published in Oakland, semi-monthly, in the interest of the Ancient Order of United Workmen. It has lately been decidedly improved by its new proprietors, and deserves to be extensively patronized by the lodges and individual members of the "young giant" Order it sensibly and faithfully represents. We are acquainted with its conductors—Messrs. Glenn and Price—and look upon them as men worthy of success, and bound to achieve it with their commendable publication.

A HARBOR OF REFUGE.—Congress having made an appropriation for a harbor of refuge on the Oregon coast, various points are competing for the location, Cape Foulweather, the mouth of the Columbia, and Port Oxford being the most prominent.

Flooding the Colorado Desert.

General Fremont, now Governor of Arizona, is at present in Washington, whither he has gone for the purpose of urging upon the attention of Congress and the General Government, certain enterprises calculated to promote the welfare of that Territory and the regions adjacent, and also to enlist capital in the mining interests of the country. Among other projects of this kind, is one designed to flood the Colorado desert, and, in fact, convert it into a great inland sea, by opening a passage from the Gulf of California, and allowing the water to enter and overflow a large area in the southeastern corner of this State, and we presume also some portions of the northern part of Lower California, inasmuch as the head of the Gulf lies a long way south of the line, and wholly in Mexican territory. The area of country to be inundated is represented as being two hundred miles long and fifty miles wide, this new body of water to have an extreme depth of three hundred feet.

That this project is not only feasible, but easy of accomplishment, admits of no doubt, the district which it is intended to submerge lying below the level of the Gulf, from which it is separated by only some slightly elevated ridges, said to be depressed in places almost to sea level. The question is not so much one of financial and engineering difficulty, as of economical and sanitary considerations, fears having been expressed that the flooding of such a shallow basin, with its marshy borders, would breed enough malaria to endanger the health of the regions adjacent; the query also being suggested, whether it would be good policy to convert this district, desert as it is, into a vast expanse of salt water merely for the beneficial effects it would be likely to exert on the climate of the surrounding country and the facilities it would afford for inland navigation.

That the presence of so large a body of water would tend to moderate the temperature of this, the hottest and driest section of California, admits of no doubt. This lake would also open navigation to vessels of deeper draft than can now ascend the Colorado. But what business would there be for vessels on a lake like this, surrounded by sterile regions, destitute alike of agricultural and mineral resources? There are mineral-bearing lodes far to the north, on both the California and Arizona sides of the Colorado; but none, so far as we know, within a hundred miles or more of the site of this proposed inland sea. Unlike the Mohave desert, adjoining it on the north, this so-called Colorado desert produces much grass—so much in fact, that with water for stock, it would really be a valuable grazing district. As it lies so low, a great deal of it being depressed from fifty to three hundred feet below the sea level, it is probable that good water could be obtained by artesian boring—very likely, merely by digging. What little water there is near the surface is generally bad, being impregnated with alkaline, saline, or other substances of an injurious kind. At greater depths, it would no doubt be more plentiful, and of a better quality. The Railroad Company have, we believe, got good water at several points on this desert by boring, and that without going to very great depths.

With railroads traversing these deserts, such inland navigation as a lake of this kind would afford becomes of less importance; provided, always, there were any local carrying of consequence here to be done; which, as before remarked, there is not. The Southern Pacific road crosses this great arid basin diagonally and on its longest axis, affording every needed facility for supplying it with goods and shipping its scanty exports. Not much need for steamers circumnavigating the peninsula to perform this service.

It will be observed that this plan for introducing the salt water of the Gulf upon these dry lands and covering them up altogether, forms no part of the scheme of Dr. Wozencraft, who, on the contrary, proposes to irrigate them with water brought in from the Colorado river, and thereby convert them into a great tobacco, rice and cotton-producing region; an enterprise quite as feasible and seemingly more desirable in an economical point of view than this more recent and novel enterprise of the "Great Pathfinder."

PHILADELPHIA EXPOSITION.—The permanent exposition in Fairmount park, Philadelphia, is still maintained as a monument to the memory of the great Centennial. A friend in Philadelphia writes that it is proposed to enrich the display in a number of directions, and suggests that it would be opportune to send a standing exhibit of California's resources and productions. We publish the suggestion in case that it may reach one who is interested in showing up our state. As a rule, our State is rather off on the show business. It seems that the severe exertions to tackle immigrants, put forth four or five years ago had tired out the State, and it will need a good rest before it buys a new tent and hand-organ. This is not because there is any less to show than there was, but because all are somewhat disposed to let foreigners do their own view hunting. However, if anyone has the impulse to make a creditable display before Eastern eyes, by all means let them do it.

DOUBLE SHEET—24 PAGES.

Sonora, Mexico.

A Rich Country Whose Trade May Be Controlled by San Francisco. A Few Facts Concerning Sonora and the Proposed Sonora Railway.

The attention of San Francisco merchants and capitalists is being directed more strongly year by year to the importance of establishing commercial intercourse with the northern and western States of Mexico. The people of that section, particularly of Sonora, where they are removed from and have little sympathy with the revolutionary intrigues of the national capital, and do not partake so strongly of the national jealousy of the "Gringos," are becoming eager for the establishment of commercial relations with the United States, as they realize that American goods for which they have use are superior to those of English or German manufacture. Our calicoes and other cotton fabrics, our agricultural machinery, wagons, domestic and general hardware, cutlery, etc., are of a quality so much better adapted to their wants that the Mexican people will not buy the European articles offered them if they can get those of American production. This is a condition of affairs that only requires fostering to bear abundant fruits to American enterprise. Sonora, therefore, is ripe for an interchange of trade with California. The inauguration of rapid means of communication and ready facilities for transportation will effect this object certainly and surely. As a means to this end

The Sonora Railway

and telegraph line, projected from Guaymas to cross and terminate point on the southern border of Arizona, will be a most important factor. The accompanying outline map herewith presented shows the location of the principal rivers and towns of the section of country through which the surveyed lines of this railway pass. The Mexican government has manifested its desire to encourage an enterprise of this kind by granting to several individuals, resident in San Francisco and Mexico, a concession whose terms are exceedingly liberal, comprising exemption from import duties and State and general taxes for a term of years, free right of way, land grant of some 22,000 acres per mile, and other important privileges. The road will be commenced within a year, and will doubtless connect with the American system of railways at more than one point, as, in addition to the main line, as laid down in the map, a branch line is projected, starting a short distance south of the Arizona border and running eastward through Mexican territory, across the low Sierra Madre to the Rio Grande at or near El Paso, connecting with the Atchison, Topeka & Santa Fe railroad, the Denver & Rio Grande railway, the Texas & Pacific railway, or some other of the lines stretching out toward that focal point. The line at present under consideration, from Guaymas northward, passes through the heart of Sonora, a State whose mineral and agricultural resources, but partially developed, are superior to those of California, with a climate of great salubrity and an abundant rainfall to mature at least one crop a year, without irrigation. The distance from Guaymas to the border by the easternmost of the three surveyed routes is 265 miles, and the cost for a broad gauge road is estimated at but three and a half million dollars, or an average of but little more than $13,000 per mile. This low estimate is based on the exceedingly favorable topography of the country through which it passes, the cheapness of Mexican and Indian labor available (which is less than the Chinese labor of California), the low cost of importing material under the exemption of duties granted by the concession, and other favorable circumstances.

The Harbor of Guaymas.

The terminal point for the railway on the Gulf of California, 1,530 miles by water from San Francisco, is eminently the best on the western coast of Mexico, being much superior to either San Blas or Mazatlan, and because of the trade winds, particularly desirable as a port for the trades of the East Indies and China. The bay consists of an inner and outer one, in all four or five miles in length, almost completely sheltered from the winds by the bold hights of Pajaros on the east and the islands of Terra Firma, San Vicente and Petayas on the west, leaving the channel narrow and deep between them. The tides are irregular, being governed by the winds of the Gulf, seldom rising and falling more than four or five feet. The depth of water is from two fathoms at the moat, to eight fathoms in the channel. The harbor is capable of giving good anchorage to 200 vessels. The town of Guaymas contains some 7,000 inhabitants, and has an active trade, as it is the port of entry for nearly the whole State, while the large quantities of flour and other produce of the interior are here shipped to other ports along the coast. It is also shut in by high hills forming the fringe of the interior plateau that rises up from the coast with considerable abruptness. The railway can surmount this coast range with little difficulty and once upon the plateau the profile of the country for the greater portion of the remaining distance is that of an absolute plain, with scarce a variation, presenting a gradual rise of from 10 to 60 feet per mile to the summit of the dividing range near the Arizona border, where an elevation of about 4,300 feet is reached.

Hermosillo

Is 100 miles from Guaymas, on the line of the proposed railway, and the most considerable town encountered on the route. It is situated on the Sonora river, at a point where that stream cuts through a bed of beautiful white marble, pure enough for use in the arts, free from blemish, pure in color and susceptible of high polish. Yet, strange to say, the inhabitants of the city have been content to construct

MAP OF SONORA, MEXICO, AND SURROUNDING COUNTRY.

their dwellings of adobes, as their ancestors have done from time immemorial, making no use of the marble so accessible to their hands. Hermosillo has the reputation of being the most handsome city in Sonora. It is embowered in leafy gardens and luxuriant foliage, watered by canals from the river. It contains an estimated population of 12,000 inhabitants, with empty houses for as many more. Its depopulation has been caused by reduction of various industries to the north from Indian raids and by internal wars—the universal story in Mexico. It contains a mint, coining more than one million dollars annually. This, however, does not by any means represent the bullion product of Sonora, as a large amount is exported in the form of bars and crude ores, and a considerable quantity of bullion is smuggled to avoid coinage and export dues.

Agricultural Industry.

All up and down the Sonora and San Miguel valleys, where water can be obtained for irrigation, large crops of wheat, corn, tobacco, sugar and cotton are raised. The yield of the cereals is enormous. Wheat produces 40 to 60 bushels to one bushel sown. The rainy season sets in early in June and continues to October, though occasional showers fall until March. Most of the wheat raised is made into flour for export. Six flouring mills in the city of Hermosillo produce an average of 3,500 tons of flour of superior quality per annum. One is run by steam, one by horse-power, and the rest by water. There are 30 mills of like capacity in the immediate neighborhood of Hermosillo engaged in the manufacture of flour. The wheat is washed in vats and spread upon adobe floors to dry prior to being ground. The millstones in use have heretofore been French burrs, but a superior quality of millstone material has been discovered near Guaymas, which is coming into general favor. With the opening of the railway this quarry will doubtless yield millstones for export to California and other parts.

Agriculture has made wonderful strides in Sonora in the last few years, and on many of the large haciendas the equipment of farming machinery is scarcely inferior to that of the mammoth ranches of California. American headers, gang-plows, threshing machines and wagons have largely taken the place of the crude implements of former times. This has been brought about by the fact that the wealthier classes have in late years sent their sons abroad to be educated. The young men are now taking hold and introducing the progressive ideas which they have imbibed from association with more enlightened nations. The influence of the rising generation of educated men on the affairs of State give rise for strong hopefulness of the future prosperity of Sonora, and the adoption of a more liberal policy of commercial association with other nations. Indeed, they entertain the most exalted idea of the capacity of Americans and are in a condition to receive those who come among them with capital to develop their resources with unreserved welcome and encouragement. There is a clan in political circles that even favors annexation to the United States, although they would prefer secession from Mexico and absolute independence. The public sentiment of that section may be set down, however, as strongly opposed to any continuance of internal strife. As a

Grazing Country,

Sonora, particularly in the northern part, is destined to pre-eminence. The higher lands, unfit for agricultural use, are covered with a growth of nutritious grasses, adapted to sheep and cattle ranges. There are three varieties of grasses upon the lands; the mesquit grass, confined to the ranges of the mesquit timber; the *sacatom*, a coarse species found on the higher ranges, and the *grama*, occupying the plateaus and less elevated hills. The latter variety has much the appearance of dry, curled whittlings of pine wood, is very nutritious and is greedily eaten by animals. Throughout the entire year the cattle graze upon the hills, there being no need to preserve the grass.

Timber

Is more plentiful in northern Sonora than in the southern part of the State, and along many of the streams cottonwood, ash, black walnut and sycamore abound. On the bottom-lands are dense forests of mesquit, a species of acacia, yielding a fair quality of gum arabic, and growing sometimes to a diameter of three feet. It is unequaled for fuel, burning long and fiercely with an intense heat. It is particularly valuable for charcoal.

Anthracite Coal.

Sonora possesses a vast field of anthracite coal—the only anthracite yet discovered on the Pacific coast. It is said to belong to a very old geological formation, probably Silurian or Devonian. The only outcrop which is at present worked lies about 120 miles northeast of Guaymas, and a branch line of the Sonora railway is contemplated to develop it. The mine is a few miles north of the flourishing mining towns of La Barranca and Los Bronces, each supporting some 2,000 inhabitants. The coal has been used for two years for steam purposes at the Barranca quartz mill. The engineer in charge of the mill, who has had a long experience on Atlantic steamers, where he used Pennsylvania anthracite, believes it superior to the latter, the Sonora coal containing less ash and leaving no clinkers on the grate. It burns with the short, blue flame of carbonic oxide, which is characteristic of all anthracite coal. There are three veins of the coal, one of which is seven feet thick, another two and one-half feet and the third of unknown thickness, while there are indications of a seam lying beneath the 7-foot vein—the one now worked—of the same or greater thickness. Outcroppings of the veins are traced for many miles. The analysis of this coal as compared with the average grade of Pennsylvania anthracite is as follows:

	Sonora Coal.	Pennsylvania Coal.
Fixed Carbon	94@96%	85% (about
Ash	3@4 %	10%
Moisture	1@2 %	4@5%
Sulphur	0.0 %	a trace
Bitumen	0.0 %	a trace
Specific gravity	1.77	1.50

The dip of the discovery is 26° toward the opening, rendering the mine easy of drainage and cheaply worked. The length of the branch from the main line at Noria del Valle (32 miles from Guaymas) necessary to reach the mine, is 98 miles. It is estimated that after the construction of the road the coal may be marketed in San Francisco and South American ports at $8 to $9 per ton. San Francisco consumes 600,000 tons of all coals annually, and Mexican and Central and South American ports consume 650,000 tons, for steamship purposes alone. About 700,000 tons of this is of foreign importation; its value is $6.50 to $10 per ton. The value of anthracite coal is from $12 to $15 per ton. San Francisco consumes about 22,000 tons of anthracite coal annually at present prices. The opening of this mine and its introduction to this market at the prices estimated would be of vast importance to the manufacturing industries of this city and the interior. Specimens of the coal have been brought to San Francisco and exhibited, exciting the admiration of all who have seen it.

The Mines.

Great as is the wealth of Sonora in agricultural and pastoral resources, her chief glory lies in her mines. The low mountain ranges abound in minerals, but the mines which are profitably

worked are but few in number compared with those whose wealth has besn explored and definitely known, but whose development has been prevented or retarded by the incursions of the murderous Apaches that have, until a few ysars past, infested and laid waste ths outlying districts.

A Romantic History.

It is not the purpose of this general articls on the resources of this little known country to describs tbe mines of Sonora, but there attaches to ons section of the State near the American border, a history so romantic that a condensed account of it must prove generally interesting, particularly as it is the only portion of Mexico where placers of silver were ever known to exist. The "Planchas ds Plata" (literally, slabs of silver—enticing name!) is the nams givsn to a locality in ths Arizona mountains, a dozen milss south of ths border, 75 miles due south of Tucson and 45 miles due north of Magdalena, where, 121 years ago, according to the archives of Spain and Mexico, Spanish explorers discovered largs masses of pure silver on the surface of the ground, and at a depth of a few feet, in the form of slahs, balls and grains, some of them very large—one weighing as much as 140 arrobas (3,500 pounds), which had to be melted down to be weighed and transported. All these discoveries were claimed hy the Crown, and no encouragement being given to miners to remain in the presence of hostile Indians, the mines were speedily abandoned and the records locked up hy the Jesuit Fathers, so that they could not readily be traced.

Later, in 1817, Don Dionisio Robles, a citizen of Rayon, witb a large force, 200 mcn, penetrated the district, found what they helieved to be the old placers and obtained a considerable quantity of silver in pure masses. The Don was in turn compelled hy tbe Indians to abandon his discoveriee after a stay of only eight days. About the year 1850, in an expedition made hy parties from Hermosillo, a large lump of native eilver was found, which was carried to the City of Mexico and caused considerable excitement there. About this time also, the great banking house of Jecker Torre & Co., of the City of Mexico, obtained from the Mexican government a grant of all the mines in the Sierra de Arizona and lands for tbe purpose of colonization. By their orders, and at their expense, an expedition was organized in San Francisco in 1852, nnder the command of the unfortunate Count Gaston Raousset de Bourbon, of 400 thoroughly disciplined men—old French eoldiers. They landed at Guaymas, and, after considerable delay there, marched to Saric, a village on the north branch of the Magdalena river, near the Planchas. Here they remained six weeks, but without any other attempt to enter the district than by a small party of cavalry under command of Captain Le Noir, which was absent three days. Owing to the intrigues of the rival house of Barron, Forbes & Co., in Mexico, and the jealousy of the new Governor, every obstacle was put in the way of Raousset to the accomplishment of the ohject of his expedition —the rediscovery of the old placers. Theee intrigues finally ended in an open rupture, upon which Raousset marched to Hermosillo, where he met the government troops and defeated them in a severe engagement. He was subsequently taken sick (some say poisoned) and carried in a litter to Guaymas, where his officers, nnder an arrangement with the authorities, reembarked their men for San Francisco.

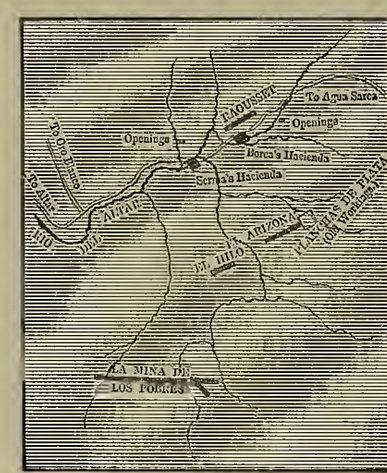
In 1854, Raousset organized another expedition in San Francisco, similar to the first, and landed in Guaymas. Again enconntering the opposition of the authorities, an engagement ensued in which he was defeated and taken prieoner, tried by conrt martial and shot.

In 1870-71, Gen. Serna, then (Vice-Governor of Sonora, obtaiuing some particular information regarding this district, organized another expedition to discover it. The hostile Apaches, through the efforts of Gen. Crook in Arizona and the Mexican authorities in Sonora, had now heen subdued and removed to distant reservations. Gen. Serna had no difficulty in finding the spot from which these large masses of silver had heen taken, and himself found a lump weighing 45 pounds. No less than 40 tons of pnre silver are said to have been taken out of this spot. Under his protection quite a number of prospectors and miners went to work on the old, and to search for new placers. The dietrict prospected by them seems qnite emall—not over two or three miles square. No other placer was fonnd, but in the veins which were discovered and opened considerable quantities of pure chlorides of silver were found. A few feet below the surface this became more diffused, the veins widened, and though apparently filled with good ores, no native silver nor rich chlorides were found in sufficient quantities to repay the search. As these men were unprepared to work ores of any sort, the object of the expedition being alone for native or placer silver, after a few months the place was again abandoned, one man only being lcft, who kept up the search a few months longer, meantime sinking a shaft on a vein which he called the "Mejia," to a depth of 45 varas (125 feet), and reducing the ores obtained in a rude way in arastras to obtain money to carry on the search, hut finding no masses of pure silver as expected, and encountering more water than his rude appliances could handle, he, too, gave up.

That the silver in its pure state and in enormous masses, was actually fonud is a matter too fully established by history and official records to admit of a doubt. The space over which they were discovered did not exceed 300 feet square, in such a position on a hillside that it is quite evident the slabs must have fallen or been washed from the outcrop of a wide ledge that cuts the summit of the hill above, designated on the accompanying diagram of the district as "El Arizona." Soms residents of San Francisco, associated with citizens of Mexico, have recently come in possession of the two mines, "El Arizona" and "Raousset," and a company has been organized to work them.

Description of the Mines.

The rock of the country is granite and porphyry. This is generally overlaid with a porphyritic conglomsrate to varying depths in the summits of the ridges. The general direction of all the veins or ledges disclosed is nearly magnetic northeast and southwest. The ore of ths Raousset seems to be all porphyritic, containing principally bromides and chlorides of silver, without gold or base metals. The ore is found in the conglomerate and appears to be in a series of parallel veins, each from two to five feet in width, lying close together and covering the whole surface of the hill. The opsnings are mostly open cuts; seven of them cover a length on the veins of 250 feet and a width of 75 feet, thsir greatest depth being only 20 feet. "El Hilo" is half a mile south and at an elevation of 4,100 feet above tide. The ore is very rich in chlorides, and from a cut 30 feet long, two feet wide, and four or five feet deep, Gen. Serna, iu 1872, is said to have taken $12,000 from the chloride ores and 50 pounds of silver from a single lot of 400 pounds of rock. The mine is now being worked by Mexicans. About a mile south and west of "El Hilo" is the shaft of the "Mina de los Pobres," which a few months ago was reopened from the old workings, and is being developed by a party of Americans, who have sunk a ehaft to a depth of 25 or 30 feet, where it shows a well-defiued vein, enclosed in granite and porphyry walls, having a seam of two inches of talc in the hanging wall. The vein is exposed by prospect holes for a distance of half a mile. The shaft is near the summit of a high ridge, 4,400 feet ahove tide and 200 feet above the gulch. A tunnel is being driven into the hillside 145 feet to intersect the vein 55 feet below the bottom of the shaft, and at a point 30 or 40 feet distant from it. The work progresses slowly on account of lack of funds. Some samples of very rich ore have been taken out mostly free-milling chlorides. Analyses of five samples of the Raousset ore, picked up at random from waste ore at the dumps, are as follows: $93.35, $58.96, $91.97, $186.20, $51.72 per ton. From a prospect hole in El Arizona, near the placers, a piece of rock assayed $82.49. A specimen from El Hilo shaft assayed $279.03, and one from Mina de los Pobres yielded $119.85.



PLANCHAS DE PLATA.

The district lies upon a series of high ridges separated by small gulches which converge toward the spot occupied by the hamlet, lying between Serna's and Borquez' haciendas. The summits of the ridges are from 300 to 600 feet above the level of the village. The sides are generally smooth and unbroken, and covered with a rich growth of grama grass, affording excellent nastures, and dotted with trees, black oak, of good size. Near hy, the higher mountain slopes are covered with heavy forests, principally oak, with some pines. All the gulches contain small streams of running water, aud are considered nufailing.

Such is the description of the famous Planchas de Plata, a district famous in the past, and destiued to he more famous in the future, though let ue hope it may not cost the hlood and treasure to garner its wealth that has been expended in searching for it in the years since its first discovery. The tribulations and trials of these early expeditions are interesting, and, hut for lack of space, it would afford us pleasure to preseut translations of the quaint old chronicles descriptive of them. "Los Apostolicos ofaues de la Compania de Jesus" describes them in detail, and "Noticias Estadisticas del Estado de Sonora" refers to them at leugth. The Sonora railway will greatly aid in the development of the "Planchas de Plata," as it will the whole of southern Arizona, for which it will afford the shortest and most direct route to the sea. But whether that he huilt or not, the district will be made to yield its treasures, and the secrets of the earth be unfolded by the invincible spirit and enterprise of the miner.

A Rival for San Francisco.

In ths foregoing we have shown something of the possible sources of a lucrative local traffic for the contemplated railway, but have scarcely hinted at the through traffic it may have when joined with an Eastern trans-continental railway, shortening the distance across the continsnt more than a thousand miles, and building up a sea port on the Gulf, that will bid strongly with San Francisco for the trade of the Indies.

The Power of Niagara

Dr. Siemens, soms months ago, in an address which he then gave, referred to the immense quantity of power which flows ready made over the Falls of Niagara. In his Glasgow address he again referred to the subject, in order to show how this gigantic source of power might be utilized to produce action at a distance. "Wheu," he says, "little more than a twelvemonth ago I visited ths Falls of Niagara, I was particularly struck with the extraordinary amount of force which is lost as far as the useful purposes of man are concerned. 100,000,000 tons of water fall there every hour from a vertical hight of 150 feet, which represents an aggregate of 16,800,000 horse-power, producing, as the effect, no other results than to raise the temperature of the water at the foot of the fall

$$\frac{250}{772}\ \frac{1^\circ}{5^\circ}\ \text{-Fahr.}$$

In order to produce the power of 16,800,000 horses; or, in other words, to pump back the water from below to above the fall, would require an annual expenditure of not less than 266,000,000 tons of coal, calculated at an average consumption of four pounds of coal per horse-power per hour, which amount is equivalent to the total coal consumption of the world.

In stating these facts in my inaugural address, on assuming the Presidency of the Iron and Steel Institute, I ventured to express the opinion that, in order to utilize natural forces of this description at distant town and centers of industry, the electric conductor might be resorted to. This view was at that time unsupported by experimental data such as I have been able since then to collect."

Dr. Siemens then shows what had been done in conveying the electric light to a distance; and he states that "if mechanical force is required to be distributed, the arrangements are in every respect similar to those for the distribution of electric light; and it has been proved experimentally that the amount of power recovered at the distant etation is nearly equal to half the power employed at the central etation." Even as regards the consumption of coal, were that article used, Dr. Siemens shows that the magneto-electric machine is cheaper than the gas or steam engine.

During the month of February the gold mines incorporated in San Francisco produced bullion to the value of $265,300. The silver mines of Utah, Nevada and Arizona, to the number of 17, produced $535,000. The gold and silver mines, California, Con. Virginia and Ophir, produced $284,600 in gold and $342,400 in silver; total, $627,000. The hase metal mines, during February, produced $108,000 gold, $203,000 silver and $83,100 lead. The total hullion product of 32 mines for February was $1,811,000. The product of 28 mines in February, 1878, was $4,580,900. The 90% decrease is due to the lessened product of the California and Con. Virginia.—*Salt Lake Tribune.*

To Waterproof Canvas.—The *Engineer* gives the following: Add 1½ pints of water to 6 ounces of hard, yellow soap, and when boiling add 5 pounds of ground spruce ochre, ½ pound patent driers, and 5 pounds of boiled linseed oil.

Mining Notes from Siskiyou.

Editors Press:—On the 15th inst. I had the pleasure of visiting the quartz mine of H. C. Cory & Sons. I found two of them at the mine, and I also found a good prospect in the mins. At the surface the ledge is about eight inches. It is down about 30 feet, and in about 42 feet. It is over three feet, honest measurement with taps, for I held both ends of the tape, and know whereof I speak. They have about 15 tons of rock out, and all through this rock I saw gold, not in every piece, but quite often. The rock is well sprinkled, to say the least. At first the rock was soft and easily worked, but now it is hard and requires blasting. Mr. Cory informed me that he will commence crushing in May, and will use the Hartstrand mill. Hs will make some repairs on it, however, before making the run. He has written below regarding the best methods and machinery for saving fine gold. I expect to have favorable reports to make to you regarding this mine in ths future. Tbe other minss adjoining his are watching and waiting the results of this run with considerable anxiety. Even the rock in which we can see no gold, prospects well, and there is no doubt but that the mine is rich and valuable, if it only holds out; present iudications are that it will continue to improve. We hope so, at least, for if anyone deserves euccess it is Cory. Of the French Creek mines, mors anon.

I hear that the South Fork and neighboring placer mines are doing well; also the Quartz Valley quartz mines. Roberts cleaned up a six weeks' run (piping) on Walsh's placer mine, on French creek, witb fair success, and intends making another run. Nelson is opening a new mine on French creek. The weather is stormy, roads bad, and farmers putting in their crops.

R. D. Nunnally.

Etna, Mar. 23d.

Behr's Indicators.

The trouble in indicatore has been to get travel enough for the pointer, so as to enahle the engineer to land his cage at different poiuts in tbe shaft by the indicator, and to avoid the use of tags on the rope, which are expensive and unreliable. The indicator invented by Hans Behr is intended to overcome these difficulties.

It consists simply of two revolving drums, eix feet long and four feet in diameter—one for each reel—placed iu such a position as to be in full view of the engineer and hrakemen, to which is attached a spiral, placed on a pitch of four inches. These drums revolve with and are driven by the reels, and are so geared that the drums make 25 revolutions for 3,000 feet of rope. The pointers are attached to and driven by side screws in such a manner that, as the drums revolve, the pointers move up and down and always point to some portion of the spiral on the drums. Stationary points are attached to the spiral at such places as will correspond to the stations in the shaft.

The effect is that each foot in the shaft is represented hy one inch on the indicator, which gives sufficient movement to enable the engineer to land his cages accurately, even to tbe inch where wanted.

In designiug that king of hoisting engines just placed at the North Con. shaft, Mr. Patton thought these indicators of such importance that he adopted them and they are in place on the engine. They have been adopted also for the engines at the C. & C. shaft, where they are soon to be placed. This is sufficient to insure their general use on the Comstock ere long. —*Gold Hill News.*

The Ship of the Desert Outdone.

A report, says the Visalia *Delta*, comes from the Sierra Nevada mountains of the discovery of the timbers of a stranded vessel, resembling those of a Chinese junk, high up in the mountains, between Mineral King aud the headwaters of Kings river. The souud portions of the timher resemble camphor wood, and it is said, still retain a faint smell. The fastenings are of copper; tbe rigging, etc., are, of course, all gone. A number of bones, supposed to he human, were also fonnd in the vicinity, and upou tbe adjacent slones there is ahundant evidence of the previoue occupation of the waters, in the shape of shells, as well as the occasional finding of petrified fish. That this valley has at one time beeu an inland sea is admitted by geologists, hut that these waters were navigated by Celestial seamen one or two thousaud years ago has never been claimed, even hy the Chinese themselves. But these same people do claim to have been the original discoverers of this country, and this find seems to give color to the claim. It has also been claimed by them that vessels of theirs have been wrecked on this coast, and that portions of the crew have returned to China; but that the wreck itself should be located, and that this location should prove to be in Tulare county, is surely an interesting fact, inviting the inspection of the curious and the solution of the scientific.

How to Make an Emery Wheel.—Take a smoothly-turned wooden wheel, and cover the same with leather, devoid of grease, and coat the leather surface, a portion at a time, with good glue; immediately roll the glued surface in emery spread out on a board.

The Flounders of our Markets.—No. 1.

[Read by W. N Lockington before the San Francisco Academy of Sciences, March 17th, 1879.]

No tribe of fishes is probably so well known to that large class of naturalists whose love of nature takes a practical turn, who like best those creatures which taste best when boiled or fried, as the flounders, flatfishes, or pleuronec. tidæ. Apart from their attractiveness to the sense of taste, they have one peculiarity which challenges the attention of the most uninterested observer of the world's living wonders—they have both their eyes placed on the same side of the head. If a little more attention be paid to this obvious feature, it will be found to be even a greater peculiarity than was at first supposed. The flounders are not the only fishes which have their eyes on the same side of the body; the skates, rays, torpedoes, and their relations are in this respect very similar. Where, then, lies the great difference between these two classes, for no one would confound the two, even at the first glance?

Simply in this, that the skate and ray tribe are flattened downwards, the side which is uppermost is the proper upper side, and the eyes are placed in their usual position with regard to the other parts of the head; whereas in the flat-fishes the body is flattened out sideways, the fish swims on one of its sides instead of on the proper under surface; and the eye, which of right belongs to the side which is beneath, has twisted round out of its place, and is situated on the same side with the other, unsymmetrically with the other parts of the head. Of course this is not the only difference between the skates and the flounders; there are far more important anatomical differences, but it is one of the most obvious outward distinctions between two tribes which, though widely separated in other respects, resemble each other in having the eyes so placed as to look upwards, in their thin flat bodies, colored upon the upper side only or principally, and in their habit of residing at the bottom of the sea, their uncolored surface resting on the bottom. Again, the flat-fishes are not the only fishes which have a very wide body, flattened laterally; the sunfish is also very deep from dorsal to anal, and some of the mackerel tribe are even more excessively compressed; but these and all other laterally compressed fishes, except the flat-fishes, swim in the usual manner, dorsal fin uppermost, and the eyes are in the usual position, one on each side. It will be readily understood that the two eyes cannot be brought round to one cheek without great distortion of the bones of the skull; many of the bones on the colored side are cramped in their development, squeezed into a narrow space, out of the way of the encroaching eye; while some of the bones of the blind side are correspondingly enlarged, filling up, by their lateral extension, the place where, so to speak, the eye ought to be. Now, a distortion of this importance, if it occurred in any other kind of animal, and were not of universal occurrence in the whole tribe, would be considered a monstrosity; and it became an interesting question to ascertain at what point in the life-history of these fishes the distortion commenced. Surely so very important and radical a modification of the skull and bones of the head must commence at the very first commencement of the formation of the fish before it is hatched from the ovium? But it has lately been conclusively proved that this is not the case. Prof. Alex. Agassiz has watched the development of young flounders, and has proved that when first hatched, they resemble other fishes in the position of the eyes and the symmetrical form of the head; and that the distortion is the result of habit, which habit again increases the distortion, precisely as claimed by the advocates of what is usually called "evolution." That is to say, the young fishes seek the bottom of the water, yet strive to use the lower eye. By the continued effort to use this, the soft structure of the head is affected, and an oblique upward view is gained. This renders the fish less fitted than before for locomotion in the usual manner, and more adapted for keeping at the bottom, which it accordingly does, with the result that the eye becomes more and more twisted, till at last it has passed clear over the dorsal ridge of the animal, and makes its appearance on the same side with the other eye. This side is in some species the right, while in others it is the left side. All this takes place while the creature is young, and before the bones are hardened.

But it must be remembered that the bones of fishes are, as a whole, much softer than those of reptiles, birds, or mammals, and therefore much more capable of yielding to impressions from the outside without the destruction of the life of the organism. From a cavity among the roots of a tree, in a pond, a tench has been taken, which was fitted exactly to the shape of its residence. It had gone in when young and small, and stayed till it was too large to go out. The Chinese, by feeding goldfishes in small jars, produce most singular distortions of mouth, eyes, and form of body. When a young fish, whose habit is to feed by pursuing and catching its prey in a horizontal direction, is confined in a small space and systematically fed from above, the direction of the gape of the mouth becomes changed by the constant effort to reach its food. But this is not the place to bring together some of those endless facts of nature, which, drawn from plant and animal alike, from the humble mold, from the coral, the shell-fish, the insect, the fish, the bird, the mammal, aye, and from the history of our own race, and the individual history of our own lives, go to prove that all the varied forms of plants and animals, with all their varied qualities, tendencies and dispositions, are but the result of the interaction between the properties of the materials of which we are composed and the forces which act upon them from the outside; or, in other words, of a constant struggle between the organism and its environment, in which the former either adapts itself to the latter, and thus changes when the latter changes, or else perishes through its want of plasticity.

To return to our flounders. Seventeen or eighteen kinds are now known from the coast of California and northwards, and of these I have found twelve in the markets of this city. Of these twelve, three have their eyes and color upon the left side, but all the others are dextral, that is, have their eyes on the right side, and the color, as is always the case, on the same side with the eyes. Three of these kinds are not sufficiently common to be of much importance as articles of food, but all the others are more or less abundant. Of their comparative delicacy or flavor I am not prepared to speak; in fact, this is just the point upon which I seek information; but it may be as well to remark that no real "sole" is found here, although certain species are sold under that name. Neither can I say much respecting the distribution of any of the species northwards and southwards from this point, some, as I know, from those who have previously written on the subject, occur in Humboldt bay, Vanconver's island, Alaska, and even Kamtschatka, but of others all I know, in some cases all that is known (for two of the species I enumerate have not been noticed before), is that they are found within the range of the fishing vessels which go out from this bay, a range probably limited to Tomales and Bodega bays to the north; the Farallone islands on the west, and the bay of Monterey on the south. Most of those which come from deep water are from near the Farallones. Neither can I tell what is the favorite food of each species. A much more extended series of observations, carried on by the examination of the stomachs of fresh specimens, and by keeping them alive in aquaria, will be necessary before this can be ascertained. In the stomachs of two individuals belonging to two nearly related species, I found the half-digested remains of three anchovies (*Engraulis ringens*), and in one of them a small species of shrimp-like crustacean (*Hippolyte* genus).

The principal enemies of the flat-fishes are, I believe, the ray tribe. As the former are specialized to reside at the bottom of the water, there seeking their food, and, by covering themselves with stones or mud, avoiding the attacks of many predatory fishes; so the rays, on their part, have become specialized to reside principally at the bottom, and to keep down the increase of the flounders. And what chance can a flat-fish, large and strong though it may be, have to escape from the pursuing skate or sting-ray? The former, with but a small pectoral fin on its colored side, while that of the blind side has become partially atrophied by disuse, and with ventrals of minute proportions, can at best but flounder along the bottom, or, with a sudden effort, for a moment attain the perpendicular position natural to most fishes, and then again sink down in the mud; while the latter, equipped with a huge pair of pectoral fins, exceeding the body in size, and able to move along the bottom or rise at pleasure to any desirable hight, flaps along like a huge butterfly; a butterfly, however, that hides beneath its expanse of wing a deadly array of teeth.

Not long ago, in some popular account of fishes and their habits, I read that fishes were usually quiet and gentle, that their very appearance indicated gentleness. Nothing can be farther from the truth. Few fishes are herbivorous; by far the larger part live upon other fishes, the spawn of fishes, or the more lowly inhabitants of the waters, many of them not sparing the eggs or the young of their own species.

Hippoglossoides melanostictus; Psettichthys melanostictus, Girard.—As most of the fishermen and fishmongers of San Francisco and its neighborhood are Europeans, principally Italians and Mediterranean peoples, with a sprinkling of English and New Englanders, they have given to such fishes as they have thought worthy of a vernacular title, names which properly belong to species found in the Mediterranean and Atlantic, and frequently but distantly related to their Pacific namesakes. In pursuance of this rule, the name "sole" is applied to at least four species brought to the markets of San Francisco, two of them (*Psettichthys melanostictus* and *Hippoglossoides Jordani*) sufficiently common, while the third (*Lepidopsetta bilineata*) is somewhat rare. The first of these is the most common and the best known. It does not appear, so far as I have been able to ascertain, to be caught within the Bay of San Francisco, but is taken outside the Heads and at the Farallone islands. The greater number of the examples I have seen are about 10 inches in length, but some attain a length of 18 inches or even more. This species may be readily distinguished from all the other flat-fishes found in our markets by the greater breadth of the space between the eye, which, in adults of 11½ inches in length, exceeds the half of the transverse diameter of the eye; by the form of the dorsal fin, the first rays of which, situated on the top of the head, are higher than those immediately succeeding them; and by the dark gray color, produced by black spots, just large enough to be recognized as such by the naked eye, upon a ground of a lighter tint. These black spots are not conspicuous in individuals just taken from the water, which are of a more uniform and far lighter color, but become so after a few hours exposure to the air. The interorbital space varies in width, apparently increasing with age, since in a specimen 7½ inches long it measured only one-third of the transverse diameter of the eye, and in smaller individuals is of still narrower proportions.

The number of rays in the dorsal and anal fins is also, as is not unusual among long-finned fishes, subject to considerable variation. Girard gives the formula of these fins as, "D. 78, A. 60;" while in an individual 10¼ inches long I counted 88 dorsal and 60 anal rays, and another 6½ inches long, had 81 dorsal and 61 or 62 anal rays.

The proportions of the body are also somewhat variable. A specimen 10¼ inches in total length, measured four inches in breadth, but most are of most slender proportions.

In the stomach of a specimen 7½ inches long, were the half-digested remains of two anchovies (*Engraulis ringens*).

For this species and another (*Citharichthys sordidus*) which is really widely different, as the eyes and color are on the left side, and the ventral fin of the colored side is placed upon the ridge of the abdomen. Girard instituted the genus *Psettichthys*, but after the separation of *Citharichthys sordidus* from it, the only characters left to distinguish *Psettichthys* from the older genus *Hippoglossoides*, were smooth scales, and the more anterior commencement of the dorsal fin. An examination of specimens larger than that from which Girard describes his species (4⅝ inches long) proves that the scales are not smooth, but ciliated, or set on the hinder edge with flexible spinules; so that this character disappears, and as the very slight difference in the point of origin of the dorsal is certainly quite insufficient to be reckoned of generic value, I have relegated it to *Hippoglossoides*, a second species of which genus is also found in our waters.

Hippoglossoides Jordani, nov. sp.—This species is tolerably common in the markets of San Francisco, but appears to have hitherto escaped description, probably on account of its considerable external resemblance to *Psettichthys melanostictus*, Girard; from which, however, it may be readily distinguished by the form of the dorsal fin, which increases toward the center, instead of commencing with rays higher than those immediately succeeding them (as is the case in the latter species) by the narrower interorbital space; and, still more readily, by the color, which is more uniform and lighter, the black points upon the scales, which are conspicuous to the naked eye in *P. melanostictus*, not being evident unless viewed with a lens. In large specimens the head has a reddish tinge. The largest I have yet seen measured 16 inches in length. In common with *P. melanostictus*, this species bears in the markets the name of "sole," and the fishmongers, who readily distinguish from each other most of the species of flat-fishes, do not appear to be able to discriminate between these. So far as I have been able to learn, it is taken outside of the bay, in the same localities with *P. melanostictus*.

In form of body, size, structure of the mouth, scales and lateral line, this species resembles the species previously mentioned; the distinctions between them are certainly only of specific value, yet they are perfectly constant, and a glance at the origin of the dorsal fin is alone sufficient to determine to which species an individual belongs. I have written a technical description of this fish for publication in the Proc. Phil. Acad. Nat. Sciences, and have taken the liberty to name it after the distinguished ichthyologist, Prof. D. S. Jordan, who has done more than any other American to increase our knowledge of the fresh-water fishes of the United States, and who is at present engaged in preparing an ichthyology of the United States, which will include the fishes of the Pacific coast.

Uropsetta Californica, Jordan; *Hippoglossus Californicus*, Ayres.—This species is not taken in the Bay of San Francisco, and is not by any means so common in the markets as *Psettichthys melanostictus*, *Citharichthys sordidus* or *Platichthys stellatus*. It may be readily distinguished from all our other Pleuronectids by the bold, abrupt arch made by the lateral line above the pectoral fin; by the presence of the eyes and color upon the left side; by its elongated, regularly ovate form; and by the shortness of the head. It is said to become more abundant to the south of San Francisco. This species was first described by Dr. Ayres under the name of *Hippoglossus Californicus*, or the Californian halibut, that industrious ichthyologist being of the opinion that it was congeneric with the true halibut (*Hippoglossus vulgaris*). Its affinities to that well-known species are recognized by the fishermen, who call it the Bastard or Monterey Halibut; but state that, compared with the true halibut, it is a tough, coarse fish. It is the largest of the flat-fishes of our waters, attaining a weight of from 50 to 60 pounds; the two largest I have yet seen weighed respectively 43 and 58 pounds, the latter measuring 4 feet 10 inches in total length.

A true halibut, probably identical with the European species, and far preferable to the present species as an article of food, occurs to the north of this State, and is quite abundant in Vancouver's island; it frequently attains a weight of 90 to a 100 pounds, and occasionally reaches 200 pounds. I have not as yet seen the true halibut in our market, although it is possible it may occasionally be brought there.

Small young individuals of the bastard halibut are frequently found on the stalls, and are sold under the name of "turbot," which is also applied to another species.

Citharichthys sordidus, Gunther; *Psettichthys sordidus*, Girard.—This species is brought in considerable numbers to the markets of San Francisco, and can be readily distinguished from every other kind occurring on this part of the coast, by the combined characters of eyes and color on the left side; lateral line almost perfectly straight; bony, ridge-like interocular space; and insertion of the ventral fin of the colored side upon the ridge of the abdomen instead of on the same level with that of the blind side.

As is the case with many other species, the number of rays in the dorsal and anal fins is not constant; two specimens obtained upon the same day had respectively D. 93, A. 76 and D. 95, A. 72; while an individual 12½ inches long, obtained on another occasion, had 98 dorsal rays.

In color, this fish is of a dirty yellow, or yellowish brown, with each scale margined with blackish, and the fins speckled with the same.

[Concluded next week.]

Saving Flour Gold.

The Boise *Idahoan* gives the following account of the Lane apparatus in use in the placer claims on Snake river:

From the gravel bank on which the hydraulic plays, runs a grizzly answering to the old sluice box, only instead of a solid wooden bottom, with riffles across, there is a sheet of perforated iron 21 feet long and four feet wide, the perforations nearest the gravel being smaller than those at the further end—the smallest holes are one-eighth of an inch in diameter while the largest ones are three-sixteenth of an inch. The grizzly is set on an incline and supported by legs of graduated length placed underneath. Below this is a proof-shaped platform with the comb running under the length-wise center of the grizzly. Covering this proof-like platform on both sides are the amalgamated plates, each of the upper tiers being 60 inches wide and 240 inches in length. Slightly underlapping these are plates 15 inches wide and 240 inches long, while still below are blankets, with a sand bag running underneath the edges. At the lower end of the grizzly, a tom, made of iron rods or bars is placed at a sharp angle, and under this nearly level trough is the last chance plate, with the sand boxes continued and meeting underneath its extreme edge in the shape of the letter Y, the stem of the Y constituting the sluice box for carrying off the tailings.

The plates are prepared by washing them with a weak solution of cyanide of potassium, and afterwards with quicksilver, when they are ready for service. The water is turned on the grizzlies and the dirt thrown in. The gold and heavy sand fall through the perforations of the grizzly, while the coarse gravel and unproductive dirt are swept by the water over the toms and thence into the sluice box, any stray particles of gold being caught on the last chance plate. A few inches above the plates is a protective grizzly, which breaks the fall of the sand. When the gold and heavy sand are received on the plates the sand is gently washed away over the plates and blankets into the sluice boxes and thence through the tail sluice, while every particle of gold is attracted and held by the quicksilver on the plates. An examination of the sand in the sluice boxes seldom reveals color, and then only when the quicksilver has all the gold it can hold.

Krupp's Electric Lamp.—A recent number of the *Engineer* gives a description and illustration of Krupp's electric lamp, which is said to work very well at Essen. It possesses the advantages of maintaining the ends of the carbon points in a fixed position, so that parabolic reflectors are used, and of regulating automatically the distance between the points. The upper carbon holder, which is quite heavy, is suspended from a disk by means of a jointed chain, while the lower holder is similarly attached to a disk, which is just half the size of the former. The chains are so passed around the disks, that, when the upper holder descends a certain distance, the lower holder will ascend half the distance, so that thus the difference in the rate of combustion of the positive and negative carbon is compensated, and the light occupies a fixed position. In order to regulate the motion of the upper holder a fan revolving in quicksilver is provided. A brake controlled by an electro-magnet acts upon a disk on the same spindle as the two holder disks, and thus regulates the distance between the two carbon points.

Cement for Fixing Metal Letters on Glass.—Copal varnish, 15 parts; drying oil, 5 parts; turpentine, 3 parts; oil of turpentine, 2 parts; liquified marine glue, 5 parts. Melt in a water bath, and add 10 parts dry slacked lime.

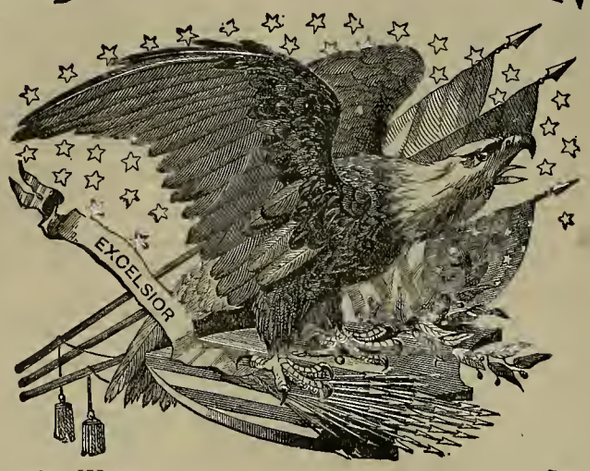
A German dealer in bird trimmings for ladies' hats has just received a consignment of 30,000 dead humming birds, 80,000 corpses of aquatic birds, and 800,000 pairs of wings.

Chinamen are not allowed to enter the new carbonate camp, Leadville, Colorado. Several celestials on their way there have been stopped and turned back.

DEWEY & COMPANYS'

SCIENTIFIC PRESS PATENT AGENCY.

AMERICAN. FOREIGN.



ESTABLISHED IN 1860.

ABLE, FAITHFUL AND REASONABLE.

202 SANSOME STREET, SAN FRANCISCO, CAL.

The Leading U. S. Patent Agency of the West. Send for Circular of Hints to Inventors.

The Pacific Rural Press.

While we cannot promise to labor any more faithfully or earnestly for our readers in the future than we have in the past, we shall endeavor to make the PRESS MORE COMPLETE IN ALL ITS DEPARTMENTS.

Its Editorials

Will be written by able and conscientious writers, and with such judgment and care as to render the journal of the highest usefulness to its readers, and to the permanent welfare of the new and progressive community its columns especially represent.

The Live Stock

Departments—including the horse, horned stock, sheep, goat, swine and poultry interests—will receive constant attention, and our researches for reliable information, which shall be of practical use to our Occidental readers, shall not be limited to any narrow sphere.

The Dairying Trade

Of this coast is yet in small dimension to what it might and should be—to what it is destined soon to be. Intelligent experience; careful experiments; the dissemination of demonstrated facts in regard to the best breeds of stock; information of the best grasses for pasturage for all seasons the best machines and methods for manufacturing; hints for marketing, etc., will be some of the subjects to be treated in an earnest way in our columns, that the RURAL PRESS may well to do its share in advancing one of the most promising industries of the coast.

Our Correspondents

Number some of the ablest domestic writers in the Union, and we are proud to say we would not exchange their co-operative pens for those of any other corps of newspaper correspondents. They are not only friends at heart of our paper, but of the true cause of progressive manhood and womanhood everywhere. The pursuit of

Floriculture and Horticulture

On the Pacific slope presents a field of delightful study, more prolific in novelty and fruitful in profits than awaits the student and laborer in any other portion of the globe. We trust to exchange valuable hints with our florists, vineyardists and fruit-growers throughout the Pacific States

Our HOME CIRCLE department will contain none other than

Chaste Literature

In pleasing variety, calculated to amuse, instruct and elevate both the young and old, boys and girls, who may turn to its columns for pastime and self-improvement.

Our Illustrations

Will be numerous and calculated to please the eye and help the mind to see quickly and correctly many important objects that might otherwise pass their knowledge. Some of them will enable farmers to see and contrast for themselves many kinds of new and important machines and implements. This illustrated feature of our paper, although expensive to its publishers, is an important one to rural readers—especially in a new and rapidly developing country.

The Mind and Health

Of the readers of the RURAL will be cared for in our GOOD HEALTH, USEFUL INFORMATION and DOMESTIC ECONOMY columns. Our GENERAL NEWS ITEMS, NEW INVENTIONS, SCIENTIFIC and MECHANICAL MISCELLANY articles will be continued throughout the year.

Agricultural Notes.

Under this head will be reported weekly, carefully selected and condensed items concerning the agricultural improvements and progress of the various counties and districts of the wide field we represent. The

Information of the Resources

Of this coast, set forth in the various departments of our paper, is not only of important benefit to its readers, but to every property holder on the coast, through the influence it exerts in stimulating enterprise at home and healthy immigration from abroad. There are but few persons interested in agricultural pursuits here who are not benefited annually by our publication above the amount of its subscription price.

Market Reports.

In its commercial departments, the RURAL PRESS will spare no effort to furnish the agriculturist an accurate and trustworthy schedule of the prices which various productions are gaining in the market. We regard this department of our paper as worthy of the most careful and discriminating labor. In our review of the markets we shall present all attainable information concerning the tendency of production of various supplies, and the features of the trade in them. We shall afford all the evidence which can be secured for forming true judgment of the features of agricultural trade and commerce. Although this is a difficult department, we shall especially strive to give the best weekly domestic produce reports in the city.

The Best is Cheapest.

We might fill our advertising columns with high-price

Quack and Swindling Advertisements,

And our reading columns with paid puffs, and thereby be enabled to furnish a large paper at a remarkably low price, but *we will not do it*. We believe our subscribers prefer a good paper at a reasonable price to the so-called cheap papers that trifle with their confidence. Time is precious and patrons will find that reading the cheapest which is most suitably prepared for their special avocation and locality.

A Farmer's Paper Throughout.

We repeat that the PACIFIC RURAL PRESS will continue to be a faithful advocate of the best and highest interests of agriculturists on this coast—according full justice to other kindred industries in conjunction with which agriculture alone can permanently thrive.

We Prepay the Postage

On all papers sent to subscribers in the United States.

SUBSCRIPTION payable in advance. One year, with a premium $4; without a premium, $3.50. Sample copies free to those who will assist in obtaining subscribers.

DEWEY & CO., Publishers.

No. 202 Sansome, N. E. Corner Pine St, S. F.

The Mining and Scientific Press.

THIS PUBLICATION, SO VALUABLE FOR MINERS, MECHANICS, SCIENTIFIC AND INDUSTRIAL MEN,

Is now in its THIRTY-EIGHTH Volume. It has ever been, and will continue to be, the aim and object of the publishers to make the PRESS

A Practical and Interesting Journal.

To this end, we aim, through the constant watchfulness of our editors and correspondents, to seize upon everything new in the way of mining and the various processes connected with the saving and separating of the precious metals, and to place the same before our readers at the earliest day. It has been well said that

A Newspaper is a Window

Through which men look upon all that is going on in the world. Our window is a special one, so placed and arranged as to bring within the scope of its vision all that is going on

In the World of Mining, Mechanics and Science.

Without a paper of this kind, the miner or mechanic is shut up in a small room or shop, and can know but little of what is going on in the world around him in relation to his particular calling. In this age of rapid progress books are necessarily slow and behind the times. It is only through papers devoted to the specialty which he has chosen that one can be easily apprised of the discoveries and improvements which are constantly being made by his fellow workers, and without a knowledge of which he soon becomes a laggard in the race.

The Value to the Community

Of such publications in disseminating important information, in checking useless and exploded experiments, and in instigating important enterprises, can scarcely be overrated. Through them the readings and observations of thousands are collected and collated, and brought directly to the shop or table of the reader without any effort of his own. For a mere trifle of cost he is regularly furnished with an encyclopedia of just the information he needs—an unbound book forever issuing but never finished.

Nowhere in the Wide World

Is such an aid more needed than by the miner of California. It is needed alike in the mill, in the mine and in the placer. We have here

The Largest Mining Field on the Globe,

Embracing a variety of minerals nowhere else found within the boundaries of a single field. We have here, also, men gathered from every quarter of the globe, bringing with them the collective wisdom of the world,

Useful, Practical and Directly from the Field

Of labor. The mustiness of books has been brushed away, and their minds are stored not only with the experience of the past, but also with the practice of the present. It is to this fact that we are indebted for our present

Able List of Correspondents,

Through whom we are able to promise to our readers so much that cannot be collected in the mere routine of office work. By the aid of such help our editors will be able, during the coming months, to do more than ever in furnishing information which shall be

Fresh, Novel and Interesting,

And which shall comprise all that is known of the latest and best means for saving gold and silver and for economizing labor and cost in that direction.

Our Illustration Department

Will still always form an important feature, and no effort will be spared to make it of the greatest possible local and general interest to our readers. The important matter of

Home Manufactures and Inventions

Will also largely occupy the attention of the publishers and editors, and will be constantly encouraged, as an important means of furnishing employment to those who are seeking our shores, and adding to the wealth of the Pacific coast.

The Large and Increasing Circulation

Of a journal thus devoted exclusively to useful and practical information, speaks more in our behalf than anything we could say of ourselves, and is an encouragement to its further increase, especially in these times of trifling and trashy journalism.

The class of readers who are interested in such a publication as this have no need to be any thing more than merely reminded that such journals are necessarily more costly than those of a lighter class, such as are read by the "million," and thrown aside as soon as read. Considering the character and location of the MINING AND SCIENTIFIC PRESS, our rates are as favorable as can possibly be afforded and do justice to the great industries in aid of which we are laboring.

SUBSCRIPTION—$4 a year, in advance. Samples free to those who will assist in obtaining subscribers.

DEWEY & CO., Publishers.

No. 202 Sansome, N. E. Corner Pine St., S. F

Scientific Press Supplement.

A MONTHLY BULLETIN OF PACIFIC COAST SCIENTIFIC REPORTS, RESEARCHES, ETC.

The aim of the publication is to gathor and present in a convenient and durable form all the valuable scientific matter practicable, in a publication specially representing scientific development in this comparatively new and rich field of observation and discovery.

It forms a select medium through which all sciontific writers on the coast may co-operate in publishing their thoughts and investigations to the scientific world in a befitting dress and manner.

It is well printed on good paper and furnished at the reasonable price of $1.50 por annum, postage paid. Single Nos., 10 cents. [Copies for extra circulation can be orderod in advanco for $5 per 100.]

It is issued in the early part of each month. Each number will contain eight or more pages.

The editors and publishors will aim to make such a publication as the scientific and progressive men of this coast will support cheerfully and take pleasure in sending to their friends and correspondents in all parts of the civilized world.

The SUPPLEMENT is an independent publication, and will not be mailed to subscribers of the "Mining and Scientific Press" unless paid for as a separate subscription.

DEWEY & CO., PUBLISHERS,
Office Mining and Scientific Press, No. 202 Sansome Street, San Francisco.

Single samples will be mailed from this office for 50 cents, postpaid. Wholesale and retail agents wanted.

THE BEST FILEHOLDER.—After having used Dewey's patent elastic hinge fileholder for over a year past, the *News* cheerfully indorses it as the best newspaper fileholder in existence, possessing important advantages over any and all others in use. The holders are neat, light and convenient, and the newspapers are placed in them with the utmost facility and least possible time and exertion. They are the simplest, handiest and cheapest of all. Anybody keeping files of papers in reading rooms, offices or at home, should send at once to the proprietor, A. T. Dewey, San Francisco, and get the only proper fileholder. Samples by mail fifty cents.—*Gold Hill News.*

Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued. wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,

MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their respectivo Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, $2.50 coin, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequaled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, $7.50.

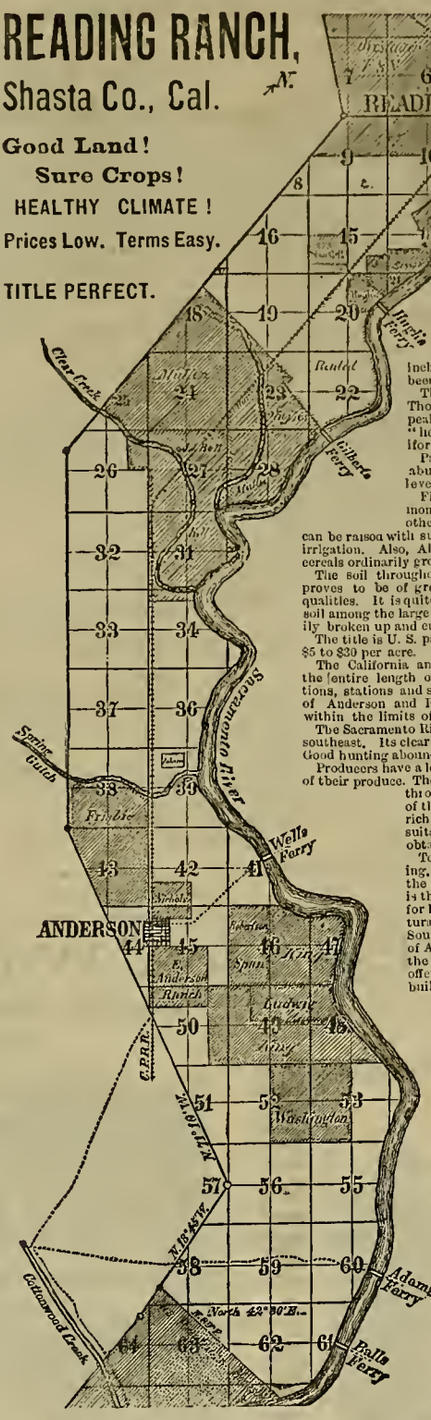
PROMPT AND SUCCESSFUL.—*Messrs. Dewey & Co:*—Gentlemen: Your Circular letter, 12th inst., informing me of successful termination of my applicatiou for patent received. Please accept thanks for the prompt and successful manner in which you have managed this business Yours respectfully, J. H. CAVANAUGH.
Walla Walla, Dec. 24th.

Look Out for a Good and Cheap Homestead on Easy Terms, Where Crops Never Fail.

READING RANCH,

Shasta Co., Cal.

Good Land!
Sure Crops!
HEALTHY CLIMATE!
Prices Low. Terms Easy.
TITLE PERFECT.



The Reading Ranch, in the Upper Sacramento valley, originally embracing over 26,000 acres of choice grain, orchard and pasture land, is now offered for sale at low prices and on favorable terms of payment, in subdivisions to suit purchasers.

The ranch was selected at an early day by Major P. B. Reading, one of the largest pioneer land owners in California. It is situated on the west side of the Sacramento River and extends over 20 miles along its bank.

The average rainfall is about 30 inches per annum, and crops have never been known to fail from drouth.

The climate is healthy and desirable. The near proximity of high mountain peaks give cool nights during the "heated term" which occurs in our California summers.

Pasturage, wood and good water are abundant. The tillage land is mostly level, with complete drainage.

Figs, Grapes, Peaches, Prunes, Almonds, English Walnuts, Oranges and other temperate and semi-tropical fruits can be raised with success on most of the tract without irrigation. Also, Alfalfa, Vegetables, Corn and all other cereals ordinarily grown in the State.

The soil throughout the tilled portions of the ranch proves to be of great depth and enduring in its good qualities. It is quite free from foul growths. The virgin soil among the large oak trees on the bottom land is easily broken up and cultivated.

The title is U. S. patent. Prices range principally from $5 to $30 per acre.

The California and Oregon railroad traverses nearly the entire length of the tract. There are several sections, stations and switches, besides depots at the towns of Anderson and Reading, all of which are located within the limits of the ranch.

The Sacramento River borders the whole tract on the southeast. Its clear waters are well stocked with fish. Good hunting abounds in the surrounding country.

Producers have a local market, which enhances the value of their produce. The railroad transportation route is level throughout to San Francisco. A portion of the land is auriferous and located near rich mines now being worked. Land suitable for settlers in colonies can be obtained on good terms.

Town lots are offered for sale in Reading, situated on the Sacramento river, at the present terminus of the railroad. It is the converging and distributing point for large, prosperous mining and agricultural districts in Northern California and Southern Oregon. Also, lots in the town of Anderson, situated more centrally on the ranch. Lots in both these towns are offered at a bargain, for the purpose of building up the towns and facilitating settlement of the ranch.

Purchasers are invited to come and see the lands before buying here or elsewhere. Apply on the ranch, to the proprietor,

EDWARD FRISBIE,
Anderson, Shasta Co., Cal.

P S.—Send postage stamp for illustrated paper containing information about Shasta county and these lands, and say advertised in this paper.

Location of Shasta County.

Shasta County lies not far from midway between the two most important ports on the Pacific shore, *i. e.*, San Francisco and Portland, Oregon, and directly on the overland route, which in the future will become the grand thoroughfare from Mexico to British Columbia. The town of Reading, at present, and probably for years to come, the head of railroad transportation on the California side of the mountains interveuing below Oregon, is distant from San Francisco by railroad (via Vallejo) 255 miles; from Sacramento City, 109 miles; from Marysville, 117 miles.

Several thousand acres of desirable Wheat, Barley, Oat, and other farming land for rent at a low cash rate or on shares. Crops never fail if sown by the first of March. Visit the premises or address as above. San Francisco Reference—PACIFIC RURAL PRESS Office, 202 Sansome Street.

MACHINERY, BUILDINGS, PORTRAITS, LANDSCAPES, TRADE-MARKS, LABELS, SEALS, MONOGRAMS, etc

DESIGNED AND ENGRAVED
IN THE HIGHEST STYLE OF THE ART.

Notes on Shasta County and the Reading Grant.

The town of Reading, on the Reading grant, is situated at the present terminus of the Northern Branch of the C. P. R. R. It is a large and thriving place. Anderson is situated in the middle portion of the grant, surrounded by fine farming land. It is a substantial growing town, certain of a prosperous future.

The largest body of fine farming land is along the river from near Cottonwood to a point near Reading, embracing originally 26,000 acres, and known as the Reading grant. The different kinds of soil found in the county are well shown here. A portion of the grant is moist enough for summer vegetables or winter potatoes, the greater portion is the finest of wheat land, producing a crop every season; some of it is a red upland similar to the fruit lands of Placer county, and unsurpassed for orchards and vineyards Most of the bottom land of the grant is dotted over with white oaks of the largest size; there is little undergrowth.

Being away from any broad belt of settled lands, this fine tract, which possesses less drawbacks than nine-tenths of the farming lands of California, has seemingly had its merits overlooked. The purchases made upon the tract have hitherto been mainly by persons living in the mountains above.

Wood and water are plentiful and easy to get. Oak timber is in the majority. Good well water, unfailing in quantity, is reached in from 10 to 35 feet, according to location. The drainage is such that very little damage is ever done by the heaviest floods. All the surplus water drains off in a few days. Good roads for hauling extend all over the Reading grant. The situation of the grant is such that its future population can easily combine and furnish additional facilities for transportation by narrow gauge railroad and river navigation, if occasion should require.

For raising wheat, oats, barley, corn, beans, melons, beets, peanuts, sweet potatoes, flax, hops, all kinds of fruit, various vegetables, and in many places alfalfa, no irrigation is required. However, the opportunity for irrigating almost the entire tract of the Reading grant is most exceedingly favorable from the Sacramento river, or from Clear creek and other sources.

One of the advantages which the small farmer in Shasta has over his fellow farmers elsewhere, is in the fact that he has the monopoly of a very lucrative home market. The mines and lumber mills are constant consumers of all he can produce in the way of grain, hay, beef or pork.

The main valley and the lower hills are blessed with a healthy and invigorating climate. The mean summer temperature of Reading is 64° 14', or nearly 3° warmer than Livermore. The mean temperature for the coldest month is 46° 72', or 12' warmer than San Jose. These figures are taken from B. B. Redding's able report on the culture of the olive.

The two palm trees now growing in an orchard near Wiser's vineyard, two and a half miles east of Shasta City, were planted by Mr. Swazey, of Shasta, some 20 years ago. The largest is now 37 inches in diameter at four feet from the ground. The variety is that known as *Pritchardi filamentosa*. Young orange trees may be found in various parts of the county, several having borne fruit. At the Tower house are some of the finest walnut trees in the State, and choice orchard of all the standard varieties. Figs and peaches are of unusually good quality, and the winter apples keep from one to three months longer than the same varieties in the San Jose valley. Almonds have hardly been tested. The hard-shell is found everywhere, but only a few trees of the soft-shell can be found. The olive will undoubtedly succeed. Much of the fruit has been seedling, and little care has been taken of the orchards; but a better spirit prevails, and many trees are being planted. There is a fine field open for the first man who will grow small fruits, straw berries, etc., for the mines. A few are brought from Sacramento, but they arrive in poor condition.

In the matter of hay, the Reading market ranges from $18 to $24, and has been up to $30, the local supply not being large enough, and much has been brought from Tehama county. Some experiments with alfalfa, on both upland and lowland, have resulted favorably, and it appears that it will grow without irrigation, if the ground is deeply and well prepared..

The question of health is of so great importance that we made particular queries on this point. Healthier people than Shasta county furnishes are not to be found anywhere, nor is there any malaria along the Sacramento within the county limits.

The advantage above all others which is just now turning the attention of stockmen, small farmers and orchardists to Shasta county is in its abundant and unfailing rainfall.

The local market has hitherto taken all the hogs raised, at good figures, about five and one-half to seven and one-half cents live weight. This all goes into the mines and some pork is even brought from Tehama and other points south.

On the whole the advantages of this county, are, first, diversified interests; second, local and increasing markets; third, healthfulness, rainfall, fine scenery, etc., and its development is only a question of time

"Visit this section of our State and see for yourself," is good advice, which can be regretted by but few, if followed by those who wish to settle on the Pacific coast from other parts of the Union, or by those who wish to change their location in California.

UNITED STATES
Mineral Land Laws, Revised Statutes
AND INSTRUCTIONS AND FORMS UNDER THE SAME.

We have just issued a pamphlet containing the General Mineral Land Laws of the United States, with instructions of the Commissioner of the Land Office. The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with Instructions by the Commissioner of the Land Office; Mining Statute of July 26th, 1866; Mining Statute of July 9th, 1870. Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Surveys; Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Registers' Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Publication; Affidavit of $500 Improvements; Statement and Charge of Fees; Proof of Ownership and Possession in Case of Loss or absence of Mining Records; Affidavit of Citizenship; Certificate that no Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, postfree, for 50 cents. It should be in the hands of every one having any mining interests. DEWEY & CO.,
Publishers of the MINING AND SCIENTIFIC PRESS, S. F.

Acknowledgement and Thanks.

LAKEPORT, Lake Co., Cal., Nov. 2d, 1878.

MESSRS. DEWEY & CO.—*Gentlemen:*—I hereby acknowledge receipt of patent, for which please accept my sincere thanks. When I have any further business in this line I shall certainly employ you. With kind regards, I am, Yours very truly, CHAS. SLATTERBECK.

Jackson's Agricultural Machine Works,

S. E. Corner 6th and Bluxome Sts., San Francisco.

To Practical Threshermen
— AND —
FARMERS!

GENTLEMEN: — The undersigned having removed his Machine Works, established in 1872, known by the name of Yolo Planing Mills and Machine Works, from

Woodland to San Francisco,

And erected a larger and convenient Factory, with all of the facilities necessary to manufacture a complete Threshing Outfit, respectfully solicits your patronage.

If you have any new ideas you wish to develop, inventions you wish to introduce, or alterations and improvements you wish to make on your old Machines, please bring them to my Works, and I will give you the benefit of my large experience with experimental Threshers, and do your work at the

LOWEST RATES.

Every Thresherman and Farmer on this Coast feels and knows of his own knowledge the want of a more economical Threshing Outfit. One that is less wasteful, less expensive in annual repairs and running expenses, and the first cost within the reach of the small Farmer. With the view of supplying this want and producing a Machine especially adapted to this Coast, I have established the JACKSON AGRICULTURAL MACHINE WORKS, and respectfully solicit suggestions and opinions and the patronage of the practical Thresherman and Farmer, and offer you my best attention and skill. Also to the inventor I offer my services, and solicit your patronage. Will make experimental Machinery to order, and will manufacture meritorious patented Machinery on royalty, or purchase the patents on reasonable terms.

Address all communications,

BYRON JACKSON,
S. E. Corner of 6th and Bluxome Streets,
SAN FRANCISCO, CAL.

Jackson's Patent Feeder,
FOR THRESHING MACHINES.

The Feeder is adapted to either Steam or Horse-Power. Will feed mowed Grain or Mustard, no matter how long. Headed or reaped Grain, no matter how weedy.

It will thresh cleaner than by hand feed.

It will save the labor and board of one man (on large Machines two), besides it will do more work and better work, as it never gets tired.

The Elevator.

The Elevator in the New Machines is attached by a knuckle shaft, and driven by a mitre gear from the Feeder. All journalled in one solid box-banger, with gears neatly covered from the dust and straw.

Both Feeder and Elevator are driven by one large pulley, fitted with a friction clutch to stop and start the Feeder at the will of the operator.

The whole arrangement is so simple, compact and durable, that the additional machinery added by its use can be no objection, when compared with the great advantages gained.

1st. Room to spread the feed.

2d. Less danger from the forks, or of being knocked into the cylinder.

3d. Getting away from the dust.

4th. Getting the Separator away from the stacks.

5th. Time saved in setting.

6th. Saving the foreman the annoyance of crawling under the Separator to set it, or running around the stack to communicate with the engineer.

7th. The Engineer can see everything connected with the Machine, or crew, thus avoiding many accidents.

8th. The sacks can be piled on either side of Separator.

9th. The opportunity of using a low derrick table. The importance of this low table cannot be overestimated. It saves the three main items in the harvest field: TIME, LABOR and GRAIN.

Address

BYRON JACKSON,
Southeast Corner 6th and Bluxome Streets,
SAN FRANCISCO, CAL.

JACKSON'S
Improved Portable Derrick.

(Patented January 23d, 1877.)

This consists of four upright pieces, framed in two sections to stiffen the uprights, and fastened together at the top with one heavy bolt, and two of them hinged at the bottom, so that one section will fold inside of the other and lie down smoothly on the table.

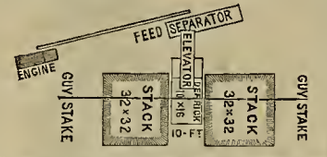
The Derrick, when in working position, is light, and very stiff and strong, and does not require taking down to move, except to pass under obstructions, or for conveniences on long journeys.

Two Guy Ropes only are required to hold it while at work. The top and bottom pulley blocks are each hung with swivels to prevent chafing the ropes.

The Derrick can be put on to any platform, and will be sold separate if desired. Price, $50.

The advantages of this Derrick are: convenience, durability, lightness, strength and absolute safety.

The tablemen stand between the uprights, and it is impossible to hit them with the Forks, so they lose no time in watching the Forks to keep from being hurt. Price, $30; Derrick complete with blocks, ropes and two forks, $175.



The above diagram shows the proper position for the Derrick, Separator and Engine when using the Feeder and Elevator, and the proper size and shape of stacks.

This plan is much better than stacking the same amount of grain in one stack 35x60, and using the Derrick on one side.

These sizes are the largest I think profitable, because the Forks cannot be pulled over 30 feet, and supply a Self-Feeder with two Forks. If the straw is short, they had better be smaller. Address

BYRON JACKSON,
S. E. Corner of 6th and Bluxome Streets,
SAN FRANCISCO, CAL.

JACKSON'S
Light-Weight Fork.

Is only half the weight of the Clumsy Forks now in use, and yet Stronger and more Durable.

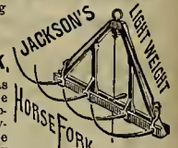
It is neatly constructed of a light frame. The head formed of two pieces, one each side of the frame. The tines passing through them and the several pieces of the frame, locking the frame firmly between them, and by means of a light iron brace from each tine to the frame. The strain in lifting the load is brought to bear straight with the grain of the wood in the several pieces of the frame, having no twisting strain on any portion of the Fork. The two head-pieces serving only to space the tines and stiffen the frame. The latch spring is protected so that it never fails to do its work.

The bail is so protected by the frame that it is not subject to being bent out of shape, and is made very light.

In short, this Fork is constructed upon common sense scientific principles, *and every ounce of weight left out that is not needed, weighing only 35 to 40 pounds, while those now in use weigh from 60 to 75 pounds.*

It is marvelous that men will use and be satisfied with so clumsy and heavy an implement, when one so remarkably lighter can be as easily made. Let us estimate the saving per day by the use of the Light-Weight Fork, basing our calculations on 1,000 loads per day to supply a Thresher, 20 feet the average distance to move the grain, 30 pounds the difference in weight of the Fork. Thirty pounds moved 20 feet 1,000 times equals 30,000 pounds moved 20 feet each day; or, in other words, 30 pounds dragged at the end of a rope four miles in addition to a hard day's work in the hot sun. This is a low estimate of the practical saving by using

JACKSON'S
Light-Weight Fork,



It is an old saying that it was the last straw that broke the camel's back, and it is very applicable in this case. By leaving off the last 30 pounds in the weight of the Fork and giving it the proper shape, plenty of men can be found to operate it at reasonable wages. Address

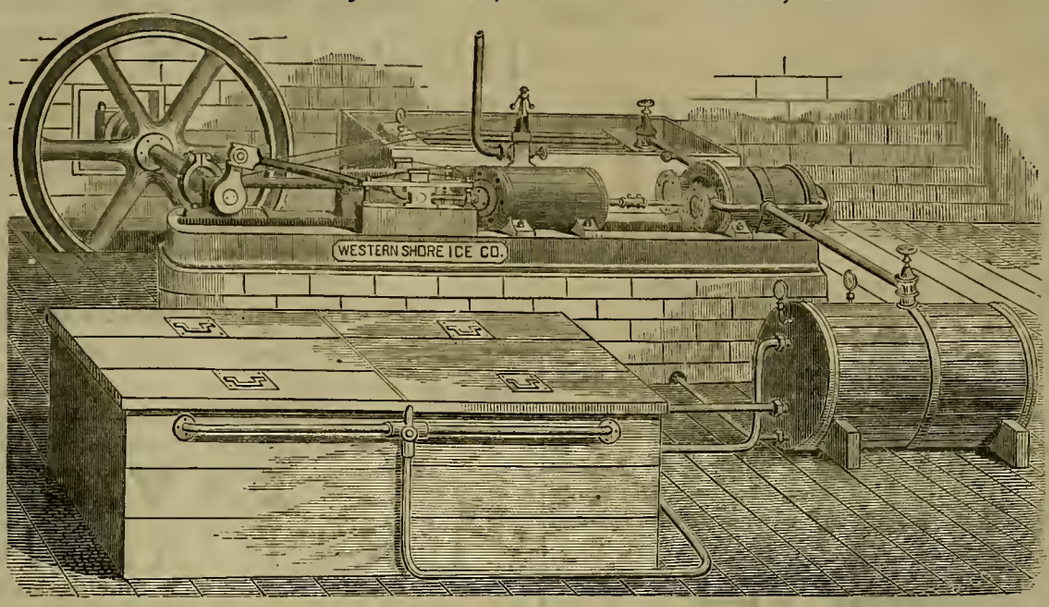
Mill Stones balanced.

THE WESTERN SHORE ICE COMPANY.

821 Battery Street, San Francisco, Cal.

This Company having acquired from H. J. West, of London, the sole and exclusive right to manufacture and sell on the Pacific Coast his world renowned ICE-MAKING AND REFRIGERATING MACHINES, are prepared to supply the same to Hotels, Restaurants, Clubs, Breweries, Country Towns and all manufacturers and consumers of Ice on this Coast.

A one-ton Machine will manufacture clear Ice in blocks of any desired thickness, from three inches to four feet and upwards, at a cost of *one-quarter of a cent per pound.* A twenty-ton Machine will manufacture the same description of Ice at a cost of *one-twentieth of a cent per pound.* In cases where power is already on the premises, the cost of manufacture will be less than one-half of the above figures. These Machines have obtained the First Class Prize Medal at the Great Exhibition in London of 1862; the Prize Medal at the Vienna Exhibition of 1873; and supplied Ice at the late Paris Exposition. Many valuable improvements have been recently made, and they are now acknowledged to be the most complete and economical Ice-Making Machine in the world. Apparatus has already been constructed under these patents, which is now in successful operation in Great Britain, India, and New York, equivalent to the manufacture of a *million pounds of Ice daily.*



The accompanying drawing illustrates one of the patent transparent block-ice making Machines manufactured by the WESTERN SHORE ICE COMPANY. To this apparatus a very plain and simple Steam Engine is attached for working the Air-Pump. This is made direct-acting, by which means the use of all belts or gear-wheels is avoided. Where, however, a separate motor exists, the Machine may be had without the Steam Engine, in which case there is of course a reduction in the cost.

Patent Refrigerating Apparatus.

BREWERIES.—The eminent success which has attended the introduction of this patent apparatus is ample proof of its great superiority over every other known invention of the kind. The most eminent brewers in the world, including Allsop & Sons, Truman, Hanbury, Buxton & Co., and Guinness & Co., have adopted this system, and have eleven of these Machines of the largest kind in use, while 38 of them are employed in various other Breweries in Great Britain.

Among the various other purposes for which this new patent machinery is valuable, are the cooling of air or liquids, preserving meat, fish, vegetables, fruits, etc., cooling Hospital Wards Theaters, Dairies and for all purposes where a low temperature is desired.

The WESTERN SHORE ICE COMPANY are prepared to supply Refrigerating Machines of a capacity for cooling from 50,000 to 500,000 cubic feet of air per hour to 30° Fahr.

For circulars and particulars as to prices and any other information desired, apply to the Secretary of the

[Written for the Press by W. H. S.]

The Big Bug Mining District

Is located about 25 miles southerly from Prescott. It is reached by a good road down the Agua Frin, called the Black Canyon road, thence by a side road to Big Bug creek and mines.

This creek runs nearly east nud west. The principal mines in this district are situated on the south side of a range of mountains that run along the north side of Big Bug creek, in what may be called an open canyon, which is easy to reach with loaded wagons at all seasons of the yenr by the road I have described.

Those mines nre peculiarly well situated on account of their necessihility nnd the proximity of wood and n fair supply of water obtainable for most parts of the year from Big Bug creek, a runuing stream heading in the mountaius at the upper end of the cauyon, where there is heavy pine timber in abuodauce both for mining purposes nnd general use. It is the intention of Prof. Cherry, who is opening some of the old mines here and developing new oues in the interest of Chicago parties, to put iu a saw mill to cut lumber, not only for their own use but also for the general market. He also expects to have a 10-stamp gold mill at work on these orea in a short time.

The principal mines centering upon Big Bug creek are the Eugenia, Orion, Middlesex, Wormsers, Pride of Big Bug nnd Rock Island, which are on one continuous ledge proapected and worked to some extent for 9,000 feet. This may he called the npper ledge, on the south side of the divide already mentioned, of the range north of the creek. Lower down nnd nearer the creek is another ledge runniog parallel to the upper one, and plainly traceable for 8,000 feot. On this ledge nre located the Mny and Grace, Amity, Isabella, Isabelln Extension, Luella and Crown Point. Higher up, but still on the southern slope and a little to the east, will he found the Big Bug mine, St. Ursula, Oversight, Vulcan and Ironsides. The St. Ursula seems to be a continuation of the Big Bug ledge, the others apparently parallel ledges. Over the divide, on the north side of the range, are located the Ticonderoga, Independence, Galena and Dividend. These are all gold mines, and the Big Bug, Eugenia, Orion, Amity and Isabella, have been worked to a considerable extent and a large amount of bullion taken out. The Big Bug ore assumes some peculiar forms, running into a very dark color nearly as black as anthraeite coal, and abounding in beautiful quartz crystals and iron cubes. The Vulcan is an iron-capped mine and abounds in copper and froe gold. The Rock Island shows a strong ledge of white quartz, but has not been opened to any great extent. The mines on the lower ledge are of decomposed quartz permeated with iron stains. In fact iron, in various forms, is a prominent feature in most of these mines.

Still further north, where the range drops away into the valley of the Agua Fria, are located the Kit Carson, Silver Flake, Silver Belt, Ida May, Agua Fria and Agua Fria North. The engraving will show the location of the principal mines.

These are all silver mines. The Silver Belt is opened by a shaft to a depth of more than 100 feet, and hy several drifts on different levels. The vein is small, but rich in sulphurets and born silver, and stroog io galena. The ore is being worked nt the Agua Fria smelter, about three miles from the mine, where plenty of water is obtainahle at all seasons of the year. Most of the other mines of this group have been well opened, but little or nothing is being done upon them at present. Both sides of the divide nppear to be seamed with mineral-bearing veins, their generai direction heing northeast and southwest.

The mines on Big Bug creek were operated during the era of Indian hostilities by Hitchcock & Gray, and to illustrate the enormous expense incurred in working them at that time, it is said that 35 cents n pouud represented the average price charged for everythiug in the nature of supplies, whether it was flour, beans or baeon. A ten-stamp mill which they built there cost them, I was told, $75,000. A better one could be put there to-day for less than $10,000. The miners in those days were kept constantly on the alert by Indian raids, and many a bold pioneer and venturesomo prospector met his death at the hands of the wily savage and now sleeps in somo nameless grave on mountaiu side or iu deep canyon. They were brave, hardy men, the advanco guard of civilization, and little thought they would so soon bo followed by the stago coach and mail, then by the railroad with its drawing-room cars and the telegraph with its lightning messages, opening up these rough and rugged hills and isolated valleys to all the world.

DIAGRAM SHOWING THE LOCATION OF SOME OF THE MINES OF BIG BUG DISTRICT, ARIZONA.

Truth to Home Seekers.

The telegraph has been laden during the week with accounts of n widespread movement among the blacks in aome of the Southern States toward the prairies of Texas and Kansas. Inspired by the idea which has been industriously promulgated that in the new States they would be much more happily and prosperously located, these ignorant nnd poor negroes have taken up an hegira from their old homes and throng all avennes of transportation through Arkansas and Missouri. They are moving hy the thousands, and most of them are so poor that they can but half make the journey they intended. Homeless and hungry they have filled St. Louis, unable to go farther, unable to return, unable to live where they are, save by the hand of charity. The spectacle is a sad one to contemplate. The South is robbed of her needed lahor element; the West is not enriched by a legacy of paupers. Mistakeo, misguided, doubtless imposed upon by some heartless people who had money to make from land sales or transportation, this throng of Africans has lost one home without gaining another, and the homeless ones are a burden to themselves and to the places into which they have come.

This is an aggravated case of unfortunate spread of emigration fever. It is comparatively easy to start the disease. Glowing descriptions, unqualified promises, visions of El Dorados inspired hy printed accounts or voiced by hired speakers, will stir an old established community to its foundations, and as the venturesome spirit rises it impells to motion hoth those who should and those who should not move. It is a matter of great moment to many fellowmen. No one who has a spark of humanity will engage in any movement which carries its points by propagation of rose-colored and partial statements, calculated to excite people from happy and prosperous homes. There is only one true way to present the claims of any part of the footstool which it is desired to populate by emigration from the older settlements, and that is to set forth the exact truth. No desirability of location and natural advantages is so pure that it has no qualities of less or opposite character. No success should be described without due connection of the price and effort at which success is attained. No skillfully painted picture which conceals the rough natural objects from the landscape is true to art; rather is it the triumph of the artist to depict these, that nature's balance of the rough and the smooth way be maintained. Thus it is with truth. Let us have it absoluto. Let it present the facts of a location or an industry as they exist. For men's affairs are much na nature's work; both have their favor and disfavor, their sun and storm, and he who represses either from his representatiou is false to himself and an enemy to his fellowmen. In such matters do not let self interest crush the humanity out of man. It is a serious thing to influence a fellow-being, and he only can do it with a clear conscience, if he have a conscience at all, who makes whole truths his instruments, and truth itself his guide. This is true, even in the passing events of a day's importance, and a thousand times more true when applied to matters which may turn the course of lives. A home, to him who has one, is too happy and important a thing to unsettle, unless the act is done with full view of the probabilities which the change involves.

And this question, fortunate for it in this gold-struck age, has other grounds than those of abstract morals and humanitarism on which to urge its claims. It is plain from the experience of all new communities that those incomers are most valuable who arrive with temperate views of local advantages and full confidence that success is a thing to be labored for. These are the men who meet their payments for lands, who surround their homes with valuable improvements; in short, build up the community in permanent growth and increase. The wild, the visionary, the volatile, caught by the glare of roseate representations, fade and vanish before the test of actual and persistent endeavor, even in situations where endeavor ripens fruit most quickly. Sorry indeed it is for them that they were ever tempted from the confines of their native towns. But oot alooe those naturally volatile and visionary are caught by the unscrupulous persuader. Earnest, honest men are often led to sacrifice a measure of prosperity in order to obtain promised fullness, but which they fail to reach because they cannot surmount the difficulties of the task under new conditions. These men too had better been spared the change, and often full truths would have dismayed and discouraged them from fruitless undertakings.

Reduction Works for Sale.—An advertisement in another column announces that the Melrose Reduction Works are offered for sale. These works were erected at considerable expense. They lie beside the track of the Central Pacific railroad, and are consequently very accessible. The property is worth the attention of any who wish to invest in this line.

Buffalo Ranches.—Now that it has been shown that the wild buffalo can be domesticated and made as servicable as the ox and the cow, a Black Hills paper suggests that the Yellowstone and the Big Horn valleys be used as reserves for raising these animals.

Present Aspect of the Quicksilver Question.

The combination proposed for restricting the California product of quicksilver, referred to by us a few weeks since as having been about perfected, seems to have failed of a final consummation. The scheme however without being abandoned, remains *in statu quo*, with the chances in favor of its being ultimately carried out At the time alluded to every considerable company in California was understood to have given in their adherence to the plan except one, whose active representative was then absent from the city. On his return this party, contrary to general expectatiou, declined to come into the arrangement, thereby necessarily causing its further postponement, a single large company refusing to co-operate being sufficient to render the scheme inoperative. One of the reasons assigned by this party for holding aloof from this association of producers was, that there were then many lots of quicksilver being held by outside parties in London, and which, the moment any advance in prices occurred here, would be at once thrown upon the New York market, supplying the Eastern demand to the exclusion of the California product. This objection, which seemed well taken at the time, has since been deprived of its force, these second-hand lots having lately been about all cleared off, leaving the Rothschilds, as aforetime, sole masters of the London market.

Notwithstanding we see it stated that these merchant princes have agreed to lay down this article in New York free of expense, at £6 per flask, scarcely 39 cents per pound, there is little doubt but they may be induced to co-operate with these California compauies in an effort to save the business from ruinous or even profitless competition. In this view of the sitnation the chances for bringing about some concerted action looking to that end are certainly greater. Under ordinary circumstances the Rothschilds have a practical monopoly of this metal on the other side, the Spanish government having mortgaged to them the product of the mines of Almaden for 30 years, 21 of which remain unexpired. Under this agreement the minimum price to he received by the government is £6 per flask. How then the purchasers are to deliver it in New York at that figure will be a puzzle to the mercantile mind, inasmuch as they must be out of pocket hy the transaction to the nmount of commissions, freight and insurance, at least. This is not the way the Rothschilds are apt to do business, forciug us to conclude that there must be some mistake in regard to the above statement.

Never as yet has the price of quicksilver fallen as low as £6 in the London market, the lowest quotations, at least for many years past, being £6 17s, which figures ruled for a portion of 1868-69. For a long time the London and San Francisco markets have been in such close sympathy as to warrant the belief that they can, with a little good management, he maintained in harmony instead of becoming antagonistic to each other. Being duty free the prices at which this commodity has sold here and in England have corresponded very nearly throughout a long series of years. The rates at which quicksilver can profitahly he made in this State and at Almaden, the principal mines in Europe, do not greatly differ; for while they have at the latter cheaper labor and richer ores, we enjoy the advantage of more mines and a large home market. As the large companies in California and this English house virtually command the quicksilver markets of the world, it is altogether likely that they will be able to agree upon a policy which, while it keeps the demand fully supplied, will save themselves from dead loss.

At a late meeting of the Bullion club, in New York, Col. Dean expressed the opiuion that the leading managers on the Comstock had knowledge of the existence of three valuable ore bodies recently developed on that lode.

Barlow J. Smith. M. D.

Consulting Physician,

Professor of Phrenology and Mental Hygiene.

Proprietor of the Smithsonian Medical and Phrenological Institute, 635 California Street, above Kearny.

This Institute, by combining medical hygiene with the various Water Cure treatments and the most powerful Electrized Horseshoe Magnet in the world, claims to cure speedily and permanently all forms of acute or chronic nervovital derangements, Brain, Spinal and Heart diseases, St. Vitus Dance, Palsy, Epilepsy and all Rheumatic. Liver and Kidney troubles. The institution has for the past 20 years made a specialty of treating all forms of weaknesses and diseases peculiar to males and females. By the use of hygienic remedies and electro-motorpathy the worst forms of impotency and seminal weakness in males and sterility in females are speedily and permanently overcome. Hygienic board, with or without rooms. Terms moderate. Electro-thermal, Russo-Turkish and Medicated Baths given daily.

Mrs. Dr. Smith as Matron has charge of the female bathing department.

DR. SMITH has practiced Phrenology the past 30 years, and during the last 20 years has been constantly using the science connected with Physiognomy, in examining or diagnosing disease in this city, and claims to have made discoveries in the SCIENCE of Phrenology that enables him, by an examination of the head, even blindfolded, to determine the disease to which the person is constitutionally subject, or whether the disease at the time afflicting the person, is the result of accident or hereditary weakness; whether CONSUMPTIVE, DYSPEPTIC, RHEUMATIC, APOPLECTIC, NEURALGIC, LEUCORRHŒAL, or SEMINAL. Especially does the form of the head indicate the strength of the uterine, genital or reproductive system. The head is also an index of the natural strength of the lungs, heart, stomach, liver, kidneys, spleen, back or verebra, and it determines the power of the system in warding off and overcoming disease of all kinds.

Ladies or gentlemen, desirous of obtaining a thorough and correct Phrenological examinations with Fowler and Wells' charts, will meet with a respectful reception at his consulting rooms. Parties can depend upon a reliable delineation of the character of their intimate male or female friends, by presenting a clearly defined photograph.

Phrenological or Physiognomical examinations without charts, $1.50; with charts, from $2 to $3.

INVITATION TO INVALIDS

And all persons who are in any way out of health, who desire to know the nature and causes of their disease, may avail themselves of an examination through phrenology in regard to health free of charge, between the hours of 9 A. M. and 3 P. M. Sundays from 9 A. M. to 12 M.

SAVE YOUR GOLD!

Highly Important to Miners and Quartz Mill Men!

SILVER PLATED AMALGAMATING PLATES.

The best process yet discovered for saving fine or float gold. Extensively used with great success in gravel and placer mining in various parts of the Pacific Coast. Over five hundred orders bave been filled, and the demand is constantly increasing. A large number of these Plates were sent to Snake River mines, Idaho, last year, and a great many orders are being filled for them this season. Circulars containing full instructions for working these Plates sent with each order. Old Mining Plates bought or taken in exchange for new Silver Plated Plates, and full value allowed. Gold extracted from old Plates at a moderate cost by a new and economical process. Old Plates (which often contain a surplus of gold above the cost of plating) can be re-plated.

With the most extensive facilities on the Pacific Coast, orders can be filled very promptly and satisfaction guaranteed.

Mining Men and the public generally are cautioned against unprincipled and irresponsible parties traveling through the country, endeavoring to secure ordere for very inferior qualities of Silver Plated Mining Plates.

SAN FRANCISCO GOLD, SILVER, NICKEL AND COPPER PLATING WORKS,

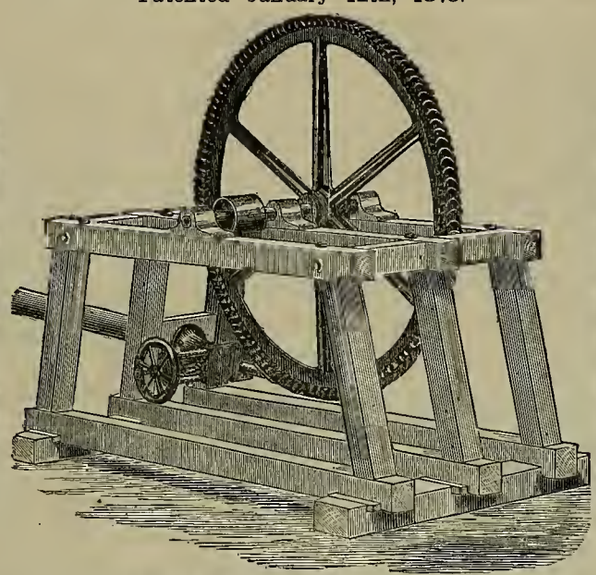
Nos. 653 and 655 Mission Street, San Francisco, Cal.

EDWARD G. DENNISTON, - - - - - - - - - PROPRIETOR.

Knight's Water Wheel,

Patented January 12th, 1875.

This Wheel possesses more power for a given percentage of Water than any yet offered to the public. They are in practical use in many Mills and Hoisting Works, and never fail to give entire satisfaction, which facts speak fully for their efficiency, and render further comment unnecessary.



This Wheel possesses more power for a given percentage of Water than any yet offered to the public. They are in practical use in many Mills and Hoisting Works, and never fail to give entire satisfaction, which facts speak fully for their efficiency, and render further comment unnecessary.

The KNIGHT WHEEL is used in the following named Mills and Hoisting Works, to which the Public are referred:

1–Eight-foot wheel, running Oneida Co.'s Mill, Amador county, Cal.; 60 stamps. Roh't Robinson, Supt.
1–Eight-foot wheel, running Con. Amador Mining Co.'s Mill, Amador county, Cal.; 40 stamps and two Hepburn pans. David Davis, Supt.
1–Eight-foot wheel, running Lincoln Oold Mining Co.'s Mill, Amador County, Cal.; 40 stamps.
1–Eight-foot wheel running pump at same company's mine. S. D. R. Stewart, Supt.
1–Eight-foot wheel, running Keystone Con. Mining Co.'s Mill, Amador county, Cal.; 40 stamps.
2–Four and one-half foot wheels, used in hoisting by reversible water power at same company's mins. O. C. Hewitt, Supt.
1–Four and one-half foot wheel, running Original Co.'s Mill, Amador County, Cal.; 40 stamps, one pan, one rock-breaker. J. R. Johns, Supt.
1–Four-foot wheel, running Gover Mining Co.'s new mill, Amador county, Cal.; 20 stamps.
1–Eight-foot wheel, running same company's old mill; 10 stamps. John Palmer, Supt.
1–Six-foot wheel, running Talisman Mining Co.'s Mill, Amador county, Cal.; 10 stamps.
1–Eight-foot wheel, hoisting and driving pump at same company's mine. John Tregloan, Supt.
1–Four and one-half foot wheel, running Bunker Hill Mining Co.'s Mill, Amador county, Cal.; 10 stamps. John Palmer, Supt.
1–Six-foot wheel, running St. Patrick's Mill, Nawcastle, Placer county, Cal.; 15 stamps. Jno. Towussnd, Supt.
1–Eight foot wheel, hoisting and running pump, compressor and hoisting at Sheba Silver Mining Co.'s mine, Stats of Nevada.
1–Four and one-half foot wheel, running Luck Q. M. Co.'s Mill; 10 stamps; Oregon.
1–Four and one-half foot wheel, running Republic Mill, Nevada county, Cal.; 20 stamps. E. H. Dyer, Supt.
1–Six-foot water wheel running at the Plumas Eureka Mill, Cal., 48 stamps, 2 pans, 9 ore-breakers and 22 concentrators.
1–Eight-foot water wheel running 40 stamps for the same Company. Wm. Johns, Sup't.
4–Six-foot water wheels running the Sierra Buttes Mills, Sierra Co., Cal. Wm. Johns, Sup't.
2–Six-foot and 2 four and one-half-foot wheels running Soulsby G. M. Co.'s Mills, hoisting and pumping works, Sonora, Tuolumne County, Cal. J. Leechman, Sup't.
1–Six-foot water wheel running Providence 20-stamp mill, Nevada City, Cal.
1–Four and one-half-foot wheel running DeFrees Mill, Tuscarora District, Nevada.
1–Six-foot water wheel running 20 stamps at Julian mine, Newcastle, Placer Co., Cal. A. H. Schnabel, Prop'r.
1–Six-foot water wheel running Mammoth Mill, 30 stamps and 14 pans and ore-breakers, Mammoth Lake District, Mono Co., Cal. Clark, Sup't.

CAUTION

To Hydraulic Miners.

Ths public generally and Hydraulic Miners especially are hereby notified that any parties making or using the contrivauce known as the HOSKIN DEFLECTOR will be prosecuted to the full extent of the law, said machine having been declared by the U. S. Circuit Court an infringement upon my patent, the

Bloomfield Deflecting Nozzle.

The public are also cautioned against using the Hoskin Deflector because of its danger to life and limb, this device having already occasioned several deaths and other serious accidents. The BLOOMFIELD DEFLECTOR is entirely safe, its two and a half years use without accident, as well as its construction, proves it to be a reliable contrivance.

Any parties wishing to purchase the right to use these Deflectors can do so by applying to the undersigned,

HENRY C. PERKINS,

North Bloomfield, Nevada Co., Cal., October 1st, 1878.

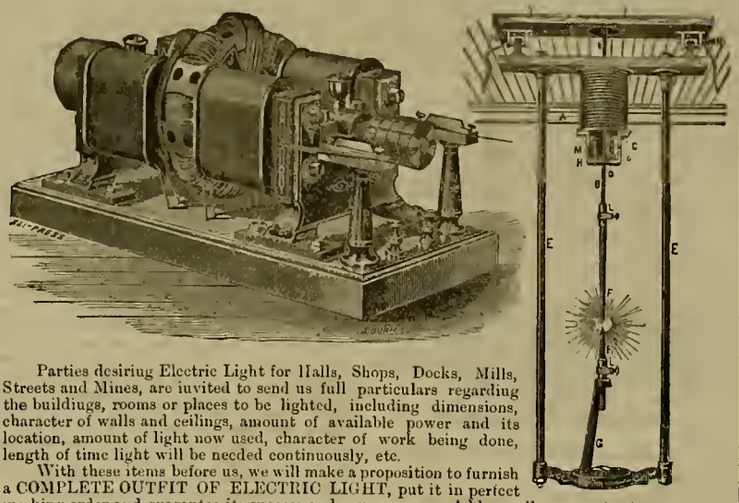
ELECTRIC LIGHT.

BRUSH PATENT.

The Best, Cheapest, Cleanest, and Most Powerful Light in the World.

In daily use at the Palace Hotel and the Union Iron Works, S. F.



Parties desiring Electric Light for Halls, Shops, Docks, Mills, Streets and Mines, are invited to send us full particulars regarding the buildings, rooms or places to be lighted, including dimensions, character of walls and ceilings, amount of available power and its location, amount of light now used, character of work being done, length of time light will be needed continuously, etc.
With these items before us, we will make a proposition to furnish a COMPLETE OUTFIT OF ELECTRIC LIGHT, put it in perfect working order and guarantee its success and permanence. Address all communications,

WM. KERR, President,
San Francisco, Cal.

Ingersoll Rock Drills.

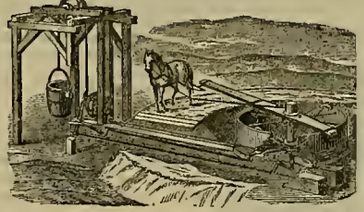
In use in the largest and best Mines of the Coast.

HAS AUTOMATIC FEED.

Has less Repairs.

Is Lighter and more Easily Adjusted than any other Drill.

Our DRY AIR COMPRESSORS are the most Economical Compressors in the Market.



MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.
The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

[Continued from page 229.]

per ton. The Daily tunnel, which is about 75 ft above the last named, in perpendicular hight, is 150 ft in length. Commencing at a point 125 ft from the mouth of the adit, J. M. Daily & Co. have leased 100 ft of ground running in a westerly direction. Twenty-five ft of this have been opened by the continuation of the adit, and thus far the explorations have resulted highly satisfactory, showing up from two to eight inches of ore on the south wall, and a smaller and less continuous streak on the north wall. The mineral consists in part of solid galena with copper pyrites and some gray copper, the remainder being decomposed, and carrying malachite and sulphurets of silver. The ore on the north wall runs 188 ounces, and that on the south wall carries 482 ounces of silver per ton without classifying. Thirty-five ft back from the breast of the drift is a cross-lode thought to be the Joe Reyno'ds No. 1. This has been opened a few feet, and carries some rich ore, but not sufficient to warrant its exploration while there is better ore in sight in the main drift. Kramer, Wilson, Stevens & Davis, who have raised up from the O'Connel tunnel, are now stoping within 15 ft of the Daily tunnel on an uncommonly fine body of ore. For a distance of 50 ft there is a continuous vein of solid mineral from three inches to a foot in width. The bulk of the ore is bright fine-grained galena, carrying copper pyrites and gray copper. Since this pocket was encountered no runs have been made, but it will not mill less than 400 ounces per ton. The Discovery tunnel is being run in under contract, and at present shows but an unimportant quantity of low-grade mineral in the breast, which is 200 ft in. This ground is leased by Kennedy & Daily.

IDAHO.

Salmon River.—*World*, April 4: The mines on Killikinick creek are producing some rich ore, which will be shipped to market as soon as the snow melts sufficiently to permit it. The Hood and Beardsly mines, in Bay Horse district, are also producing a large amount of ore of a medium grade, and the famous Ram's Horn mine, in the same vicinity, keeps up its reputation as a rich ore-producer. They are down 50 ft on the Vermont mine and from developments already made, this property proves to be a veritable bonanza. Part of the ore will average from $70 to $80 in silver and gold; and to 18 inches to two ft of the vein will assay from $350 to $900 per ton in gold and silver.

Other Notes.—Danskin & Co.'s placer claims, on Granite creek, have been put in good shape, and are probably piping by this time. The Belshazzer company are at work running a tunnel to connect with their shaft. They have about 60 ft to run yet, but in case water does not trouble them, will make the connection in a month or six weeks. Good rock has been taken out of the Ebenezer mine during the winter. The Granite Creek Ditch company have water through their lower ditch and to Placerville in the upper one. Their claims at Placerville and Granite creek are all running. Several other claims in that vicinity are also running.

MONTANA.

Jottings.—Helena *Independent*, Mar. 27: At the Centennial mill, the proprietor, Mr. John C. Rainsford, has just increased the amalgamating capacity of the works by the addition of another large Newell pan to the two previously at work in the pan room. Next week the Centennial battery will be increased to double its present number of stamps by the erection of five more, for which the mortar is already in place. The Centennial is at present employed on ore from Mr. Boardman's claim on the Original lode. At the Boardman claim, on the Original, the main shaft was furnished with a cage, an improvement which greatly facilitates the hoisting of the 20 tons of ore taken out every day. The shaft is 186 ft deep. At that depth a level is run to the vein, which is found to be base and of rather low grade, as was the case with the Alice ore at that distance below water level. At 100 ft from the surface, the first adit crosses the ledge, where it is found to be 22 ft wide. At this point it carries free-milling ore, of which the first class ranges up to 150 ounces per ton. This claim is provided with steam hoisting works, a wire cable, ore cars, and everything else needed for its speedy and economical working.

OREGON.

Mining Items.—*Sentinel*, April 2: The Coyote Gravel company are working night and day with a full force, and the ground indicating big pay. Every claim on Jackass is being worked with plenty of water, and the yield of gold in that district is good. The Squaw Lake company are still cleaning and repairing ditch, but will soon be at work, and will have a full head all summer. The Grand Applegate company is still busy at work on their ditch and expect to be ready for washing in a month. At Palmer creek the boys are piping night and day with two shifts. They only expected to test their mine, but will now have a paying run. John Meldrum is making $10 per day ground sluicing at Steamboat. There are about 30 men at work in that district, including Chinese. Tom Kahler, Fort Lane, cleaned up last week, his claim paying $10 per day to the hand. The late heavy storm will give him a new start. Star Gulch mine running night and day with a full head of water. From appearances in the ground sluice this company will make a good clean-up. Bybee, Hawkett & Co. are crowding the gravel with two pipes, and the former has gone down the river to enjoy the yellow appearance of the sluices. The English company and the Blue Gravel company, on Galice creek, are both running with a full force and water enough for double the number of pipes.

UTAH.

Bingham Items.—Salt Lake *Tribune*, April 6: A jigger has been put in operation on the Winnamuck slag dump. Sufficient water could not be had to run a wheel, and the next best thing had to be resorted to. Mr. Mullett conceived the idea that the cayuse might be utilized. A horizontal wheel, 10 ft in diameter, with an attachment similar to that of a whim, has been erected. The revolving of this wheel by the use of a horse, furnishes the motive power to run the jigger. Work so far by this process gives entire satisfaction. The boys of the Caledonia mine have recently struck a fine body of high-grade ore in the upper tunnel. The Argonaut company have started work on their placer ground, and, although very little snow fell during the past winter, sufficient water is to be had for hydraulic purposes.

Silver Reef.—On the Buckeye Reef operations continue active. Litigation, with its attendant evils, retards work on several of the best mines, but in the Buckeye, Last Chance, Stormont and others, development is progressing without interruption. The Buckeye is working a full complement of men, and supplies the mill with more ore than it can separate, necessitating the addition of more stamps and pans. Messrs Branham, Potter, and Day, owner, manager, and Superintendent, respectively, are fully alive to the requirements, and before long extensive additions to the milling facilities may be expected. The Last Chance is working 50 miners, and under the management of live and practical men, is returning handsome dividends. Vigorous working on the Stormont has been resumed, and many chloriders are engaged in delving for the precious metal. The Barbee mine is developing finely; the ore body seems to be permanent and richer than ever, and is mined in such quantities as to tax the capacity of the mine to the utmost.

The work on the *Jeannette* is proceeding slowly at Mare Island, as a general survey is to be held on her when she goes on dock.

An unsuccessful attempt was lately made at San Rafael to release from jail the convicted murderer, William Dever.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[From Official Reports for the Mining and Scientific Press, DEWEY & CO., Publishers and U. S. and Foreign Patent Agents.]

By Special Dispatch from Washington. D. C.

For the Week Ending March 18th, 1879.

213,368.—Neck Yoke—L. E. Ainsworth, Vermilion, Dakota Territory.

213,373 —Ore Feeder—D. H. Anderson, S. F.

213 309.—Pump - W. T. Wilcox, S. F.

213,399.—Bit Stock—L. C. Di Bert, S. F.

213,386.—Vehicle Spring—O. S. Carville, S. F.

213 382.—Apparatus for Obtaining Metallic Copper from its Solutions—C. C. Bitner, Spenceville, Cal.

213,400,—Wagon Brake—J. F. Ditsworth, Austin, Nev.

7,120 to 7,124 inclusive.—Candles—Trademark — W. T. Coleman, S. F.

7,125 —Clothing—Trademark—Heynemann & Co., S. F.

7,112.—Candles—Trademark—Castle Bros., S. F.

7,114.—Cathartic Medicine—Trademark—E. DePrati, San Francisco.

7,109.—Canned Salmon—Trademark—J. W. & V. Cook, Clifton, Ogn.

——The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

Note.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s Scientific Press American and Foreign Patent Agency, the following are worthy of special mention:

Safety Lamp.—David Lubin, Sacramento. Dated, Mar. 11th. This consists in a novel construction of an elongated reservoir for oil or burning fluid of any kind, said reservoir being tubular in form and coiled in a spiral of one or more coils in any desirable manner, whereby a sufficient quantity of oil may be held in a compact but at the same time separate and extended form. This spiral may be made in a plane or may be in the form of a flat cone, or in any way to allow the oil to flow from the center to the outside. The feed cup and wick cup are provided with interchangeable wire gauze safety protectors to prevent the ingress of foreign matters, and insure safety from explosion. The exterior of the reservoir connects by an S or V curve with the wick portion or chamber, which is situated outside the spiral so that the light will not be shaded by a large reservoir. The whole is mounted upon a suitable stand, and from the shape of the reservoir it will not be possible to spill any large quantity of the oil by upsetting. Being formed of gas pipe or other strong tubing it cannot explode. An oil reservoir at the bottom of the curve serves to retain any overflow or drops. The whole lamp, reservoir and all, may be made in a single piece, and in several different forms. This lamp is specially useful in factories, machine shops, mines and such places where explosion or fire would do much damage. The lamp is strong and durable and not easily injured. Its construction is such as to prevent explosion.

Lock. — Nestor A. Young, Healdsburg. Dated, Feb. 25th. This is an improvement in construction on keyless locks, and is especially adapted for use in padlocks. This invention is an improvement on a patent granted to W. R. Young, November 27th, 1877, and consists in a novel construction of an outer case having an internal spindle or stem, which is formed on one piece with the outer case, and serves as a guide or center for all the tumblers, but the outer one and driver, from which they are independent. This latter is secured to the closing plate which also forms the dial disk, and the inner flange of this driver fits against and is steadied by the end of the stem upon which the tumblers turn. The closing plate is securely locked in place by means of a loose disk, which has lugs upon its edge so arranged as to be turned into corresponding slots on the inner edge of the case, and when in place it is locked, and prevented from removal by means of the bolt or staple when it is in place.

Axle and Axle Box.—Edgar E. Lincoln, San Jose. Dated March 11th. This invention relates to a novel construction and method of uniting axles and axle boxes so that the inventor is enabled to reduce the size of the journal to very small proportions. It is rendered perfectly dust-proof and easy to lubricate, and the space which the box occupies reduced within the hub so that the mortises for the spoke tenons may be extended to near the center, thereby greatly strengthening the important points, while the construction prevents any oil or lubricant from finding its way from the journal to the interior of the hub to loosen the spokes.

Car Brake.—Albert Waymouth, Livermore, Alameda Co. Dated, Mar. 11th. This invention relates to an improved mechanism which is designed to be applied to the cabooses or cars which make up the rear ends of heavy trains, and it is of special value on those roads having steep gradients when the rear end of the train sometimes become detached from the forward portion, in which case the rear cars run backwards down the grades, thus causing serious accidents. This invention is designed to remedy this defect, and consists in the attachment of an automatic brake apparatus, which shall act in one direction, while it allows the car to run freely in an opposite direction. A clutch is mounted on the axle of the car and is so connected with the brake bar as to act when the car attempts to run backwards, in throwing on the brakes, locking the wheels and stopping the car.

The Clover-Seed Fly, a new Insect Pest. At the annual meeting of the N. Y. State Agricultural Society, held at Albany, in January last, J. A. Lintner, of the State Museum of Natural History, read a paper in which—among other injurious insects recently observed—he gave an account of the larvæ of an insect which had been discovered two years ago in several localities in eastern and northern New York, hidden within the seed-pods of the red clover, (*Trifolium pratense*) and destroying the seeds. The perfect insect had not yet been seen, but the examination of the larva show it to belong to the *Cecidomyidæ*, and in all probability very nearly allied to the wheat-midge, *Cecidomyia destructor*. A description of the larva was given under the name of *Cecidomyia trifolii* n. sp. The range of this insect's depredations or the extent of its ravages was yet unknown. In some localities in the western counties of the State of New York, the clover was so infested with it last year that it was worthless for seed. It is believed that the not infrequent failure heretofore reported of the clover-seed crop throughout the country, which has been ascribed to imperfect fertilization of the blossoms and various other causes, has been the result of the secret operations of this little insect.

Wages are from $3.50 to $4 a day at the Snake River mines, but there is room for few to find employment.

A strike of laborers took place in San Francisco recently and for a time threatened serious trouble.

The mushroom season has commenced in the vicinity of Chico and a Chinaman was the first victim.

The first crop of flax on the island is now growing at Belle View, Tulare county.

The Western Union lines are to be extended from Bodie to Benton.

Quicksilver Mining.

Memoir on the Mines and Works of Almaden, by M. H. Kuss, M. E. Translated from the "Annales des Mines" for the Mining and Scientific Press, by S. B. Christy.

CONTENTS. — Part I.-Geological Description of the Deposits at Almaden: 1. Introduction; 2. Geological Situation and Constitution; Silurian System; Devonian System; Eruptive Rocks; 3. Deposits of Mercury; Description of the Mine; Mineralogical Constitution of the Vein Matter; Age of the Veins; Abandoned Mines Part II.—Exploitation of the Mines of Almaden: 1. Method of Exploitation; 2. Organization of Labor; 3. Mechanical Preparation. Part III.—Metallurgy of Mercury at Almaden: 1. Description of the Works; 2. Treatment of the Ore; 3. Losses of Treatment. Part IV. -Administration and History; 2. History; 48 large pamphlet pages, post-paid, 50 cents. DEWEY & CO., Publishers, S. F., 1879.

Submarine Nail-Driving Device.—The U. S. Naval authorities will soon give Wm. Stack's device for driving nails under water an official test at Mare Island. Mr. Stack is a resident of Oakland, and secured his patent through this office It is shown in the illustrated advertisement of this issue.

An Engineer, favorably known in the East, desirous of settling in California, seeks position as Superintendent or Chief Draughtsman. Competent to design stationary, marine, locomotive, mill work, sugar and hydraulic machinery. Speaks Spanish. Unexceptional references. Address Expert, this office.

Kustel's Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams, 1867. The most complete treatise. Published at this office. Price, $7.50. Postage, 50 cents extra.

Fresh attractions are constantly added to Woodward's Gardens, among which is Prof. Gruber's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

How to Stop this Paper.—It is not a herculean task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter*.

Examine the accelerative endowment plan, as originated by the Mutual Benefit Life Insurance Co., of Newark, New Jersey. Assets, $30,533,429.94. Lewis C. Grover, President; L. Spencer Goble, Vice-President; Benjamin C. Miller, Treasurer; Edward A. Strong, Secretary; Bloomfield J. Miller, Actuary. Send for circulars to James Munsell, Jr., agent of insured, 224 Sansome St., San Francisco.

M. D. Shrader is now an authorized agent of the Pacific Rural Press, also Mining and Scientific Press, to solicit subscriptions and receive the money for the same His receipts given for such money will be duly honored by this company.

Experimental Machinery, drawings, patterns, models, all kinds of electrical and telegraphic apparatus to order. See ad. F. W. Fuller, 415 Market St., second floor, S. F.

OUR AGENTS.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. L. THARP—San Francisco.
B. W. CROWELL—California.
A. C. KNOX—Pacific Coast.
J. W. A. WRIGHT.—Tulare, Fresno and Kern counties.
S. V. BLAKESLEE—Northern California.
H. E. HALLETT.—Stanislaus and Merced counties.
G. W. MCGREW.—Santa Clara county.
RICHARD ALLEN.—British Columbia.
JOHN MICHELS.—New York and adjoining cities.
M. D. SHRADER—Alameda County, Cal.
JOS. DIMMICK.—Sonoma and Napa countiss.
HENRY R. EWALDT.—Arizona Territory.
JOS. WASSON.—Mono County, Cal,
L. P. MCCARTY.—Amador, Calaveras and Tuolumne counties.
MILTON KENNEDY.—Tulare County.
R. E. BUSH.—Nevada County, Cal.
MILT. D. WILLIAMSON.—San Joaquin county.
J. W. HAMM.—San Joaquin county.

A Library for Inventors.

We have at our patent offices, No. 202 Sansome street corner Pine, a complete set of Patent Office reports, containing engravings and claims of EVERY PATENT ever issued in the United States.

We have also a complete set of the MONTHLY VOLUMES issued by the Department, with full detailed description and large drawings of all the patents issued since the time when these volumes were first published.

A set of all the LAW BOOKS ON PATENTS is also on our shelves ready for reference. We have also the British Commissioners reports, Canadian Patent Office reports for all British North America, full files of MINING AND SCIENTIFIC PRESS, PACIFIC RURAL PRESS, *Scientific American*, *Scientific American* supplement, *American Artisan* and other American and foreign scientific and mechanical journals, as well as mechanical dictionaries chemistries, encyclopedias, and other works of reference.

Inventors and patentees are WELCOME TO EXAMINE at their leisure any of the books in the above sets, and we shall be glad to give them any assistance in hunting up what they want.

Our library is the most complete of its kind on the Pacific Coast in every respect, and we are continually adding to it as occasion demands. DEWEY & CO.,
Patent Agents and Publishers,
No. 202 Sansome street, corner Pine, San Francisco

REGISTER YOUR TRADE

MARKS.

The U. S. Government now offers greater protection than formerly to manufacturers under the law of Trade Marks.

Those who manufacture a superior article, or put up improved packages of merchandise, should protect themselves from imitations by registering their Trade Marks.

We have special facilities for securing full rights by the registration of Trade Marks, and our terms are very reasonable.

Consultations free. Many dealers have missed fortunes from not being fully informed and protecting themselves in their rights.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Mount Jefferson Milling and Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Garrote Mining District, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Directors held on the 21st day of March, 1879, an assessment (No. 6) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, Room 6, No. 318 Pine street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 2d day of May, 1879, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Tuesday, the 27th day of May, 1879, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

R. N. VAN BRUNT, Secretary.
Office, Room 6, No. 318 Pine Street, San Francisco, Cal.

California and Oregon Land Company.—Location of principal place of business, San Francisco, California. Location of Works, State of Oregon.

NOTICE.—There is delinquent upon the following described stock, on account of assessment (No. 2) levied on the first day of March, A. D., 1870, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Allen, J O	130	400	$100 00
Pond, E B	120	50	20 00
Parks Bros., Trustees	133	250	100 00
Parks Bros., Trustees	134	250	100 00
Parks Bros., Trustees	135	250	100 00
Parks Bros., Trustees	136	250	100 00
Woodrum, O P	100	100	40 00
Woodrum, O P	107	100	40 00
Woodrum, O P	108	100	40 00
Woodrum, O P	109	100	40 00

And in accordance with law, and an order of the Board of Directors, made on the first day of March, 1870, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the Company, on Saturday, the tenth day of May, A. D., 1879, at the hour of two o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

R. N. VAN BRUNT, Secretary.
Office, Room 6, No. 318 Pine street, San Francisco.

Summit Mining Company.—Location of Principal place of business, San Francisco, California. Location of works, Mineral Point Mining District, Plumas County, Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 7,) levied on the 4th day of February, A. D., 1870, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Byers, W T	38	700	35 00
Edwards, J E	39	700	35 00
Gautier, Gustave	156	200	10 00
Kellogg, H W	46	1000	50 00
Lehmann, C, Trustee	206	200	10 00
Lehmann, C, Trustee	207	200	10 00
Turner, J W	65	200	10 00
Thompson, R	24	1200	60 00

And in accordance with law, and an order of the Board of Directors, made on the Fourth day of February, A. D., 1870, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, No. 318 Pine street, Room 6, San Francisco, California, on Tuesday, the Eighth day of April, A. D., 1870, at the hour of three o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

R. N. VAN BRUNT, Sec'y.
Office, Room 6, No. 318 Pine Street, San Francisco, Cal.

POSTPONEMENT.—The sale of delinquent stock of the above named Company is hereby postponed until Tuesday, the Sixth day of May, 1879, at the same hour and place. By order of the Board of Directors.

R. N. VAN BRUNT, Secretary.
Office, Room 6, No. 318 Pine street, San Francisco.

Union Stone Company.—The Regular Annual meeting of the Union Stone Company of California for an election of a Board of Directors (to act as Trustees) to serve the Company for the ensuing year, and for such other business as may properly come before the meeting, will be held at the office of the Secretary of the Company at 237 First Street, San Francisco, California, on Tuesday, April 8th, 1870, at 11 o'clock A M.

R. F. KNOX, Secretary.
San Francisco, March 20th, 1870.

Mill and Mining Machinery Of All Kinds For Sale by BERRY & PLACE

At the Old Stand, Market, head of Front Street, S. F.

SUGAR FROM MELONS.

Indigenous sugars and directions for making sugar from melons. A most complete and practical treatise on making sugar from both beets and melons, giving full information as regards the best soil; the quality of products; their culture; how to gather them; how to obtain the juice; making the sugar; crystallization; grape sugar; sugar from sorghum, etc., embracing upwards of 55 pages, bound in neat pamphlet form. Compiled and original by W. Wadsworth. Owing to a surplus on hand, the publishers of the above book have reduced the price to 10 Cts., postage paid. Address DEWEY & CO., 202 Sansome St., San Francisco.

The Large Circulation of the MINING AND SCIENTIFIC PRESS extends throughout the mining districts of California, Nevada, Utah, Colorado, Arizona, Idaho, Montana, British Columbia, and to other parts of North and South America. Established in 1860, it has long been the leading Mining Journal of the continent, its varied and reliable contents giving it a character popular with both its reading and advertising patrons.

DEWEY & CO.

American & Foreign Patent Agents,

OFFICE, 202 SANSOME ST., N. E. COR. PINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemburg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

San Francisco, Cal.

CARTRIDGE.

GEN. W. S. ROSECRANS,
President.

Fuse Lighter and Fuse.

COL. SAM'L O. GREGORY,
Secretary.

Safety Cap and Fuse.

Electric Cap.

Safety Powder, Caps, Electric Caps, and Fuse Lighters.

Under a series of U. S. Patents, after long and carefully conducted experiments and thousands of tests, this Company is prepared to manufacture and supply, for Mining and Engineering Works, the above named articles at prices and on terms as favorable as articles of similar grades are now supplied in this market. Our Powders contain no Nitro-glycerine, no Nitroline, no Gun Cotton, no Fulminates, and are free from the unavoidable dangers in manufacturing transporting, handling and using of all high grade explosives which contain those elements.

Cold does not affect them. They cause no headaches or other inconveniences in handling, and the smoke from their explosion contains no poisoning or sickening vapors.

Their blasting force, with slight tamping, at least equals that of any Powders now used, but they admit and require strong tamping to bring out their immense and peculiar lifting power which follows their detonating work. They should be fired, therefore, by our

Safety Cap,

Which allows tamping without danger. They can be fired by any caps now employed in blasting, but the use of these is always dangerous with any Powder, and the loss of the throwing power resulting from lack of tamping renders it with our Powders doubly objectionable.

Our SAFETY CAPS have twice or thrice the force of triple Giant Caps. When set on fire they do not explode, but merely burn off, and are perfectly safe in transporting and in tamping.

In round tin boxes, 50 cents.

The Safety Fuse Lighter,

Cheap, handy and sure to light the Fuse upon the end of which it is fastened, only needs a trial to be appreciated by every miner who is up to "snuffs." 25 Cents per box; sent by mail.

Safety Fuse,

Equal to the best in the market, will be supplied at the lowest market prices.

In consequence of spurious imitations of

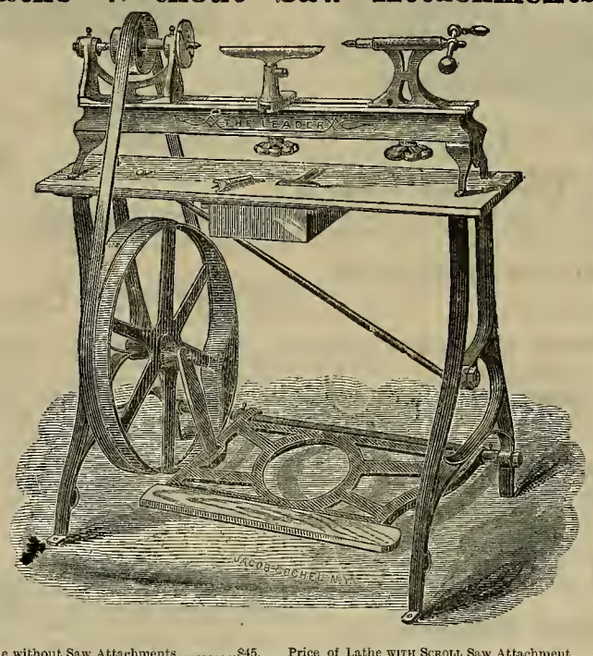
Lathe Without Saw Attachments.

This Lathe has been made especially to meet a want felt by many for a really good and substantially made Foot-Lathe at a reasonable price, and we think that we can safely say that it is by far the best Lathe ever placed on the market at the price asked. The bed, head, and tail stocks are of iron; the spindles of steel. The bearings of the head stock is conical, so that the wear can be easily taken up.



Material eighteen inches long and eight inches in diameter can be turned on it. The pieces that accompany this Lathe without extra charge are two T rests, two plain centers, one spur center for wood turning, and one face-plate.

Price of Lathe without Saw Attachments.....$45. Price of Lathe WITH SCROLL Saw Attachment.....$55.
Price of Latbe with both Scroll and Circular Saws, $70.

Trump Drill Chuck.

Important to Contractors

—AND—

SUBMARINE BUILDERS.

WILLIAM STACK, of Oakland, has recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency, an apparatus for driving nails or spikes under water, an engraving of which is here shown. It is well-known that it is extremely difficult to drive nails or spikes under water, even if it is only submerged a few inches. These difficulties are completely obviated by Mr. Stack's device, which has been put in thorough practical operation in the construction of wharves and slips in the Oakland side of the bay.

Fig. 1 shows the application of the device, and Fig. 2 shows the construction. *A* is a metal tube of suitable length, the foot of which may be serrated as shown, so that the points will engage with the wood when the tube is pushed or driven against it. The rod or driver, *C*, has a recess or cavity, *D*, at the lower end so as to rest on top of the nail or spike shown in Fig. 2. Where the tube, *A*, is pushed against the timber in the desired position, the spike or nail is dropped in at the upper end and slides down against the timber. The rod, *C*, is then slid down on top of the nail, and by alternately drawing out and forcing the rod into the tube, the rod serves as a driver; or by hammering on the upper end of the rod the nail is driven into the wood. The tube answers both as a guide for the nail and driving rod. The tube can also answer as a guide for a screw-driving device on the end of the rod, by which lag screws may be put in place under water as well as nails. Of course the tube may be set in any position desired, so that nails may be driven at an angle if necessary. The appliance, as simple as it is, will be found very useful in many cases for bridge building or similar purposes. Address

SAN FRANCISCO, SATURDAY, APRIL 19, 1879.

VOLUME XXXVIII Number 16.

The First Ominous Note from Snake River.

Already there is over-crowding, idleness and suffering on Snake river. The consequences that usually attend the *stampede* have not failed, it seems, to wait on this, the most recent of its kind. The forebodings of ill have begun to be realized even earlier than was expected. That destitution and disappointment would come to these adventurers in due time was of course forcseen; hut it was hardly thought that they would come so soon. Satisfied, from the glowing accounts of these mines that filled the papers off that way, that a prematnre and ill-advised movement of this sort would be likely to ensue, we took occasion several months since to cantion the mining community against this danger. But when were miners ever known to pay due heed to admonitions of this kind? Neither experience nor warniug avails to restrain them from rushing away to the most distant locality once the rumor of a new find, especially if it be placer diggings, reaches their ears. We had suspected from the late less confident tone of the Idaho and Salt Lake papers, when speaking of Snake river, that the emigrants to that region were hardly meeting with the success that they had heen encouraged to look for; and now from very authentic sources of information we are sorry to hear tbat such has really been the casc.

To the courtesy of Col. Isaac M. Taylor, who hae just returned from a visit to the Salmon River country, where he went to examine certain mines for San Francisco capitalists, we are indebted for some fresh and reliable news from the Upper Snake. The bars along that portion of the river contain, as we stated in an article on the subject last week, less gold than those further down. The country there is also higher and colder, in consequence of which the miners have been prevented from getting to work as soon as they expected. Very little gold has therefore been taken out, hut few claims being worked and these paying less than was anticipated. Instead of yielding from $10 to $15 per day to the hand, tbey have not, as yet, yielded half these rates. Meantime, claim holders are without the means for outfitting their claims, or are prevented from doing so by the cold and stormy weather, while hundreds of men swarm along the river, scarcely any of them able to get employment, the most of them being without snfficient money to get away, very many without even enough to huy a meal of victuals. In this dilemma some had already started on their return, walking out of the country, the railroad heing nnwilling to carry any without payment of full fare. Wages at the mines are nominally $1.50 pcr day, though enough men can he had to work for a dollar, and even for their board.

This region of country is settled by the Mormons, and consequently low prices prevail; these people, who huilt the narrow-gauge railroad from Ogden to Snake river, having worked for 75 cents per day. On the river all claims worth taking up are located, leaving newcomers no chance to get ground without huying it. It costs a good deal to outfit a claim, as either a ditch has to be dug for some distance, or a current wheel put in for getting water upon it. Even where recourse is had to the latter expedient the expense is considerable, lumber costing not much less than $100 per M. by the time it is got on the ground. The merchants at Blackfoot, present terminus of the railroad, informed Col. Taylor that they regarded the whole business as hardly better than a humbug, expressing the opinion that the diggings in that vicinity would not pay on an average more than two or three dollars per day to the man. Further down the river they will no doubt prove more remunerative, but even there everything is taken up, leaving no chance for men who go in now to get a claim by location, while the opportunities for obtaining work are probably no better than they are up about Blackfoot and at points further up. In view of the foregoing statements, a man's industrial condition must be desperate indeed if he could hope to improve the same by emigrating to Snake river.

Our Deep Mines.

Tho exploratione on some of the mines in this country are fast approaching the greatest depths reached in the long-worked mines of the old world. For example, the Belcher shaft, on the Comstock, has now reached a perpendicular depth of 2,680 feet below the surface, being within 600 feet of the depth at which the Adelbert, lead-silver mine in Austria, is now being worked, and which is accounted the deepest mine in the world. It should be stated that in estimating the depths of the various shafts sunk on the Comstock, it is the custom to make the measurements from the top of the Gould & Curry croppings, the so-called *datum* line for all vertical measurements made along the lode. Starting from this level the Belcher shaft would bave a depth of 3,093 feet. Among the Comstock mines the Yellow Jacket shaft is now 2,500 feet deep, the other mines there, as regards depth, standing in the following order: Con. Imperial, 2,367; Savage, 2,350; Con. Virginia and California, 2,326; Chollar, 2,421. At the bottoms of most of these shafts are inclines rnn at various angles and to greater or less depths, the Yellow Jackct's new shaft being the deepest perpendicular opening on the Comstock, its bottom heing now nearly 2,400 feet below the surface. There are not in all Europe perhaps a dozen deeper mines than these on the Comstock, only one or two being found in England. Besides those above enumerated, there are several mines on the Comstock that have been opened to depths varying from 1,500 to 2,200 feet. As the deep workings on this lode are nearly all being driven actively downward, we will soon be able to point to a numher of deeper mines in this country thau exist anywhere else in the world. As the extreme deep mines of Europe are being worked for coal or ores of low grades, it is not prohable that they will be opened to much greater depths than have already been reached; whereas, the leading Comstock companies will push explorations to twice their present depths, extracting ore, should they find it, and continuing the search to the lowest levels it is possible to reach, should they fail to do so.

FIG. 1.

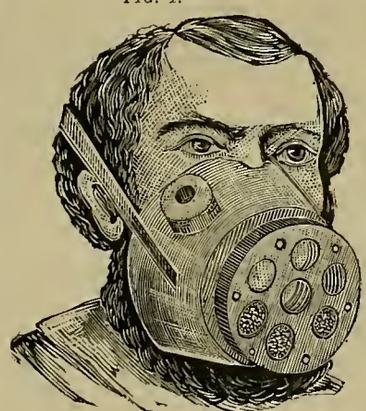

FIG. 2.

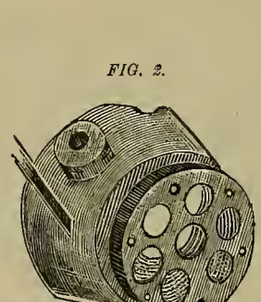

RESPIRATOR FOR USE AT REDUCTION WORKS.

An Appreciative Official.—Andrew J. Hatch, Surveyor-General of Nevada, offers a premium of $100 for the most complete report sent to his office hy any County Assessor of that State. Mr. Hatch is an old resident of Nevada, and being himself well-acquainted with its wants, resources and capacities, thoroughly appreciates the value of full and correct statistics in regard to the same.

A new Protestant sect, distinguished like the Shakers hy their physical extravagances, has appeared in Westphalia, the proselytes being chiefly women.

Salmon River.

There is at a great elevation in southeastern Idaho, a mining district that goes hy the general name of the Salmon River country. Concerning its mineral resources a good deal has appeared during the past year in the papers of that Territory, and of Utah, adjoining; the accounts given of it being of a very favorahle description. From the statements of an experienced miner who lately visited that country in the interest of partics in this city, we are inclined to think its advantages as a mining district have been much overrated.

There are mauy ore-bearing veins in that region, both gold and silver, some of which prospect fairly; a few remarkably well. There is also wood and water in good supply, the mountains in some places being quite heavily timbered. But the winters are long and rigorous, the streams freezing up and the snow falling to such depths that the trails (there are no wagon roads) are oompletely blockaded for six months in the year. At the present time it is impossible to get within 25 or 30 miles of the mines with animals; the most of the distance has to be made on snowshoes.

There are no quartz mills or other reduction works in the country. There are, in fact, no improvements of any kind except the few cabins erected to shelter the small population that have wintered there. While there has been but little work done on the ledges, a considerable quantity of fair-grade ore has been taken out, the most of which lies on the dumps at the mines. During the past year some ore has heen shipped to Salt Lake where it was sold for a good price, or worked, turning out well. But this was, of course, carefully selected, as only rich ore would pay the cost of transportation, a good part of which had to be done with pack animals. To build even a tolerable wagon road into the district will cost at least $50,000, and until such road is built it will he next to impossible to get in any heavy machinery. For 40 or 50 miles the country is exceedingly rough, heing rocky and cut up with deep ravines. While there are many large and good looking ledges in this Salmon River district, our informant is of the opinion that it offers no special inducements to mining inveetors just at present.

A Good Record.—The Eureka Con. mining company, of Nevada, have declared a dividend of $1 per share, aggregating $50,000, payable on the 21st. This makes the 42nd dividend declared. Since the resumption of dividends in September, 1877, not a month has passed without a dividend. Up to and including December, 1878, these dividends were at the rate of $3 per share. Since then they have been $2 per share, and now they are reduced to $1 per share, which was the rate paid in the early history of the mine.

New Hydraulic Launch.

There has jnst beeu completed at the shops of Messrs. Thomson & Evans, 112 Beale street, in this city, the complete machinery for a steam launch to be propelled by hydraulio power, whicb has been invented and patented hy Dr. B. B. Brewer, of Sacramento. We understand that the inventor has, after a long series of experiments and a great expense, succeeded in producing a very simple and what promises to be efficient machinery for thie system of propelling. He claims to have entirely overcome the difficulties heretofore experienced by inventors who have experimented in the same direction. He claims that the machinery is equally practical for a fishing boat or a 3,000-ton ship. The vessel has neither wheel, screw nor rudder, and the machinery can be used in a sailing ship without any impediment to her sailing qualities, being useful in calm weather or in severe storms, as a vessel can keep on her course; or in case of a typhoon, the vessel can be kept head into the wind, as she is capahle of turning on her center without making headway, and the pilot has control, with power to reverse her course without stopping the engine, etc. In a point of economy it is claimed that there is a saving of from 25% to 50% over the wheel or screw.

We are restricted from giving a description of the mechanical construction of this peculiar machinery at this time, as the inventor has some points to look after before giving his experience to the world. But we are assured that the little vessel (which is 28 feet long and 6 feet heam) will be launched for her second trial in ahout two weeks, and after certain experiments are completed, the public will he given an opportunity to witness her manœuvers and speed.

An Improved Respirator.

We show on this page an engraving of the patent life-saving respirator for use at reduction works and similar places. Fig. 2 shows the device and Fig. 1 the method of application. In respiring the air is inhaled through a wet sponge or cotton, and in expiring passes out through a valve at the side, so that breathing with the respirator is easy, allowing it to be worn constantly and without any inconvenience.

It is worn over the mouth, nose and chin (as shown), for protecting the throat and lungs from dust, obnoxious smells or poieonous vapors. It is specially adapted for workmen engaged in white lead corroding, lead smelting, chemical works, lead mines, amalgamating and rotorting, dry crushing quartz mills, bullion refineries and quicksilver mines. It is claimed to be a sure preventive of lead poisoning and a guarantee against salivation.

These appliances are in use at Whittier, Fuller & Co.'s white lead works; Melrose smelting works; New Almaden quicksilver mine; Ontario silver mining company, Salt Lake; and at a 40-stamp dry crushing mill with Stetefeldt's furnaces attached. Mr. E. Burnham, Superintendent of the Pioneer white lead works, eays they give perfect eatisfaction, and he considers them a perfect preventive against poisoning through hreathing or inhaling air charged with mercury, lead dust or poisonous vapors or gases. A large numher of firms throughout the East have these respirators in use. They are sold for $3 each, or $30 per dozen, by Seth Marshall, Jr., 309 California street, room 9.

Correcting the Figures.—Certain of our contemporaries in the more distant mining regions are indulging just now in rather hig figures—talking of mineral wortb many dollars per pound, of ore reserves carrying millions in sight, and hullion production that will insure untold profits for all time to come. We like this, hut suggest that the reader remove the decimal points one or two figures towards the left.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

Lake District.—The Mammoth Mill and Mine.

Editors Press :—Since the first discovery of mines in this remote section of country, very little information has been imparted to the outside world regarding the true and important value of the silver and gold-bearing belt, which can be readily traced from Markleville, Alpine county, to this point, a distance of more than a hundred miles.

The bold outcrop on the famous ledge called the Mammoth, at once convinces the keen eye of the practical miner that the mother vein of the country is here. The formation is porphyry; the walls are well defined, with no horses to impede the constant ore extraction, and it is to be hoped that handsome dividends will soon be realized by shareholders in this company.

This camp was opened up last summer, and a 20-stamp mill built which commenced crushing ore on or about November 15th, with some stoppages afterwards, owing to the inclemencies of a rough winter. The mill has not in fact been run very steadily since it first started, but we anticipate big results hereafter, there being plenty of quartz to keep 40 stamps constantly employed.

The ore from the croppings of this lode assays, on an average, $30 per ton. The cost of reduction and extraction is probably $5, leaving a net yield of $25 per ton. The facilities for cheap reduction are probably better here than in any other camp on the Pacific coast, wood and water being abundant. The entire body of ore is free milling. Several other companies have purchased mining properties here, but are lying dormant, waiting to see whether or not the results of the Mammoth company's workings will warrant the expending money on their claims.

This camp is situated near the summit of the Sierra Nevada, and about 50 miles in a southerly direction from the town of Bodie. Being at such a great altitude the snow is deep and the weather severe in winter. During the rest of the year the climate is pleasant and always healthful. Near our town, which is on the easterly slope just over the main summit of the mountains, are not less than eight small lakes in which Owens river has its head. We are not over five to six miles from the upper tributaries of the San Joaquin. The country here is heavily timbered with pine, tamarack, fir, etc. The mill is driven by water, enough of which could here be easily commanded to drive 1,000 stamps if required; and in view of the great amount of ore the mine will yield, the present number of stamps will soon be largely increased. The ore already uncovered is estimated at 50,000 or 60,000 tons. A tunnel is being run which will intersect the main vein at a depth of 1,000 feet, affording drainage and an easy means for ore extraction to that depth. The ore is conveyed from the mine to the mill by chute and tramway. Very soon heavy bullion shipments may be expected from this mine.

Ditching by Machinery.

Editors Press:—Early in January, in Fresno county, I saw in operation the ditching machine patented by A. McCall through Dewey & Co. Here is what it did in about seven hours' time on Saturday, January 4th: It made complete and in the best style, a side ditch 15 feet wide, sunk 18 inches in the ground and a mile and a quarter long. It runs on four wheels—oddly set on bent axles—was drawn by 16 horses and mules—two and two—and managed by Mr. McCall, with a man and boy to help. Of the 12 animals in the lead, the 6 off ones kept outside of the levee that was being thrown up, the near ones inside of the ditch, while the 4 near the machine all kept inside the ditch. Each levee is raised to a uniform hight of about 18 inches. The incline on its inner side was three to one, but it can make them two to one, or even one to one. Before beginning on the ditch in question, the machine went one and a half miles to work and made a half round on another one and a quarter miles of ditch. The shear that does the work is 10 feet long, and will last from 30 to 60 days. It costs about $9. The cost of repairs for the month amount to only $4 or $5 besides. The expense for men, team of 16 and outfit, is about $22 per day. During its seven hours of work, on the day in question, it removed over 3,000 yards of earth. This will give your readers an idea of the cost of ditching by its use. Mr. McCall informs me that with six or eight animals it is a fine leveler. It can be varied to suit different grades and widths, cutting from three to eight feet by a single cut. The machine I saw has worked in 14 or 15 counties, and had made up to that time in Fresno county some 75 miles of main and side ditches. It has been used considerably for railroad grading, and the noted contractors, Turtin and Knox, estimate that with it 12 horses and 2 men can do as much as 26 men and 40 horses with scrapers, or 90 Chinamen with shovels.

Gold and Silver Mining in Mexico.

Editors Press:—From a letter written by Mr. Thomas Abrams, dated Guanajuate, March 15th, I extract the following, which will undoubtedly interest the many readers of your valuable columns. Among other interesting facts he goes on to state: "There was one bonanza here which was equal to the Comstock in its best days, and lasted 100 years. There have been many others nearly equal to this, and during all this time the people did not understand the *beneficio* well. There are plenty of similar places, and within four or five miles from here there is a large ravine that has gold that I believe would pay 25 cents to the cubic yard and water to wash, and I would guarantee to show more veins of silver and gold on a paying lay than could be worked in 300 years. These lodes are low in silver and high in gold. The silver would assay about six to eight dollars per ton; gold, about from 500 to 1,500 grains per ton. These veins are in the gold-bearing districts, where the Indians work in the rainy season and make from 25 to 50 cents per day. They would not wash a cubic yard in three days to the man. The principal thing they use is a cow's horn split lengthwise for concentrating. Laboring Indians can be got here for from 37½ to 50 cents per day. Provisions are cheaper than in California."

There are points of interest contained in other letters which will be given at another time.

H. W. Rice.

Mining Laws.

Editors Press:—Seeing an article in your issue of March 8th, by "Assayer," from Arizona, I have concluded to enter my protest to any more legislation on mining laws. He admits that miners consider the law of 1872 good enough; and so do I. As a general thing mining camps are hard to find, and are only found by enterprising prospectors, and as soon as a new discovery is heard of, a rush takes place; and if discoverers could only take one claim, the chance are that the class who lay round town waiting for the news of a find, would get the whole benefit of the discovery, as it takes a long time in many cases to determine what is good and what worthless. It would be impossible to legislate so as to suit all parties, and —as I understand it—the existing law was framed in the interest of the working miners, or so as to give those of small means as nearly an even show as possible. I hope it may remain in force, more especially as it is giving more satisfaction than any law, either local or otherwise we ever have had in this part of the country, the growlers to the contrary notwithstanding.

Gibbonville, Idaho.

Promising for Colorado.

A correspondent of the Chicago *Inter-Ocean* says that Colorado Springs bids fair to divide the honors in mining excitement with Leadville, Ten Mile, Silver Cliff—the northern and southern fields of that argentiferous State. Quite recently there have been discoveries of both lode and carbonate deposits of silver in the mountains five or six miles west—between the town and Pike's Peak. A true fissure vein, running through the summit of Cameron's cone, 10,000 feet altitude, and extending three or four miles in a northwesterly and southeasterly direction, has been traced on the surface, and assays show a promising degree of richness for surface. The lode has not yet been opened, but claims are staked over its discovered extent. Cameron's cone is right in front of the Peak, and the nearest summit to it.

Close to and alongside of this lode, on the east, lies a carbonate deposit the extent of richness of which is undetermined, but from which surface assays have shown profitable proportions of the white metal. So far it is not found in combination with lead, but the surface indications are pronounced similar to those of Leadville, and as there is yet but one shaft so much as five feet below the surface, there is abundant room for sanguine expectation of what is below. Iron exists in both the lode and carbonate deposits. The carbonate bed occupies an elevated basin known as Crystal park, a lovely spot a mile or more in extent either way, at an altitude of about 9,000 feet, surrounded on every side by rugged, rocky peaks, cavernous caves forming its western inclosing wall. This park is for the most part smooth and grassy, and covered now with spring flowers, and through it run bright streams of pure and cold mountain water. Its whole extent has been staked over within the last few days, and the claims extend on the hills on every side. It is easily accessible for bridle ponies in two or three hours from Colorado Springs, and a wagon road is entirely feasible.

Should these mines prove profitable, the discovery would be of great importance, and they would be very attractive because of their easy accessibility. Their development would also stimulate prospecting through the mountains of the Pike's Peak spur, which would in all probability result in more extensive discoveries of both fissure veins and carbonate beds, of the existence of which there is little doubt. Numerous stray pieces of very rich mineral have been picked up there from time to time, but the desultory efforts to trace or locate them have heretofore proved fruitless.

Bernardinite—A New Mineral Resin from San Bernardino Co., Cal.

Abstract of a paper read before the Chemical Section of the Cal. Academy of Sciences, by J. M. Stillman, Ph. B.

Through the kindness of Mr. B. B. Redding, of San Francisco, I have been put in possession of some specimens of a new mineral deposit in San Bernardino county, which has been exposed by excavations for a tunnel. The pieces in my possession are homogeneous masses of from one to five or six cubic inches in dimensions, and appear to have been broken from still larger masses. It presents a light, porous, friable mass of a light yellowish-white color, and floats on water like cork. On fracture it shows a slightly fibrous structure, and a consequent toughness, but under the microscope no definite structure, but a quantity of irregular fine fibers running in every direction through a mass of small non-crystalline, but angular fragments of some other substance. No evidences could be seen of any traces of previous woody tissue. The specific gravity of the mineral freed from air was found to be 1.166. The finely powdered mineral softens at temperatures below 100° (C.) but does not fuse perfectly when heated to 140° (C.)

With water it forms an emulsion by boiling, but no solution. In alcohol it is quite soluble. Hot alcohol (absolute) dissolves 86.6% of the native mineral; the remaining 13.4% is insoluble in boiling alcohol. The soluble portion dissolved in 5½ parts of absolute alcohol on boiling, and remained in solution when over half the alcohol had been evaporated, therefore remaining in solution in about two parts to two and one-half parts of absolute alcohol. In cold absolute alcohol it is not so soluble—the extract obtained by hot alcohol would not entirely redissolve in cold, about one-third remaining insoluble. The alcoholic solution is of a slightly yellowish color, acid reaction, and bitter taste. Ether dissolves in the neighborhood of two-thirds of the native mineral at ordinary temperatures. Bisulphide of carbon dissolves it but slightly in the cold.

The extracts in every case were amorphous, white and powdery.

The melting point of the extract with hot alcohol was variously determined at from between 115° and 120° to 120° and 125° (C.), though the substance softened at lower temperatures. Heated on platinum foil, the mineral takes fire and burns with a bright flame, with much smoke, and leaves a fixed carbon residue. When heated cautiously a portion appears to distill off without much decomposition. The ash is very slight. With concentrated sulphuric acid, it gives a brownish red color in the cold, which becomes black by warming. Water precipitates it from the sulphuric acid in black flakes. An ash determination gave for 0.3883 grammes (dried over sulphuric acid), 0.0005 grammes of a light, pure white, infusible ash, evidently silica—a mere trace.

The powdered mineral, dried over sulphuric acid, lost in weight when heated in a platinum crucible for several hours at temperatures from 90° to 125° (C.) 3.87%, probably, though not certainly, due to loss of water.

An elementary analysis of the mineral *dried over sulphuric acid*, after making allowance for ash as determined above, gave: C = 64.53%; H = 9.20%; hence O = 26.28%.

A test for nitrogen was made by igniting with sodium, etc., but none could be detected. If we admit that the lose of 3.87% above cited is due to water alone, we shall have the following as the result of the analysis: C = 64.46; H_2O = 3.87; H (not in H_2O) = 8.75; O (not in H_2O) = 22.80; ash, 00.12; total, 100.00. Or leaving out water and ash from consideration: C = 67.14, H = 9.12, O = 23.75. In caustic potash it dissolves readily, leaving but 6½% insoluble residue which forms a gelatinous mass, drying to a brown, translucent, glue-like substance. The caustic potash solution is of a clear, light, brownish-yellow color, gives a froth by agitation like soapsuds, can be diluted to any extent with distilled water without precipitation, and with dilute chlorhydric acid gives a white flocculent precipitate which settles to the bottom on standing. The concentrated solution in caustic potash becomes gelatinous on cooling, but the mass dissolves when diluted. A quantity of the native mineral was dissolved in caustic potash, largely diluted with distilled water, filtered, re-precipitated with chlorhydric acid, again filtered, the precipitate washed on the filter, dissolved in hot alcohol, also on the filter. The alcoholic solution was then evaporated, the residue dried at 100° for several hours, powdered, allowed to stand over sulphuric acid for one day and subjected to elementary analysis. The analysis gave: C = 69.71%; H = 9.59%; O = 20.70%. Total, 100%.

It is evident that the above resin is not a simple substance, from its relations to the various solvents. It is therefore useless to calculate a formula, unless as a kind of average formula for purposes of comparison. Such a formula would be $C_{40}H_{66}O_9$ (C = 69.56%, H = 9.56%, O = 20.88%). The melting point of the purified substance was found to be 127.9° (C.) for perfect fusion, although it softened more or less at lower temperatures.

The oxygen contents of the mineral, the acid character of the alcoholic solution, the solubility in the caustic potash and the soapy character of the solution, and the reprecipitation by chlorhydric acid, all point to the resinous character of the new mineral. To confirm this, the alcoholic solution of the native mineral was treated with an alcoholic solution of lead acetate, and a heavy flocculent precipitate was obtained.

It is remarkable, however, that the oxygen contents are much greater, as shown by both elementary analyses than is found in most mineral or vegetable resins.

To ascertain if all that portion dissolved in caustic potash was reprecipitated by chlorhydric acid, the filtrate obtained by the solution in caustic potash, precipitation by chlorhydric acid, and subsequent filtering, was evaporated and exhausted with absolute alcohol; a very small quantity of a yellowish, waxy extract was obtained which possessed an intense bitter taste, evidently the substance to which the bitter taste of the alcoholic solution, as well as of the mineral itself, is due, as the resin as above purified for analysis had no bitter taste. This mineral appears to differ in a marked way from any as yet incorporated into the literature.

From *Ozocerite*, *Zietrisikite*, and from all other minerals of that nature, it is entirely different, containing no paraffine, as shown by its solubility in dilute or concentrated caustic potash, by its solubility in alcohol, as well as by its elementary analysis; as all pure specimens of the minerals just mentioned contain in the neighborhood of from 80% to 88% carbon and about 15% hydrogen. From *Geocerite* it differs also in composition as well as in its much higher point of fusion, than that substance. In some of its physical properties and solubilities it resembles the imperfectly-described *Guyaquillite* from South America; differs from it, however, in chemical composition, melting point and other properties. The South American mineral, *Berengelite*, bears some similarity in elementary composition, but appears to differ from it in other essential properties.

At the suggestion of Mr. Redding I have proposed the name of "Bernardinite" for the new mineral, from the name of the locality of its occurrence. I expect soon to be able to subject larger quantities of the mineral to a more thorough investigation, with the view of ascertaining the true chemical nature of the various constituents, which are at least four, and perhaps many more in number.

University of Cal., Berkeley, Feb. 28th.

A Mountain of Gold.

The traditions of Arizona dating from the period of the Spanish conquest, now more than 300 years have always pointed to this Territory and claimed for it the richest and most wonderful mines of gold and silver in the world. The very mountains and hills were said to be veined with gold and silver and the plains to be covered in places with precious stones. Among other wonderful things in Arizona tradition has for all these ages pointed to the northeastern portion of the Territory as the seat of the great mountain of gold, a cone whose sides were said to glitter with crystal quartz veined with drops and threads of virgin gold. That in all the world this was the great storehouse of the precious metals has been believed for ages.

Time after time parties of prospectors have attempted to explore the region referred to and all have failed. Small parties at different times have traveled through, but owing to hostile demonstrations from Indians have always failed to remain long enough to find out thoroughly what really were the resources of the country. Several have found gold in paying quantities, but have been obliged invariably to leave before finding out anything definite.

Last summer James L. Hill came through the country here referred to, and claims that in prospecting he discovered the place designated by tradition as the "Mountain of Gold," and that its richness in reality is fabulous. The Indians, however, prevented him from working to any extent, and he was obliged to leave in haste.

He expects, however, to start out in a short time in company with Mr. Freeman, who has also been through that section, and a party of about 50 well-armed men, thoroughly explore the country and find out what it contains. If the country is half as rich as it is reported we soon expect to hear of wonderful fortunes being realized and that the famous "Mountain of Gold" has at last been appropriated for the use of mankind.—*Arizona Enterprise.*

Miners' Superstitions.—Like many other people, miners have their superstitious beliefs. There are few, indeed, of the gold hunters who do not nurse some strange fancy regarding the circumstance that are supposed to exercise marked influences over their operations, rewarding them with success or failure in the same proportion that they take steps towards propitiating the gods of fortune or frightening away the demons. Perhaps the horseshoe belief is the most universally accepted one among the miners, as it is also by men engaged in other industries. There are a number of the leading quartz mills and hoisting works of this district that have the doors of their offices ornamented with a horseshoe that bangs over the entrance, and some miners refuse to work unless one is put up at the entrance of the tunnel or main drift. In gravel mines these symbols are also observed sometimes, but not to as great an extent as where quartz is being taken out. One large mine near this city has no less than six old rusty horseshoes about the works and drifts, and still that mine is a continual drain on the pockets of its owners. There is nothing like faith, though, and they may strike something rich yet.—*Nevada (Cal.) Transcript.*

MECHANICAL PROGRESS.

Progress of the Iron Interest.

Hon. D. J. Morrell, assistant commissioner from the United States at the Paris exposition, in bis report on the iron and steel exbibits, says:

The display of iron and steel products bas never been equaled at a world's fair, wbilo the display of machinery generally has only been equaled hy that made at Philadelphia. The Philadelphia exhibit of machiuery was more extensive and more varied tbaa that of Paris, and it poescssed an additional advantage of being more generally in motion. But the Paris exposition demonstrated more fully than the Philadelphia exhibition, or any previous international exhibition, the efficiency of machiuery in all industrial enterprises, tbe offorts of every progressive nation to obtain the best macbiuery for its own service, and the necessity imposed npon all, by their active competition with oae another, to adopt every new device and improvement wbich tends to increase, perfect and cheapen product. No nation now hae a mouopoly of the manufactnre of any kind of iron or any kind of steel, or of tbe use of any machinery necessary to their productiou. Some countries will, of course, continue to display greater enterprise than others in the utilization of their resourcee for the manufacture of iron and steel, but none of the leading nations of the world will lag behind because they bave not become practically familiar with tbe best methods adapted to this utilization.

Iron Giving Place to Steel.

But a fact of still greater general significance wae illustrated at Paris in the large aad varied display of Bessemer products which were there exhibited. All the leading iron-making countriss exhibited Bsssemer steel, and ia most every form in which other kinds of steel and all kinds of iron have heretofore been used. The Paris exposition showed that the progress made dnring the past two or tbree years in the manufacture of Bessemer steei, and open-heartb steel as well, is so great tbat statistics fail to give any proper conception of its magnitude.

The London *Times* remarks that "the Bessemer process has ruined the manufactnred iron trade." But it has done more than this, it has distributed among many countrics tbe manufacture of Bessemer steel, and thus enabled them to eupply more fully their own metallurgical wants, and the metallurgical wants of other countries, in lien of tbeir own previons partial dependence upon Great Britain itself. Here is a new revolution, or a new revelation, in connection with the world's iron industry, which was reserved for Paris to make clearly manifest through tbe abundant proofs there furnisbed of the wide distribntion of the Besoemer process and the wide snbstitution of Bessemer products for those of iron and other steel processes. And wbat bas been said of the Bessemer process, and of the injury it has inflictsd upon the Britisb iron trade, is applicable also in a large degree to the Siemens-Martin process and its modifications.

A New Departure in Car Construction.

Tbe *Railway Age* of Marcb 6tb, contains an engraving and description of a new style of freigbt ear invented by a Mr. Prosser, of Cbicago, wbicb is sucb a radical departure from tbe usual mode of construction tbat it may be regarded as a novelty and cnriosity combined. It is a structure corresponding to a four-wheel car, but in its design the wbeels and axles proper are entirely dispensed with, or rather superseded by a pair of iron or steel plate cylinders, with flanges attached to keep them on the track, and with trunnions working in a simple frame-work in tbe form of side and end sills. There is no car-body, but a mere platform extending over the cylindere and held in position by supports resting upon the frame-work helow. The cylindere are the receptacles of the freight, whicb is of course rolled around with tbe cylinders. Tbis in brief is all there ie of it. The idea is not a new one. Something very similar was proposed eeveral yeare ago, but we cannot now recall tbe particulare. Notbing came of it, bowever, and, like innumerable other noveltiee originating in the prolific brains of inveatore, it was consigned to tbe category of forgotton thinge.

Assuming tbat there are no mechanical difficulties in the practical working of tbis arrangemeat, it is easy to eum up ite many apparent advantagee as compared witb the kind of care now in use. The car ie cheap, eimple, light, durable, drawe easier, there is less friction, tbe weigbt of load is removed from the journals, the center of gravity is brougbt nearer the track, it ie indeetructible by fire, etc.; but it will readily occnr to railroad men tbat encb a contrivance would only be adapted to certain kinds of freigbt—to very little in fact except grain—and wbat effect eucb a tremendous rolling would have upon the grain, remains to be eeen. It certainly would never do to pack the cylindere witb any kind of merchandise labeled "tbis eide up, with care," nor with live stock of any deecription, nor with agricultural implements, or dairy products, or ligbt macbinery, or anything brittle or angular, or liable to damage by abrasion. Nor could fractional loads of any kind be carried to much advantage; and if available for grain traffic, tho cars would almost necessarily be compelled to run empty in making return trips. It is hardly worth while, however, to speculate on the results, as a car of this description has already been built for expriment, and it ought to be a very easy matter to test its utility.—*National Car Builder.*

Steeline.

Tbis is the namo of a new compound which has rcently been introduced by Messrs. Bauer & Co., of New York, for refining and tempering steel. They claim for it among other things that it secures absolnte safety from cracking, adds greatly to the tensile strength, and that by it use inforior grades of steel become of superior firmness and toughness to the best grades. From the directions for using, which we quote from their circnlar, it will be soen that the new compound must havo some qualities that differ greatly from those of other tempering and refining substances:

Heat the steel articlo to be tempered to a wbito heat (burn it). Cool the same off in the compouad, until almost cold; heat it again to a cherry heat, and theu cool off in fresh water. Articles whicb do not require a high tempsr, ought to be heated to a dark, scarcely preceptible red heat, before they are cooled off in water. With some experience, parties can temper steel witbout afterwards being obliged to draw the temper.

The firm give tbeir reasons for this rather unusual treatment, as follows:

All grades of steel contain more or less impurities, such as sulphur, etc., which are impedimonts to its toughness and strength. The easiest way to destory these impurities is to burn them out. By burning the steel we destroy these impurities, as well as the carbon; but by immersing the burnt steel into our compound "Steeline" we recarbonize the same chemically with tbe necessary percentage, rejecting all impnrities.

What we assert ie very easily demonstrated by taking a piece of steel, tempering one end of it ia the regular way, burning the other end, and immersing it in "Steeliue," then heating it to a lower heat than usnal, and going into water. By breaking off a piece at each end, the difference will be found surprising.—*American Manufacturer.*

Cast-Iron Forts.—The new solid iron fortifications at tbe mouth of the Weser, in the north of Germany, have just been finished. Tbere are tbree forts, containing nine 21 centimeter guns, and 10 revolving turrets, accommodating 15 guns of 15 and 28 centimeter caliber. These solid iron etructuree have a total weight of 7,650 tone; present convex and oval fronts to the enemy, and are impervioue to the heaviest artillery known. The loopholee open at the moment of firing, being ordinarily protected by oval valves of the same solid material. Botb batteries and turrets are provided with ventilating apparatus, and hydraulic engines for workiug the guns.

Hints for Molders.—To perfectly accomplish the running-in of the metal in molding, the following rnlee have been laid down by a recent writer on tbe subject: Choose if possible the thickest part of the casting for the runner, and if the casting is deep, run in tbe metal at the hottom; where tbe casting bas a flange in the form of a pipe, it is generally preferred to run the metal in at tbe flange; when tbe casting ie thin and has many branches, or when it is of great length it is advisable to run in tbe metal in the center; care should be taken to choose a place in tbe mold, so that the mold will bave no tendency to wash any part away in its first rush; and the metal should not he allowed to fall from any bight upon a weak part of the mold.

New and Valuable Steering Invention.—A new invention for eteering vessels by steam instead of hy hand was tested in New York, a fews days since, on one of the largest and most unmanageable tngs in that harbor. By the old way of steering a veesel, when tbere is a strain on the right of the rudder there is a correspondiug elack on the left, and tbis is what causes all delay and hard work in handling tbe wheel. Tbe new invention picke up this slack and holds it. No matter in wbat position or in wbat angle the rudder is placed, it ie beld as taut as though it wae etraigbt.

The Blessing of Steam Power.—The aggregate eteam power in nee in tbe world ie at present 3,500,000 borse-power employed in etationary engines, and 10,000,000 borse-power in locomotive engines. This force is maintained witbout the consumption of animal food, except by tbe minere wbo dig the coals, and the force maintained in tbeir mnscles, is to the force generatcd by tbe product of their labor about 1 to 1,080. This eteam power is equal to the working force of 25,000,000 of horsee, and one borse consumee three times as much food as one man. The steam power, therefore, is equivalent to tbe saving of food for 75,000,000 of buman beinge.

Welding Copper.—According to *Dingler's Journal*, copper may be welded if covered at a red heat with a mixture of one part phosphate of soda and two parte borax, and submitted at once to the hammer.

SCIENTIFIC PROGRESS.

Substitutes for Ether and Chloroform.

A committee of the British Medical Association has lately issusd two reports, giving an account of some very valuable experimental trials of a number of new anæsthetie agents which they have studied, with the object of finding a substitute for chloroform and ether, the agents commonly employed by the surgeon and obstetrician. Neither of these fully meets the requirements of surgical practice, the administration of chloroform being never free from danger, and always a source of anxiety on tbat account to surgical operators, and especially in operatione of a protracted naturo, where its disastrons effects npon tho action of tho heart and the respiratory organs is occasionally tbe cause of fatal consoquences; while ether, though vastly euperior to chloroform in these respects, is too tardy in its action for many important operations. The purpose of the above-named committeo was to find, if possible, an anæsthetic agent that should he as potent in its effects as chloroform, and that, at tbe same time, should affect the heart and respiration as little as ether.

From the abstract of tbeir reports, in the *Monthly Journal of Science*, it appeare that many experimental trials were mado upon frogs and rabbits, with the followiug substances: Benzine, acetone, pyrrol, bichloride of methylene, amylene, butyl chloride, ethene dichloride, methyl chloride, ethyl chloride, nitrons ethyl ether. The experimental trials of the committee witb the above-named substances were unfavorable, either for tbe reason tbat they did not complete anæsthesia, or because the anæsthesia was attended with euch violent and alarming physiological disturbances that their use in surgery was not to be thonght of. With two substances only did the committee obtain successful results; these were the isobntyl cbloride and ethidene dichloride.

Isobutyl chloride (C^5 H^9 Cl) produced complete anæsthesia in frogs, rabbits, and dogs, in from three to five minutes, and no disturbance of the heart action or of respiration was noticed when anæsthesia was contiuued for half an hour or longer. Ethidene dichloride (C^2 H^4 Cl^2), an isomeride of ethene dichloride produced from aldehyde, gave even better results than the agent above described, and the committee thereupon tested its virtues upon six patients in the Western Infirmary of Glasgow, upon whom snrgical operations of more or less severity were performed with its aid, and witb the most encouraging results. We cannot do better, in view of the importance of these researches in the interests of bnmanity, than to give the committee's conclnsions at length, as stated by our authority.

The features of special interest in tbese cases are tbe facts that there was no injurious effect observable on the respiratory mechanism, although in all casos tbe anæsthetic was given in such doses as to produce complete anæsthesia and muscular relaxation, and in one the patient was deeply under its influence for 25 minutes. 2. The pulse diminiehed in frequency and increased in volume, and in tbe deepest anæstheeia was steady, regular, full, and compressible. There was no indication of failure of cardiac action in any case—a result anticipated from what had previously been observed in animals. 3. There was never any pallor of tbe countenance, or bluenese of the lips; but, on tbe contrary, and even during the deepest anæsthesia, tbere was a healthy flush in the face, and the lips were rosy-red. Taking into account the change in the character of the pulse and in the color of the face, it would appear that in anæsthesia from dichloride of ethidene, the blood still remains in a normal amount in the arterial and capillary eystems, and does not tend to engorge the venous system and right side of tbe heart, as is apparently tbe physiological action of chloroform. It appeared, also, in further experiments witb this agent on animale, that they could live for a leagthened period in a etate of complete anæsthesia under its influence, while, on the contrary, tbey will speedily die when chloroform is used. Tbe investigations of the committee, it would appear, bave had the valuable result of supplying the surgeon with one (and possibly with two) anæsthetic agents superior both to cbloroform and ether—a result of inestimable importance for the scientific alleviation of human suffering. The committee is continuing its researchee, and a third report is expceted at an early day.

The progrees of tbe metric eyetem of weigbts aad measures appears from a etatistical table recently prepared by M. Marlaree. It is now estabiiehed obligatorily in eighteen etates, representing a population of 236.6 millions, comprising Franco and her colonies, Belgium, Holland and colonies, Germany, Sweden, Norway, Austro-Hungary, Italy, Spain, Portugal, Roumania, Greece; Brazil, Columbia, Ecuador, Peru, Cbile and the Argentine Republic. It has been made legally optional in England, Canada and tbe United States, comprising a population of 75.6 millions. It is admitted in principle, or partially for customs, in Britieb India, Ruesia, Turkey and Venezuela, eo tbat it is in use obligatorily or permissibly in twenty-five states, witb 635 millions of inhabitants. In Switzerland, Mexico, Japan and China, representing 471 millions of people, tbe decimal syetem of divieion and subdivieion is in use, but applied to other units than the meters.

A New Method of Determining High Temperatures.

In very many manufacturss an eormous degree of heat is required for carrying ont the various operations. The means hitherto at our disposal for testing thoso temperatures, which sometimes require to bo accnrately regulated, are limited by the point of fusion of the thermometrie tube.

Mr. Crova, professor at the Faculty of Scieness of Montpellier, has had the ingenious idea of bringing tbe spectroscope to the aid of the manufacturer, and his efforts bavo been most successful. By the means he has adopted, heats bitherto incalculable can be determined very preciely. The process by which he proceeds is, roughly speaking, to adopt a fixed standard, and, having settled that point, to examine by the aid of a spectroscope, the flames of the incandescent objects, and redoce them by interposing obstructives of known power to the same level as the standard. That arrangement he calls a spectro photometor. Of course, in such an apparatus, the primary data must be purely arbitrary. Mr. Crova takes as the point of departure tho heat emitted by an ordiaary moderator lamp-burning oil, and that he fixes at 1,000. In comparing other incandescent eubstances with that standard, he finds tbat the heat of a picce of platinum, warmed to tbe red in a gaslight, is 524; the same material raised to a white heat by the blow-pipe, 810; a regulation stearine candle, 1,162; an Argand burner of ordinary gas, 1,373; the oxy-bydrogen light (common gas and oxygen on lime), 1,806; the electric light (60 Bunsen elements), 3,060; and the ligbt of the sun, 4,049. Carbon, lime and platinum, when incandescent, bave tbe same power, and probably magnesium.

This new system is calculated to be of vast importance to manufactnre, by enabling the operator to regulate hie fire so as to produce tbe precise effect desired. M. Dumas, in briuging the matter under the notice of the Academy of Sciences, stated that he considered it as the greatest discovery of modern times, and M. Berthelot warmly supported bis statement.—*Galignani.*

Science in the Industries.—Hitberto tbe syrup produced in the process of the manufacture of sugar from beet root has been but little bettsr tban a waste product. But the science of chemistry has recently come to the aid of the heet sugar manufacturers in the following manner, condensed from tbe *Am. Jour. of Pharmacy* for March: "As one of the most striking improvements in applied chemistry shown at tbe late Paris exbibition, *Dingler's* refers to the process of Vincent and otbers for working over the molasses residues from tbe beet sugar manufacture, whicb have of late been introduced in France, and by wbich it has been found profitable to turn to useful account, in producing several valuable products, what was long regarded as a waste product. These molasses residues (after extracting the potasb salts) are submitted to a dry dietillation, in which process gases, tar and mucb condensed water are obtained. From the last named (which alone is useful) there are obtained ammonium eulphate, methyl alcohol and large quantitiee of crude tri-methylamine salts. The alcohol is valnable in the manufaoture of aniline colors; and tbe tri-methylamine salte are converted, by a process of Vincent, into methyl chloride, wbich is eimilarly used, or, being an extremely volatile liquid, is used in making artificial ice." Tbe value, to the world, of this last contribntiou of applied chemistry may be feebly inferred from the fact that the annual production of beet sugar in Europe bas now reacbed the enormous annual aggregate of 1,300,000 tons, and is still rapidly increasing.

The Composition and Uses of Furnace Gases.—It has been ascertained that gases collected in the most heated parts of furnacee working iron, and rapidly cooled differ completely from tbe results given by the analyeis of Ebelmen. This able metallurgist, iguoring tbe pbenomena of dissociation, collected the gasee by slowly aspirating them through a long tube which allowed the combination of the dissociated elements. In Ebelmen's analyses, the reaction nearly always appears complete, whereae the author finds that the fumes and carbureted gases may exist in the presence of oxygen, and at the temperature of molten irou. Gas collected above tbe grating of a furnace where the bricke were at a temperature of intenee white heat, contained: Oxygen, 13.15%; carbonic oxide, 3.31%; carbonic acid, 1.04%; nitrogen (by difference), 82.5%. In metallurgical worke tbe gases ieeuing from tbe furnaces are genorally directed beneatb eteam generators, but tboy cool very rapidly againet the eides of tbe boiler; so that after traversing about 50 feet the temperature is lowcr than 500°, and tbe gases then contain per cent.: Oxygen, 7.65; carbonic oxide, 3.21; carbonic acid, 7.42; nitrogen, 81.72. Tbe quantity of oxygen hae thus diminisbed by nearly one-half, and hae been lost by its reaction on tbe finely-divided carbon which exists in great quantity in tbe atmospbere of tbe furnace.

Nobel's explosive gelatine was recently tested at tbe St. Gotbard Tunnel works, and bas been reported to possess double tbe explosive energy of dynamite. It bas the additional advantage over the latter, aleo, of keeping for an indefinite period under water without deterioration.

A CABLE will be laid in the course of a few days across Saanich Arm, connecting the land wires of the telegraph line now being completed between Victoria, B. C., and Nanaimo. The length of the cable will be about two miles.

The Tramp Nuisance.

The legal method of dealing with the tramp nuisance is urged by many of our readers in different parts of the State, and, indeed, there seems no other way to free the community from the fear and depredations of this race of outlaws. They will not work; we speak of the mass, of conrse they are sometimes honest work-seekers on foot. The only way the community can force them to earn their own living is to make them criminals and their occupation an offense against the law. This method has been in practice for a year or more in some States, notably in New Hampshire, and the result has been most salutary. Other Eastern States are adopting laws to protect their citizens from the tramp tribute, and their methods of legislation may be of interest to those who are thinking of similar movements in this State. The New York State Legislature has lately adopted an act which declares that all transient persons who rove about from place to place, and all vagrants living without labor or visible means of support, who stroll over the country without lawful occasion, shall be held to be tramps, and any person who shall be deemed to be a tramp shall be liable to punishment of not more than one year's confinement at hard labor. Any tramp who shall enter any dwelling house or kindle any fire in the highway or on the land of another without the consent of the owner or occupant thereof, or shall be found carrying firearms or other dangerous weapon, or shall threaten to do any injury to any person, or to the real or personal estate of another, shall be punished by imprisonment at hard labor in the State prison for not more than two years. Any tramp who shall willfully and maliciously do any injury to any person or to the real or personal estate of another and which offense is not now by law punishable by imprisonment in a State prison, shall be punished by imprisonment at hard labor in the State prison for not more than five years. Any person being a resident of the town where the offense is committed may apprehend the offender and take him before a justice of the peace for examination. The act does not apply to any female or to any minor under the age of fourteen years or to any blind person, nor to any person roving within the limits of the town in which he resides.

It would seem that some better method of forcing these men to support themselves could be found than the above. In this State, for example, the expense of transporting tramps half the length of the State and supporting them in the State's prison would be a grievous tax upon the people. The better plan, as it seems to us, would be to arrange some plan for putting the tramps to work where they are, and localize the system in each county. Thus, for example, the tramps might be marshalled into gangs under suitable guards to repair the roads they do so much to wear out. Or they might be farmed out to execute improvements of different kinds, public or private. We do not claim to know what would be the best way to remedy the evil by enactment, but that will doubtless appear if people will give thought and discussion to the subject.

Mining Share Market.

As usual, of late, the market for the past week has been neither one thing nor the other. There has been rise and fall, but both of so slight a nature as to be almost ridiculous, especially as being in the face of good developments, which at other times would create a strong and buoyant appreciation in the market. The outlook can hardly as yet be said to be perfectly satisfactory, but the increasing activity in the boards, and the slight hardening of values for favorite shares indicates beyond doubt that the crisis has been passed, and a better condition of things inaugurated. The Comstocks have shown more life, Ophir especially rising appreciably under the report of a new and rich strike. The trading in Bodie stocks has also been large, Bulwer being the most active in the advance. No real increase in business or improvement in stocks can be looked for till the agitation attendant on the coming Constitutional election has time to subside, and until such time we shall have to put up with the present dullness and patiently await the end. The firmness which characterized the early part of the week gave way gradually toward the end to a weak and vacillating close, there being a general depression all along the line.

Bullion Shipments.

Since our last issue, we have noticed the following bullion shipments:

Martin White, April 6th, $7,888.84; Hillside, April 13th, $4,820; Martin White, April 9th, $5,110; Paradise Valley, April 11th, $2,740.19; Independence, April 14th, $6,500; Bechtel, April 13th, $11,500; Manhattan, April 12th, $11,500; Alexander, April 12th, $8,307; Caledonia, April 9th, $6,086; Northern Belle, April 9th, $9,000; Leeds, April 8th, $4,300; Tiptop, April 8th, $21,000; Con. Virginia, April 7th, $24,536; California, April 8th, $43,029; Martin White, April 9th, $5,110; Highbridge, April 15th, $4,700.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

Mahoney.—*Ledger*, April 12: A new shaft is being sunk for working just outside the Mahoney boundaries, as the control of the mine is still a subject of litigation. By the time the shaft is sunk the lease will have expired, and the mine will fall into the hands of a majority of the stockholders.

Miscellaneous.—The managers of the big tunnel at Volcano have suspended operations for a time. It was falsely represented to the company who recently purchased the tunnel property that a large area of land was included in that property. They do not propose to proceed any further with the work until they find out the true condition of affairs. The Amador Con. mill of Sutter creek is crushing rock taken from the old dump pile. It has paid handsomely so far. Some of it has yielded as high as $7 per ton. The last clean-up of the Downs mine, at Volcano, turned out $34 to the ton. The rock carries very fine gold, and requires pulverizing very thoroughly, the mill averaging about a ton to each stamp per day. At the St. Louis mine, on Kennedy flat, work is being pushed ahead. Samples of ore taken carelessly from the dump showed free gold plainly visible to the naked eye. The Keystone and Little Amador companies paid off this week, and money is now plenty in town. The Phœnix mine stopped working recently—no timbers. The mill also came to a standstill, the dump pile being exhausted. A big drive of timbers is expected down soon. The mill has resumed work. Water in the Hercules has decreased considerably. A fine ledge is uncovered in the shaft, and the prospects are very flattering.

MONO

The Bulwer.—*Standard*, April 11: One of the richest things yet struck in the Bulwer ground is now being drifted on in a southerly direction on the 200 level. It is over two ft wide in the face, and exceedingly rich It is a part of the Homestake-Ralston series, and promises a big output of bullion in itself, regardless of what is in sight elsewhere. About 50 ft west in the crosscut, 400 level, running for the Stonewall, a large lode—full four ft wide—of superior looking, clean quartz, was passed through. Only within a day or two has the drifting been under way, but the outlook of the ledge is already mere favorable than was anticipated.

The Standard.—The chains have been finally got in place at the 700 level, so that the safety cage can be regularly employed to that depth in the new shaft. The crosscuts, driven by the air compressor and patent drills, has reached 20 odd ft both east and west. The ground to the west has materially softened. The winze on the West Standard, or Bruce ledge, has reached a depth of 55 ft, and has 18 inches of the well-known rich ore. The main old lode, as drifted on north from the main shaft crosscut east, is looking better than ever; is nearly five ft thick of high-grade ore.

The Belvidere.—The winze on the great Western, started for the purpose of determining the extent of the rich ore body, is down 30 ft. It is proposed to sink 50 ft, and then drift. The crosscut pushing west by the Bulwer company, to cut the Stonewall, will connect with the Belvidere works; the Bulwer tunnel, of course, will pass through the ground, and altogether it will be very soon quite thoroughly explored to a depth of 400 ft vertical.

Indian District.—The parties having the Neal mine bonded have returned all the papers to the owners, Messrs. McBride & Neal, and the latter are free to act as they may think best. It is likely that a thorough mill test of the ore will be made, and it will be singular indeed if the result does not prove satisfactory. At the scene of the recent excitement, Chidago, prospecting is still going on. A shaft is down on the Chidago about 15 ft deep on the line of the ledge, where the same rich character of ore is obtained. Work is not yet advanced far enough at any point to finally determine the extent and value of the discovery. At the Sultan Hill camp there is more doing than at any other point in the district, outside of the Tower mine. The Sultan Hill camp is about one and one-half miles in a direct line south of the Tower, in the silver belt, though the company also possess claims in the gold belt above, in which the Neal is located. The company have six or eight locations on the silver belt, several of which are self-evidently very valuable properties, notably the Viceroy, on which work is at present centered. Capt. Prescott, the superintendent, has made rapid progress in getting things started on a permanent basis. It is the intention to push down a prospecting shaft or winze on the line of the Viceroy ledge, which is apparently the chief lode of the belt, and of great size—30 to 40 ft in width. More or less prospecting work will be done on the other claims, but the Viceroy alone gives promise of making a silver mine of sufficient importance to satisfy most any single incorporation. Among the other locations are the Madison, Sultan, Czar and Walla Walla, all valuable—the latter especially possessing all outward indications of great size and importance.

Laurel Hill.—*Mono-Alpine Chronicle*, April 12: The mines on Mt. Wasson are well defined. The f X L, Bullion, Milner, and two other locations, are on one lode. The walls are hard lime slate, raising from 30 to 40 ft above the level of the ground, and are easily traced thus for over two miles. The ledge matter between the walls is 150 ft wide, assaying well in gold and silver. The Baltic, Whale and other mines on the same mountain are also worthy of special mention; and so, also, are the Eureka, Eva, May, Richmond, Star, and many others, such as the Mineral Chief, Mineral King and Phonograph, that assay well, and await nothing but stamps to turn out bullion. The most of the ore in Laurel Hill district will have to be roasted, but as there is plenty of wood and water, that will be accomplished with a very small outlay, and will be more than repaid by the richer yield of the ore. The country rock is lime, porphyry, quartz and considerable iron. The ledges are very large, some of them, as the Emma, Annie and Nelson, etc., averaging from 100 to 200 ft in width. The ledges uncovered in some of the canyons have bluffs of ore raising to a height of 400 or 500 ft, almost perpendicular, with a breadth of 200 ft. The ore will average over $30 per ton, across the whole bluff.

NEVADA.

Mining Notes.—*Foothill Tidings*, April 12: The Milton water and mining company, at French Corral, in this county, yielded $17,431 in February and $43,321 in March; a total of $60,752 for the two months. It is probable that dividends will be resumed this month. The Derbec and Pattison quartz ledge, on the South Yuba, near Washington, is 300 ft wide, and assays from the croppings give from $6 to $40 per ton. Very little gold is now being brought into Nevada City, owing to the large mining companies putting off their clean-ups until the end of the season. Blue gravel has been found on Gold flat, near Nevada City. Mr. Talbot prospected the lead some 200 ft, and the gravel is from two to six ft deep and rich in gold. A powder blast, consisting of 250 cases of Judson powder, was exploded in the American on last Wednesday. This blast was a successful one, tearing and loosening the ground for considerable distance. The Merrifield ("Soggs") mine is running in full blast. Large quantities of fine ore are being hoisted, and the prospects continue to grow more and more encouraging as each new development is made. A blast in the ledge at the bottom of the Scaddeu Flat incline discloses some magnificent rock, which one of the stockholders describes as "almost solid gold." The prospects of the enterprise are constantly improving, and the owners feel quite jubilant over this latest development. The pumping machinery on the Knight of Malta is about ready to start up, after experiencing much delay on account of bad weather. In order to put new blocks in one of the Manzanita mine flumes recently, a partial clean-up was made, and it came up to the Superintendent's expectations. Work in the Alaska mine has been suspended, but the pumps are kept going. The stoppage is believed to be but temporary. The Excelsior mining company, at Smartsville, has declared a dividend amounting to $11,000, payable on the 20th inst. The contractors who are putting down the new shaft at the Washington quartz mine are making excellent progress, and will soon complete their contract.

Gigantic Ledge.—*Transcript*, April 12: The Derbec and Pattison ledge is situated on the South Yuba river, near Washington, in a direct line about 11 miles northeast of this city. The fissure is no less than 300 ft wide on an average, and is solid ore matter the entire breadth. The casings of this monstrous vein, which is one of the largest on the coast, are of serpentine with outer strata of greenstone trap. The country rock is of graulte formation. Assays of ore excavated at random here and there from the croppings, yielded from $6 to $39.75 per ton. It is, generally speaking, free milling quartz, being red ochre with chromic acid and not accompanied with arsenical iron, zinc blende or base matter. A tunnel 1,500 ft in length, from the river, would give at least 1,000 ft back. By running a tunnel 600 ft from Brandy creek, it would give a back of 700 ft. The ledge has been located by the present owners for the distance of a mile.

Schmidt Mine.—*Herald*, April 12: Men are at work at the Schmidt mine grading and excavating preparatory to putting up steam hoisting works. The new incline has been started, and is at present being sunk with the aid of a windlass, which will answer every purpose till the machinery is put up. Messrs. Sheecraft & Sprague recently purchased this mine from the original owners, and it is their intention to erect hoisting works capable of sinking 1,000 ft, and to open up and thoroughly develop the mine. It is well known that there is a good ledge there, but the machinery heretofore used in pumping and hoisting was not powerful enough to admit of the deep working of the mine, and consequently its real value has never been ascertained. The old inclines were down to the depth of 60 and 120 ft, respectively; the ledge in the latter is three ft. The machinery will be in place and the mine in complete running order in about two months.

Jottings.—*Transcript*, April 12: The Omega Con. hydraulic mining company is running with full force. They have three monitors throwing water against the bank, and are making good progress in washing off the ground. The claims are under the superintendence of Mr. R. O. Tully, and he employs white men exclusively. There are at present only 10 men at work in the mine. Some prospecting is being done in that vicinity, but it requires capital to operate in opening up the deep channels found. The Arthur mining company have struck the richest kind of ore, and considerable of it, in their mine in Mount Rose district. The Brunswick mining company, who work from the same shaft as the Thomas company, have been embarrassed financially to such an extent as to necessitate temporarily shutting down. The Wyoming company have a fine ledge which varies from 10 inches to 6 ft in thickness, and the rock pays about $17 per ton in free gold, while the sulphurets go from $98 to $103. The machinery is run by water power, and the mine can be worked very cheaply.

PLACER.

Brief Notes.—*Herald*, April 12: The Central cleaned up between $5,000 and $6,000 for 10 days' run. There is the least expense attached to this claim of any claim in this district; no powder being require to break up the bank. The Southern Cross also cleaned up last week, the amount not ascertained, but it was very successful. Work has been resumed on the old Bellevue mine, near Crator hill. A shaft 50 or 60 ft in depth has been sunk, and a well-developed ledge was struck last Tuesday. Some half a dozen men are employed there.

SHASTA.

Big Thing.—*Independent*, April 11: A rich ledge has been discovered near Slick Rock, about three and a half miles from the Conway location, which, from all accounts, beats anything yet discovered. The ledge is owned by William Murray, E. O. Baker, Fred Ten Eyck, and Mr. Vandevear. Mr. Murray says that he has drawn a line over the ledge to a distance of 1,000 ft, and that it will average three ft in width, the rock in some places assaying as high as $1,000 to the ton. It is composed of rotten quartz that is completely speckled with gold.

SIERRA

Items.—Downieville *Messenger*, April 5: The Highland Mary tunnel, at Wahoo, is now in about 900 ft. The rock is much more favorable to rapid progress than it has been at any time since the work started. The "boys" at Monte Cristo are busy as bees, and intend, as the Orangers say, to "make bay while the sun shines," But little snow is left, and the trail is now shoveled out clear to the mine. There was a cave in the Dutch company's diggings, Loganville, last week, and the monitor was buried in debris.

TRINITY.

Splendid Clean-up.—*Journal*, April 12: Deadwood district gives promise of being one of the richest quartz sections on this coast. Last week a 91-ounce clean-up in the Vermont mine paid at the rate of over $50 to the ton. This week, Frick & Davis have eclipsed that, as they show $4,900 from 43 tons of rock crushed in an arastra. The Monte Christo and other mines in the district are reported as looking splendidly.

NEVADA.

WASHOE DISTRICT.

Belcher.—Gold Hill *News*, April 16: During the present week, 20 ft will be added to the depth of the main incline, and less than 90 ft now remain to be run, on the slope, to reach the 2760 level. Crosscut No. 1, 2500 level, opposite the incline, is making six ft per day, but has not yet reached through the casing of the vein. It is cutting some quartz and clay, as well as porphyry, and is in a magnificent formation. Work in the south drift, 2500 level, has been resumed. The crosscut on the south line, 2360 level, is making five ft per day, and is in 90 ft, yet has not reached the vein.

Ophir.—The main incline is averaging two ft additional depth per day through a very favorable vein formation. The bottom is to-day 15 ft below the 2300 station set. ft will be continued for a sump before the station is excavated. Work in the joint Mexican upraise from the 2100 level is making but one and a half ft per day owing to the extreme hardness of the porphyry.

California.—The joint drift, west, on the 850 level, is in 30 ft and averaging three ft per day. Connection has been made between the joint winze from the 1950 level and the upraise from the 2150 level. The C. & C. shaft is 16 ft below the 2350 level. Average daily yield of ore for the past week, 222 tons.

Yellow Jacket.—The new shaft is down 2407 ft perpendicularly. The main east drift on the 2400 level is in 126 ft, and is cutting quartz and porphyry through which some water is seeping.

Bullion.—The crosscut, 2150 level, is in 120 ft and penetrating a mixed formation of clay, porphyry and quartz. The work of chambering for the winze engine is still going on.

Sutro Tunnel.—On account of the impossibility of getting the debris out of the way with the present facilities a portion of the men employed have been discharged. There still remain 600. In three shifts of 200 each. The work of cutting out the sub-drain is making good progress.

New York.—The incline is completed to the 1200 level and sheaves are being put in at the station at the head on the 1040 level.

Mt. Hood & Vancouver.—Some 400 ft of water accumulated in the shaft during repairs; is being bailed out preparatory to taking up work on the 1400 level.

Alta.—The rock in the joint Benton incline winze is getting harder, still the 1750 level will be reached next week.

Exchequer.—The north drift, 2400 level, is in 354 ft and is averaging four ft per day through fine-looking vein matter.

Justice.—The north parallel drift between crosscuts 4 and 5 has been discontinued, and a drift has been started on south from crosscut No. 5, which is showing streaks of ore as it goes along. Only a little ore is being taken out of the surface workings of the Waller Defeat. Prospecting there is still continued. Spots of very rich ore are encountered in places.

Ward.—Laying the track and repairing the drift, 800 level, was completed Sunday, and work resumed in the face at noon of that day. Sinking is going on more rapidly since the water which had soaked into the ground has drained out.

Trojan.—Five ft per day have been added to the north-east drift from the 3d station, the face being 133 ft beyond upraise No. 5. The west drift on this level is in hard porphyry. The north drift from the 2d station is advancing rapidly in low grade ore.

Hale & Norcross.—The lighining drift to the Chollar-Norcross-Savage shaft, 2000 level, and that on the same level connecting with the Savage, have been prepared to receive the water. The water is still kept below the 2000 station.

Dandanelles.—The work of sinking the new shaft has been retarded by the character of the rock in the bottom, which for the past few days has been very hard and difficult to work owing to the frequency of seams, rendering close timbering necessary.

North Bonanza and Flowery.—No work has been done from or below the second station since Sunday. An engine and blower and a five-inch Dean pump, capable of handling 402 gallons of water per minute, are being placed in the station. On the surface the pipes are all in and the steam connections made with the new engine.

Silver Hill.—The main incline is still being continued on down, and work is going on as usual in the east drift, 1100 level. No material change of formation has occurred at either point.

Savage.—Retimbering the incline below the 1640 station, and pumping sufficiently to keep the water below the 2000 level.

Con. Virginia.—Average yield for the past week, 253 tons daily. The joint west drift, 850 level, is averaging three ft per day. The joint drift to the C & C shaft, 1650 level, is still being enlarged and retimbered. The joint west drift, 2150 level, is making five ft per day in favorable working ground.

Union Con.—The joint Mexican winze from the 1600 level is down 370 ft on the slope, in promising vein matter containing some water. The north drift, 2000 level, is averaging five ft per day, and is now 122 ft in Union ground. The rock is getting harder.

Gould & Curry.—The bulkhead on the 1900 level is being constructed. Four ft per day are being added to the joint east drift, 1700 level. The Osbiston shaft has been drained and the work of sinking will be resumed as early as Sunday. The drain tunnel is making about eight ft per day.

Lady Bryan.—Sinking is still going on, the bottom of the shaft being 130 ft below the 600 level. The drift north, 600 level, is in porphyry. Two 12-inch plunger pumps and 500 ft of column are being procured for use in the mine.

Crown Point.—The drift north, 2500 level, has been discontinued for the present. A crosscut east is being run jointly with Belcher, and is making good progress. It has not yet reached the vein.

North Con. Virginia.—The shaft has reached the 1700 level of the Sierra Nevada, where sinking has been discontinued till the repairs necessary to certain portions above are completed.

Con. Imperial.—The drift north on the 2600 level has been discontinued till the south drift, same level, has reached the Yellow Jacket workings.

Chollar-Norcross-Savage Shaft.—The pumps have not been run during the week. The water has raised so as to flow through the lighting drift to the Hale & Norcross, having been over 80 hours in raising 45 ft.

Beer & Belcher.—The drain tunnel to the Osbleton shaft is in 335 ft, and has 60 ft yet to run to connect. Sinking in the shaft will soon be resumed.

Julia Con.—The water has been lowered to the 2000 station. Pumping will not be stopped by the work of cutting the sub-drain to the Sutro tunnel. The work of sinking the winze from the 1800 level is slow, owing to the intense heat.

Utah.—The incline is to-day down 412 ft on the slope below the 1350 level, and is being continued. The partition in the incline has been carried to the bottom, and gives fine ventilatiou there.

Overman.—The O & C shaft is down 575 ft. A tank has been put in at the 550 level and the water all caught up there. Steam pumps have been also put in and are throwing the water to the surface. The water is being rapidly exhausted.

Mexican.—The joint upraise above the 2100 level is now up 80 ft. The joint Union upraise from the 2000 level to meet the joint winze from the 1000 level is averaging three ft per day in a fine vein formation, through which some water seeps.

Homestead.—The joint drain and working tunnel of the Homestead, Golden Standard, and Wheeler mines is making good advancement. The tunnel is being made seven ft in width and eight ft in hight.

Sierra Nevada.—The incline is making slow progress on account of the water flowing in at different points, the amount being all that the pumps can handle.

BELMONT DISTRICT.

Belmont.—*Courier*, April 5: The mine presents a marked improvement. They have started a winze from 300 level drift, on the pocket of ore lately spoken of, and are now 20 ft below the level in pay ore all the way. It is a continuation of the Moore & Martin chimney, and the chances for its going down to the 400 level are most encouraging at the present writing. In the south raise north end the air got so bad that they had to quit work and commence drifting from same to make connection with the 300 level drift which will take from 30 to 40 days. The 300 level drift running north is very hard, and they are making slow progress. Drift from raise on same level is making three and a half to four ft per 24 hours. The ore extraction for the next four ft per day will be light, as some openings have to be made before they can take out the ore to advantage. Have shipped 20 bare bullion, value, $9,073.23.

Higginbotham.—The ore bodies continue yielding very rich ore for reduction. The prospecting drifts show no material change. Have advanced the 6th level 35 ft south and 44 ft north. The 7th level 21 ft in hard blasting ground, making 100 ft of drifts run for the week ending this date. The mill resumed crushing Highbridge ore on the 1st.

EUREKA DISTRICT.

Secret Canyon.—*Sentinel*, April 12: The Oeddes & Bertrand mine is now worked under a lease. The main shaft is down 320 ft. Twenty ft above this point a level was opened and the drift is in 200 ft. The formation encountered is blue quartz, and pockets of rich ore are frequently opened up which go from $600 to $800 per ton. On the 75 level the drift is in 50 ft, and a winze driven down near the face has reached a depth of 20 ft. A shipment of 22 tons will take place in a few days which, it is thought, will average $250 to the ton. There is some water in the bottom of the shaft, and every Sunday the hoisting works are started up and the water hoisted to the surface. There are four claims in the Silver Cate Con. The main incline has reached a depth of 120 ft, with a very pretty ledge in the bottom. The vein, which was followed all the way down, at the widest part was three ft, but averages two ft in width. There are 30 tons of fine ore on the dump, assays from which run $105, $245 and $207 per ton. The ore in the bottom of the incline is not quite so high grade as that taken out at a less depth, yet at the time of our visit the prospect of opening up a large body of ore was very favorable. A tunnel sight was located, by means of which it is intended to thoroughly prospect these claims at a great depth. The Hogdon was the first claim located in Secret canyon, and over $30,000 was taken out within 15 ft of the surface. There are three shafts—one 234, one 170 and the other 75 ft. No crosscuts have been started in the 230 shaft. The croppings are high up and fair assays have

(Continued on Page 260.)

The Flounders of our Markets.—No. 2.

[Read by W. N. Lockington before the San Francisco Academy of Sciences, March 17th, 1879.]

Glyptocephalus pacificus, nov. sp.—On visiting ths market on the 13th of March, I found among the small flat fish exposed for sale two small specimens, which, from their excessively elougated form, and tbe considerahle thickness of the hody, seemed new to me.

These fish were between eight and nine inches long, their width was hut little more than a fourth of their length (a most remarkable proportion for a flounder) and the short head was less than the greatest depth; the moutb was very small, the lateral line quite straight; the scales minute and quite smooth; and the color dark blackish gray, with ths tips of the fius darker, approaching black.

Ths dorsal fin, as might he expected from the proportions of the fish, was exceedingly elongated and contained many more rays than that of any other of our flat-fish, the two specimens having respectively 102 and 104 rays. The anal fin was correspondingly elongated and contained 84 rays in one, 87 in ths other.

The teeth, twelve in nuniher in the lower, and nins or ten in the upper jaw, were hroad and flat, with a cutting edge, like ths incisors of a mammal, and formed a close row along the jaws on the blind side and in front, while there were none upon the colored side.

On inquiry I ascertained that a much larger individual, 14 inches or more in length, had been in the market the day before.

As I have never met with this species hefore, notwithstanding my frequent visits to the market, I coucluds that it must be of rare occurrence. Nothing at all like it has been described from tbis coast by Girard, Ayres, Gunther or Gill, and Prof. Jordan does not mention it in a list of the flounders which he was so kind as to send me.

It agrses, however, in the length of the dorsal, elongated body, smooth scales, and straight lateral lins, with ths genus *Glyptocephalus*, and I havs accordingly prepared a technical description of it under the name of *G. pacificus*.

Hypsopsetta guttulatus; Parophrys Ayresii, Gunther; *Pleuroniehthys guttulatus*, Girard.—This fish, ths "Turhot" of our market, is one of the commonest of our flounders, but is usually of small size. Occasionally, however, individuals are taken weighing as much as five pounds, and measuring 18 iuches in length. The color alone is sufficient to distinguish it from every species. On the colored sids it is, when quite fresh, of a dark olive green, sometimes hlotched witb irregular whitish spots. By exposure to the air the color deepens to nearly black. Ths under side is opaque white, liks white lead, hut along the margin of ths head from some distanes above the eye, and continuing to the anus, is a border of hright gamhoge yellow, broadest and brightest upon the snout and lower jaw. Sometimes ths whole of the under surface is yellow. It is a very broad species, in this respect rivalling and exceeding *Platichthys stellatus* (the "Flounder"); the width being nearly or quite half of the breadth. Another characteristic may be found in the teeth, which, instead of bcing a single row, form several rows, a character shared only hy one other of our flat-fish, *Pleuronichthys coenosus*, which differs widely in the color, as well as in having ths dorsal fin continued downwards along the blind side of the head, and in the very much larger eyes.

In several specimens the rays of which I counted, I found the number to agree with that given hy Gunther, viz.: 66 dorsal, and 47 anal. An individual which has been in tbe Museum a long time has, however, 72 dorsal, 54 anal rays, rather a larger variation than usual, but as I can detect no otber difference, I conclude they are the same species. Girard describes a spscies which hs named *Pleuronichthys guttulatus;* the nuniher of the fin rays of dorsal and anal in this was respectively 67 and 47; and the color "grayish or lead, sprinkled all over with black dots and white spots." After this, Dr. Gunther received ssveral specimens which he descrihes as *Parophrys Ayresii*, placing it in a different genus from Girard's species. Now Girard's *guttulatus* came from Tomales hay, and certainly ought therefore to bs found in our markets. Ths fact that I did not meet with it led me to examine and compare the descriptions of these two authors, and my conclusion is that Girard's *guttulatus* and Gunther's *Ayresii* are ths same species. In this case, the oldsr specific nams, *guttulatus*, will of course taks prscedsnce.

Pleuronichthys coenosus, Girard.—This is a very rare species, and evidently inhahits deep water, since the eyes of those I have seen protrude from their sockets, tbrough the sudden change from the pressure at the depths wbere they resided to that of the surface.

There are three characters ahout it which reuder it impossible to coufound it with any other species; the very large eyes, which equal or exceed in diameter one-third of the length of the head, from the tip of the snout to that of the gill-covers; the very short, snub suout, scarcely projecting heyond the protruding eyo; and the siugular course of tbe dorsal fiu, the front part of which, instead of endiug upon the dorsal ridge somewhere over tbe eyes, as in other species, curves over at that point to the blind side of the fish, and continues downwards along that side till it reaches a poiut level with, and not far from, the end of the maxillary or upper jaw. About eigbt rays are thus twisted over to the left side. The color also, a uniform warm reddish brown, is very distinctive. Tbe teeth, like those of the last species, (*H. guttulatus*) are in several rows, and in ths form of the hody and fins the two kinds are also much alike.

Girard's original description was drawn from a single specimen, the only one he had seen, and as yst I have only met with two individuals. It is taken near the Farallones.

Parophrys vetula, Girard.—It is difficult, without thorough examination, to distiuguish this species from its congener, *P. digrammus;* hut from all our other *Pleurenectidæ* it can be known by its elongated head, with the upper eye placed upon the dorsal ridge, so as to look obliquely upward as well as laterally; hy its elongated rhomhoidal form, the outliue of the posterior portion of the hody heing nearly straight; and by the development of the teeth upon the blind side, where thcy form a single row. In color it is usually of a uniform reddish ash, hut some of the younger individuals are irregularly spotted with darker hlotches. On tbs hlind side it is of a creamy white. The nuniher of rays in the dorsal and anal fins is not constant. In the species of *Parophrys* the upper eye is so close to the dorsal ridge that it looks obliquely upwards. So far as I have been able to ascertain, this species, together with *P. digrammus*, is not taken within the Bay of San Francisco. As the fishermen have not thought proper to give any specific English name to this species, I propose to call it ths Long Flounder. The form which, from its near correspondence with the *Pleuronectes digrammus* of Gunther, I suppose to be that species, is chiefly distinguished hy its shorter head, narrower snout, and the smaller numher of rays in ths dorsal and anal fins. The number of dorsal rays which I have found in specimens which I refer to, *digrammus*, varies from 74 to 77; that of the anal from 54 to 60. Gunther gives the dorsal 79; the anal 60. In the specimen I refer to, *vetula*, I find 86 dorsal rays, and from 64 to 68 anal rays; the numher of dorsal and the smaller number of anal rays agreeing with those given by Girard. As, bowever, I counted an intermediate number, 81, in ths dorsal fin of another specimen, I am not quite sure whether the species are distinct, or whether it is one very variable species.

Lepidopsetta bilineata, Jordan; *Platessa bilineata*, Ayres.—The first description of this fish will he found in the "Proceedings of the Cabfornia Academy of Sciences," Vol. 1. It is one of ths numerous forms described hy Dr. Ayres, and has always been oue of the rarest and least kuown of our fishes, very little having been added to our knowledge of it since Ayres wrote. It may he readily known from every other kind found here by the following characters: Many of the scales upon the body are ctenoid, that is, set upon their hinder edges with spinules; those on the cheeks are tubercular or roughened with hluntish points upon a large part of their surface; ths form is regularly oval, the width of the body almost equal to half of the total length; and the color is a quite light yellow, with irregular white spots. This last character, with the very rough cheeks aud large, rough scales, serves to infallihly ideutify the species. As in so many other of the more nearly related flat-fishes, the teeth, whicb are in a single row, are not equally developed on the two sides of the jaws, hut are principally upon the hlind side. The eyes are large, forming two-sevenths or the length of the head. This species is only occasionally brought to the markets, where, with two species previously mentioned, it bears the name of "sole." Those brought are usually of tolerahly largs size, from 14 to 15 inches long; and are caught at or near ths Farallone islands, though probably not in such deep water as *Pleurounhthys coenosus*, since ths eyes do not protrude, as is usually the case with thc eyes of fishes suddenly brought up from deep water.

Lepidopsetta umbrosa; Pleuronectes umbrosus, Girard.—This species, notwithstanding its very rough covering of highly ctenoid or comh-like scales, is by the dealers confounded with the two species of *Hippoglossoides* under the common nams of "sole." In reality it is most nearly related to the Mottled Sole from the Farallone islands (*L. bilineata*), sharing with it ths charactsrs of rongh scales aud lateral lins considerably arched above the pectoral fin. From that species it may bs very readily distinguished by its color, which is of a dark, uniform, slaty hrown; and from all othsr speciss by ths combination of the two characters first mentioned, together with its regularly ovate form and small, quits laterally-placed, eyes. It does not appear to bs very common, as I rarely find ahove two or three specimens among a miscellaneous heap of flat fishes. Those I have yet seen have not exceeded 10 or 11 inches in length.

Platichthys stellatus, Gunther; *Platichthys tugosus*, Girard.—This species, commonly called Flouuder, is by far the most abundant of the kinds brought to our market, and attains a larger size thau any otber except the Bastard Halibut (*Uropsetta Californica*). The eyes and color, are sometimes on the right side, sometimes on the left, while in all our other species they are always on the same side. It may be easily known by its short, broad form, the width exceeding somewhat the half of the length (excluding thc caudal fin); by the presence, instead of scales, of scattered, rough, stellated tubercles; and by the hlack hands upon dorsal, anal, and caudal fins; four upon the first, three upon the secoud, and three upon the last, all of them running in the direction of the rays.

This species is of wide distribution, occurring along the coast of Kamtschatka, and from thence extending by Behring's straits, Alaska, and British Columbia southward to San Francisco. How far it may occur to the south of the latter point does not appear to he known with certainty, but as it is cvidently a northern form, it is probable that its southern limit will he found near Monterey, at which point there is a mingling of northern and southern forms, resulting in an extremely rich local marine fauna; rich not only in species of fishes, but in mollucca, echinoderms, and cœlenterates.

The flounder occurs within the Bay of San Francisco, and is brought to market not only from thence, hut from various points outside the heads; some are even sent from Humboldt bay, but it is said that these are far coarser than those ohtained slsewhere, with comparatively less meat, and fetch a much lower price in the market. Thoss taken here attain a weight of 8, 10, or even 12 pounds, hut thoss sent from Humboldt hay are much heavier.

[Concluded.]

Railroad Prospects.

Dr. D. S. Baker, of Walla Walla, inteuds pushing his railroad eastward toward the Blue mountains the present season, with a view of crossing the mountains into Grand Ronde valley. The short railroad already built hetween Walla Walla and the Columbia river has proved a grand success, and has so completely demonstrated the necessity and utility of a railroad to connect the farming country witb the river that the extension eastward of this line is awaited with much anxiety. Once completed across the mountains to La Grande, an immense local trade would spring up, which would soon repay the expense of building the road. Apart from all other business, that of transporting lumber and timher from the Blue mountains for huilding, fencing, fusl and other purposes would of itself he a very important element of trade. The only serious engineering difficulties would be encountered in crossing the mountaius, and these have been fully ascertained hy accurate surveys and careful estimates, and are known not to bs at all formidable. Once in the Grand Roude valley, the road would be pushed eastward in this direction, and would not stop until it was met hy the Utah Northern, or some other road advancing from the east.

The peopls of Pendleton are urging the completion of a railroad east from Umatilla through that place. This enterprise is thought to bs in the hands of the O. S. N. Company, which is intsrested in making the country to hs traversed trihutary to their river trade.

It may be that upon reaching the Blue mountains a combination will he effected bet ween ths O. S. N. Company and Dr. Baker. This would insure the more rapid advancs of the road eastward, and bring it within easy reach of Boise City in a short time.

The project of huilding a railroad from Walla Walla to Seattle on Pugst souud, though long discussed and deferred, has been hy no means given up. It is bslieved hy many that a road connecting the Columbia basin directly with the Sound, would hs best for all interested.

The future of the North Pacific railroad, so far as the Pacific end is concerned, is at present involved in much doubt and uncertainty. It is said that the company intend huilding eastward from the mouth of Snake river this season; but it is not likely that they will do more, until compelled to, than to keep up appearances until they can get an extension of time for their chartsr; and even after that is secured they will only huild down ths Columhia as fast as ths conditions which may be imposed shall compel them.—*Idaho Statesman.*

James' Single-Track Railway.—Mr. D. B. James is constructing a car to run on the single-track railway in his hall, near the *Delta* office. The car is eight feet long—one-third the length of a full sized ons of this kind. This car is a good deal largsr thau the one he mads two or three years ago, and is large euough to prove that it can he successfully worked when put in actual use. It is not quite completed, but will hold seven or eight psrsons standing up, and runs from one side of the hall to the other with the greatest of ease. Mr. James has spent a number of years in perfecting his invention, and has succeeded in overcomiug all obstacles that presented themsslves, and there is not the least doubt that his single-track railway will work well in places for which it is adapted. The front wheel is so regulated that the car will make a curve as easily as a wagon, and the hanging platform on which the passengers are placed will prevent the car from being too heavily loaded on one side. A good locomotive it is estimated can be built for $1,500, and one for a test for $400. This is tbe cheapest railroad yet invented, and we see no reason why it could not he made to operate successfully; and it is our opinion that sooner or later this road will he as common for short lines as the narrow gauge douhle-track road.—*Visalia Delta.* [Mr. James secured his patent through Dewey & Co., and his one-track system was illustrated and descrihed in the Press some months ago.]

Honors to an American Savant.—At the annual gcneral meeting of the Royal Astronomical Society, held on Friday, February 14th, the Prcsident, Lord Lindsay, formally announced the presentation of the gold medal of the Society to Prof. Asaph Hall, of Washington, D. C., "for his disoovery and observations of the satolbtes of Mars."

Arizona Catacombs.

The Phœnix *Herald* gives the following dscription of recsnt discoveries of Arizona catacombs hy an exploring party, which will be read with interest:

Ths discovery was made about one mils east of Mountain Springs station, in the southeastern part of the Territory. Ths cave was found to have an arched entrance, about three feet wids and four feet high. Two of the explorers took the lead with candles placed in a small board and this fastened to a long pole, which was carried so that ths light was cast far ahead of them, and danger from pits or other obstacles thus avoided.

After proceeding about 100 feet down an incline, they came to the two main branches of the cave. Taking the one to the right and leaving candles at various points by which to find their way back, there being innumerable chambers branching out in all directions, they continued their way through a chamber, the walls of which, though presenting the appearance of stalactic formation, wers black and dingy, which was accounted for by the finding of ashes and other indications of fire, evidsntly very old. Here, no doubt, was one of ths haunts and resting places of the Apaches. Bones of all kinds of animals lay scattered around, no less than 200 deer antlers being seen, and other evidences of life-destruction and feasting. Animals may have done the work, hut if so they must havs had great strength to carry their prey to such a distancs.

Into this cavern they gropsd their way for a distance of 500 feet and found no end. In some places the cave was so small thsy would havs to creep through, and then suddenly would find themselves in a large room, full of gloomy grandeur, still as death and as full of mystery. Their candles giving out at a point about 500 feet from the entrance, they returned to the light of day for refreshments and more candles.

Upon re-entering, they explored ths passage to the left. The entrancs to this branch is ahout three fest high, hut narrow aud irregular for 300 feet; but passing through the aperture, the party found themselves in a large chamber with a heautifully draped stalactits ceiling, fully 75 feet above the floor. Here was glittsring grandeur, with a thousand varied beautiss and fantastic figures. This point is ahout 150 feet lower thau the entrance. From this chamher the cave, or caves, bore upward. Thers were three distinct passages, one above the other, and the explorers taking the uppsr one, went on and up for a distance of ahout 5,000 fest, until, as they believed, thsy were approaching a top entrance, the purity of the air in this hall leading them to ths conclusion that there was an exit ahove. Here again their candles gave out and they were compelled to return, only to hehold more and varied wonders, caves leading in every direction. Here and there was a small hole in the wall, into which the curiosity-seckers would thrust their torches, only to bshold immense chambers and shafts without hottoms. Every now and then the ring of ths passageway from their feet warned them that the floor upon which they stood was the roof or covering of another subterranean cave or pitfall. For five hours thsy penetrated into the dark recesses of these wonderful passages, chambers and complsx catacombs, only to arrive at the conclusion that to explore the great natural wonders hefors them would take days and perhaps months.

A Word of Caution.

The reliahle mining journals of the country are beginning to find out that it is necessary to give the people of the East caution respecting the purchase of wild-cat or valueless mining propsrty in ths West. There is an awakening interest in the East in mining west of the Rocky mountains, and it is important that that interest should bs judiciously directed and encouraged. Hundreds of impecunious and unreliable adventurers havs visited the wealthy cities of the Eastern States, and sold, from time to tims, utterly worthless property. The people who have bought the same are themselves responsible to a great sxtent for the injury dons. They were not justified in investing their monsy without first examining ths property purchased. But while many bad claims bave heen put on the market, much valuable property has besn disposed of, and many people have gained wealth hy investing in mining.

The gold and silver mines west of the Missouri river yield over $100,000,000 annually, and profitable purchases can, with care, he made almost at any time, hut caution must hs exercised and the door closed against unprincipled adventurers. It is generally conceded that there never was a better time for engaging in legitimate mining on the Pacific coast, than the present, but discrimination in the properties offered for sale must he made. Because one mine pays dividends under a wise and judicious management, it does not follow that all mines will pay. Good mines will pay better than any other class of property. Colossal fortunes are often accumulated in a very few years by the mere luck of discovery.—*Silver Reef Miner.*

According to the statement of the Atchison, Topeka & Santa Fe Railroad Co., filed lately, tbat corporation owns 245.26 miles of railroad within the Colorado, of the average value of $3,500 per mile, or in all worth $858,410.

Comparative Rainfall.

(Written for the PRESS by JAMES BLAKE, M. D.)

The statistics we possess of the rainfall in different parts of the State for a number of years are valuable as showing one of the most important elements of climate in the location to which they refer. There is, however, one point of view from which the large mass of figures we have accumulated on the subject has not been investigated, but which I think is likely to lead to interesting generalizations in connection with scientific meteorology. I allude to the quantity of rain that falls at any one place in different seasons, as compared with the rainfall at other places during the same season. This relative rainfall varies very much in different seasons, as will be evident from the accompanying table, which shows the rainfall at five places for the last six seasons, the rainfall at San Francisco each season being taken as the unit. The stations selected for comparison are San Francisco, Colfax, and Emigrant Gap, on the western slope of the Sierra; the former 4,231 feet and the latter 5,270 feet above the sea; Truckee, on the eastern slope of the Sierra, at an elevation of 5,600 feet; Calistoga, and my residence in the Coast range; the former 400 feet and the latter 2,100 feet above the sea:

YEARS.	San Francisco.	Colfax.	Emigrant Gap.	Truckee.	Calistoga.	Blake's.
1872-73.....	18.02	1.60	2.04	1.21	.....	.....
1873-74.....	23.08	2.00	3.00	1.23	1.17	.....
1874-75.....	18.40	2.00	2.33	1.17	1.44	.....
1875-76.....	28.01	2.40	2.57	1.60	1.56	.....
1876-77.....	9.00	2.10	2.10	2.00	2.00	.....
1877-78.....	32.15	1.35	1.70	0.75	1.50	*2.40
Mean.....	1	1.04	3.44	1.35	1.65	.....

A simple inspection of the table shows how different is the relative quantity of rain that falls at the same place in different years. In the column for San Francisco I have put the quantity of rain for each season, and which serves as the unit of comparison. We see that whilst in the winter 1873-74 three times as much rain fell at Emigrant Gap as at San Francisco, last winter only 1.7 inches fell at Emigrant Gap to 1 inch at San Francisco. All the stations have a larger average rainfall than San Francisco, but the relative difference was the least in almost every instance during the excessive rainy season of 1877-78, and above the average difference in the season of 1876-77, when the rainfall was least. This was most marked at the station on the eastern slope of the Sierra. The average rainfall at Truckee, as compared with San Francisco, is as 1.35 to 1; but during our wettest season it was only as 0.75 to 1, whilst during the dry winter of the preceding year it was as 2 to 1. Should a more extended series of observations show that there is an inverse proportion in the rainfall on the two slopes of the Sierra, this in itself will be an interesting fact. I regret that I have not been able to bring the subject before the academy in a more complete shape. These few remarks have been made principally to point out one direction in which the data we possess on the rainfall can be utilized, and I trust that some person with more leisure than I can command, will work up the subject. In preparing this paper, and others which I hope to present to the academy, I have availed myself of the data collected by the railroad company, which have been obligingly placed at my disposal. They contain a great deal of most important matter for the elucidation of the meteorology of the State.

*I have shown the rainfall at my residence on the St. Helena mountain for 1877-78 (the only year available) as an example of the large quantity of rain that falls there, and that, too, in a season in which almost every other locality shows the least relative fall. Twice as much rain fell there as at Colfax, a station on the Sierra, 300 feet higher.

A Leadville Romance.

The Deer Lodge shaft, owned by three Leadville men, had been sunk 130 feet, and on Friday afternoon the miners were working in porphyry and iron, and the indications were good. A party of capitalists visited the shaft about noon, and considered a proposition by the owners to buy a half interest for $6,000. They were to deposit the money at the Leadville Bank before five o'clock that afternoon or lose the bargain. A few minutes after five o'clock one of the owners of the mine calmly entered the bank and asked if the money had been deposited. He received an answer in the negative, whereupon he threw his hat up in the air and executed a breakdown before the astonished gaze of the bank people. Being asked the reason for his strange antics, he paused in his contortions, and said:

"Waal, gentlemen, I kinder think them air fellers got left this yar time. A half of the Deer Lodge, just at this precise minit, is worth $60,000."

It appeare that about four o'clock the men down in the mine struck mineral. Specimens were hurriedly sent up the shaft to the owners, who quietly went down town and caused them to be assayed, the result showing silver worth $400 a ton. The only fear then was that their offer of $6,000 for half the mine would be accepted. But the capitalists overreached themselves that time, sure enough.—*Leadville Cor. Chicago Tribune.*

Useful Information.

A NEW TEST FOR FLOUR.—A correspondent of the *Northwestern Miller* says: "In regard to the best method of testing flour for strength and color, I beg to say that for the past 30 years I have adopted the practical method of boiling dumplings for this purpose as follows: I am provided with a small pair of scales, and I weigh off three ounces (which is about two tablespoonfuls) of the flour I desire to test. I place it in a small basin, and add the necessary quantity of water to make it into a dough, which tie up in a cloth, and boil for about 20 minutes. The dumpling, on the removal of the cloth, if the flour is strong and good, should present a smooth appearance, and the creases produced by the cloth should be clear and well defined; if, on the contrary, the dough hangs to the cloth, and the creases are flat and ill defined, the flour is weak, and its baking properties bad. On cutting the dumpling, if the color is good it will not darken on cooling; but flour of bad color, on the contrary, becomes darker as it cools. I use a graduated glass to measure the water. The quantity of water used to make the dough of the usual consistency varies considerably, and is also a guide to the strength of the flour, as the stronger the flour the more water it will take."

WATERPROOFING FOR LEATHER.—A good article may be made by using paraffine melted with the requisite quantity of drying oil, and casting it into suitable blocks for subsequent use. This being softened by heat, the leather of the manufactured articles, as shoes and harness, is coated with it, and placed near a fire or in a warm place, until the composition has been absorbed. When leather has been impregnated with the mixture it is not only perfectly waterproof, but it is also rendered softer and more durable. Shoes retain all their firmness and natural elasticity, and blacking makes upon them a better polish than before. This same composition is also useful for waterproofing woven goods. It is placed on the under side of cloth for garments, either by melting and applying moderately with a brush, or by rubbing with a block of the preparation. The complete diffusion of it through the texture is effected by passing the cloth between hot rollers. Fabrics prepared in this manner, while they repel water, are perfectly pervious to air. For this reason they are superior to ordinary oil-cloth and rubber goods. They also look better than garments made of rubber, as the finished appearance of the cloth is in no way changed by the treatment.

ARTIFICIAL SILVER.—A correspondent of the Burlington *Hawkeye* tells a sensational story of an alleged discovery of the artificial manufacture of silver, by Dr. T. Farriss, Jr., of the Iowa Wesleyan University, which carries one back to the days of the old alchemists. Dr. Farriss, it seems, when taking his class through a course of instruction in the primary chemical compounds, was in the habit of setting aside the refuse waters, and one day was startled by the unusual silvery reaction which had taken place in these solutions. This led him to investigate. Result—the artificial manufacture of silver, a business on which the Doctor is said to have entered now on a large scale. Of course, details of the new process are kept rigedly secret from the scientific world, though credulous capitalists may be attracted by the glittering prospect just as they have been in the past by Keeley motors, Paraff's gold process and other impossibilities.

A GOOD GLASS CEMENT.—Mix 10½ pounds of pulverized stone and glass with 4½ pounds of sulphur. Subject the mixture to such a moderate degree of heat that the sulphur melts. Stir until the whole becomes homogeneous, and then run it into molds. When required for use it is to be heated to 248°, at which temperature it melts, and may be employed in the usual manner. It resists the action of acids, never changes in the air, and is not affected in boiling water. At 230° it is as hard as stone.

PAINT AND PAPER FOR HOUSES.—In the first place, all the painted wood-work should be varnished; in this way the deleterious ingredients of the paint are rendered harmless, and the cleaning is much more easily accomplished. In regard to paper, it may be said that all rough papers should be avoided, because they collect, absorb and retain too much dust. All papers containing arsenic or Paris green in their coloring should be avoided. The smoother the surface of the paper the better. Whenever rooms are to be repapered, all the old paper should be removed.

To "dry" linseed oil without boiling it, add to old oil about two per cent. of borate of manganese, and heat in water-bath to almost 225° F., stirring well. To accelerate the process of filtering, Ehermayer advises to put first in the funnel a piece of cotton cloth folded exactly as a filter, and then outside of the cloth to place the paper filter.

SOMETHING NEW IN JEWELRY.—Articles of jewelry have lately been made in Europe from dried ox-blood. Blood is strained, dried, powdered, sifted, and pressed in molds at a temperature of about 300° F., for from five to ten minutes. The casts are then taken out and polished.

THE artificial propagation of sponges having been demonstrated by Brehms and Buccich to be possible and easy of accomplishment in the Mediterranean, although, through the ignorant prejudice of the fishing population, their very instructive experiments have as yet yielded no practical results, the *Scientific American* suggests that it might prove a profitable venture for some of our enterprising citizens to undertake the propagation of fine sponges in American waters. The Florida Keys and the Gulf of Mexico are affirmed to be suited for this purpose.

HARNESS SOAP.—Take resin soap, 2 lbs.; sperm oil, ¾ lb. Digest the soap with a quantity of boiling water, just sufficient to soften it thoroughly, when it may be triturated with the warm oil and a sufficient quantity of fine bone-black until a uniform paste is obtained. Ordinary unmixed soap turns brown many of the black pigments in use. The addition of oil is a great improvement.

A NEW THING IN WALL PAPERS.—The *Chemiker-Zeitung* states that wall-papers, in imitation of silk, are now manufactured at Aschaffenburg, dyed in the mass, and afterwards printed by means of the cylinder machine. The paper is made of cellulose. It has a decidedly silky appearance and feel, and the effect is pronounced pleasing. The designs are always executed in darker shades of the ground color.

To remove grease spots from hemp carpets, use a solution of borax, one pound to one gallon of warm water. Heat rancid oil with a little calcined magnesia, and it will be restored to its original purity.

Good Health.

Disease Germs in Diphtheria.

The recent application of the microscope to medical inquiries has developed the important fact that many diseases are occasioned by malign attacks upon the vital domain by germs of various kinds. It is well known that typhoid fever, yellow fever, malarial fevers, and most other febrile diseases, are occasioned by the introduction of germs into the system; but it has not, in many cases, been the good fortune of physicians to discover the exact character of these microscopic enemies of human life. In the case of diphtheria, many most eminent physicians and scientists are satisfied that the mischievous germ has been discovered, after a long and pains-taking search.

The germ causes of diphtheria are very minute organisms, being too small to be seen except by the aid of a very good microscope. They are so small that a row of them an inch long would contain from 10,000 to 20,000. Singly they are too insignificant to deserve attention, except as microscopical curiosities; but when massed together in the countless numbers in which they infest the mucous membrane in this disease, they acquire an importance which is often terribly great to the victim of their ravages. There are two varieties of these parasites, known respectively as *micrococcus* and *bacterium termo;* the names are certainly no more formidable than the creatures themselves, small though they are. The two organisms are always associated, and can be very easily studied with the aid of a good microscope, by anyone at all familiar with the use of the instrument, by examination of the false membrane, freshly taken from a patient.

We have just taken a small piece of diphtheritic membrane from the throat of a patient suffering with the disease, and placing it under the microscope, with a little mucous from the same source, the germs referred to are distinctly visible in great number, all actively swimming about, making the whole microscopic field alive with motion. Just so they existed in the throat of the patient a few moments ago, vigorously at work insinuating themselves into the mucous membrane, prying their way in between the cells, even getting into their interior and depriving them of the power to perform their functions, clogging the bloodvessels, causing irritation of the membrane, and, as a consequence, the pouring out of fibrous matter which forms false membrane.—*J. H. Kellogg, M. D.*

SOCIETY AND SOLITUDE.—A correspondent writes that she thinks her health would be much better if she did not get so lonesome, and asks if lonesomeness is not the cause of a morbid condition bordering on disease? To which we answer, that man by nature seeks society and also solitude. A harmonious change from one to the other is essential to the best health. Where there is too much solitude there is apt to be despondency. Where one has too much society he is apt to wear out prematurely. It is not easy to arrange life so as to have just enough of each. If every hour brings a swarm of company the result upon the moral nature is unfavorable. If, on the other hand, man is too much isolated from his fellow men his social nature suffers, and the mental faculties are not properly developed. Lonesome people who live in the country should make friends of nature; animals, plants, trees. These become to them, in a certain sense, society. A horse and dog make very good friends indeed, and rarely give offense.—*Herald of Health.*

GLOOMY THOUGHTS AND GLOOMY WEATHER.—Dull, depressing, dingy days produce dispiriting reflections and gloomy thoughts, and small wonder when we remember that the mind is not only a motive, but a receptive organ, and that all the impressions it receives from without reach it through the media of senses which are directly dependent on the conditions of light and atmosphere for their action, and therefore immediately influenced by the surrounding conditions. It is a common sense inference that if the impressions from without reach the mind through imperfectly acting organs of sense, and those impressions themselves are set in a minor æsthetic key of color, sound and general qualities, the mind must be what is called "moody." It is not the habit of even sensible people to make sufficient allowance for this *rationale* of dullness and subjective weakness. Some persons are more dependent on external circumstances and conditions for their energy—or the stimulus that converts potential into kinetic force—than others; but all feel the influence of the world without, and to this influence the sick and the weak are especially responsive. Hence the varying temperaments of mind changing with the weather, the outlook and the wind.—*Lancet.*

LET CHILDREN HAVE PLENTY OF SLEEP.—As sleep is the period for replenishing the system, for restoring the cells wasted by the nervous activity of the day—the period when the processes of digestion reach their final result, by identifying the new nutriment with the system in the place of the waste of the tissues—it follows that children need more sleep than grown persons. Many who might be plump, active and happy, if given sleep sufficient, are flaccid and sallow, weary and fretful, because they do not sleep enough to allow the demand of the system for nutrition to be supplied. Children often feel it very hard that they are sent to bed early, while the grown people sit up and enjoy themselves long after they are in bed. If any children chance to read this paragraph, to them we would say: You need more sleep than your parents, because you have to grow and they do not. You need to use a good deal of the food you eat in growing larger and stronger; if you consume it all in activity, you will not have enough to grow with. Therefore you ought to sleep a great deal, and let the body rest, if you would grow strong and healthy.

THE WILLOW AS A PREVENTIVE OF MALARIA. Mr. Von Lennep, Swedish consul, writes from "Mahazik, near Smyrna," to the London *Times* as follows: "Before the encalyptus was ever heard of in Asia Minor, I had seen the bark of the willow used as a febrifuge. I had remarked the easy and inexpensive reproduction of this tree, its quick growth in damp places, its excellent qualities for fuel and for agricultural implements, and its great advantage for strengthening the banks of capricious streams, and had thence taken every opportunity after the winter floods to stick willow cuttings along the banks of streams and other damp places in my property; also to scatter the plane-tree seeds in marshy spots. The result has been that, whereas 20 years ago the full grown trees in this neighborhood might have been counted, a luxurious growth of willows and plane-trees marks my place, fuel is abundant, fever is steadily decreasing, the meandering propensities of the streams are checked, my neighbors have come to me for agricultural implements, and I have not far to go for timber for rough purposes.

MEDICINAL EFFECTS OF ONIONS.—A mother writes to an English agricultural journal as follows: "Twice a week—and it was generally when we had cold meat minced—I gave the children a dinner which was hailed with delight and looked forward to. This was a dish of boiled onions. The little ones knew not that they were taking the best medicine for expelling what most children suffer from—worms. Mine were kept free by this remedy alone. It was a medical man who taught me to eat boiled onions as a specific for cold in the chest. He did not know at the time, till I told him, that they were good for anything else." The editor of the journal adds: "A case is now under our own observation in which a rheumatic patient, an extreme sufferer, finds great relief from eating onions freely, either cooked or raw." Dr. G. W. Balfour, in the Edinburg *Medical Journal*, records three cases in which much benefit was afforded patients by the eating of raw onions in large quantities. They acted as a diuretic in each instance.

A RESPIRATORY VAIL.—As a rule vails covering the nose prevent full respirations, but they are at times useful, as when one is exposed to dust, as in riding upon dusty roads, either by rail or carriage. In such cases a properly constructed vail keeps the dust from entering the breathing organs. The best method of making one is as follows: Take an ordinary piece of blonde 12 inches wide, over the lower four inches sew a double thickness of gossamer silk. Two layers are sewn to the piece without difficulty. Ladies may attach them to the lower part of an ordinary vail, and thus the objection made to the appearance of ordinary respirators, so much used in England, is avoided.—*Herald of Health.*

Wanted—100,000 Tone of Steel Rails.

The Week.

The week has been characterized by nothing of special importance among mining interests. Ths abundance of water this season admits of the working of both placer and quartz mines to tbsir fullest capacities. That the time has not been wasted in their development is evidenced hy the number and size of the late bullion shipments. It is estimated that during the past week the various gravel mines of Nevada county alone bave clearsd up from $100,000 to $125,000. Othsr counties speak up quite as favorably, and in all the general indications seem to grow more and more favorable with each day's work.

The workings on the Comstocks are fast approaching the points where the new bonanzas are promised and expected, and Ophir is reported to have been already fortunate in the discovery of a rich new ore body. At Sutro, 200 men have heen knocked off from the tunnel force, for the reason that there were not cars enough to run out all the dirt made hy the gangs. The shares of the Bulwer mine have been increased from 50,000 to 100,000, and the stock will he entered on the New York boards. We note also that the mines in Washington Territory and neighhorhood are awakening some interest, hut their development is greatly retarded hy inaccessibility and the rigor of the climate. Reports are still received of large prospects and attainments at Leadville, and immense crowds are heing drawn together from all parts of the oouutry, and yet, in the face of these reports, Colorado papers are cautioning people against flocking in, and stating facts to prove that nothing hut hardship and disappointment can result to the mass of the treasurs seekers. Large numhers are reported to he leaving Leadville and returning to the Black Hills and elsewhere, failing to find smploymsnt in the new camp.

Investing in Dividend-Paying Mines.

We are advised by the Eastern mining press that whils the shares of sonnd, dividend-paying mines find ready market in that quarter, worthless properties and mere prospects meet with no favor, nor are thsy ever likely to do so. Eastern adventurers have heretofore suffered so much through worthless and deceptive purchases, that they havs resolved to act with extreme caution in ths future. This we are glad to learn, snd hope they will stesdfastly adhere to this wise policy hereafter. It is a good thing for parties about to purchase mining shares to secure only those of dividend-paying properties; and let it only be known that there is a demand for snch in the East, and, we answer for it, there will be no lack of supply. We greatly mistake the capacities of our mine manipulators if they shall not be able to meet all requirements of this kind, furnishing dividend-paying mines of any pattern and to any extent. Let the people of the East or any other part of the world try the experiment, and if the managers of our mines fail to fill all orders, then we have greatly underrated their resources in an exigency of this kind. To fill a lsrge invoice would, of course, take some time; hut it can be done. If the ore required for making ths necessary amount of bullion is not just in sight, it can with a little extra effort he gouged out and hurried through the mill, a little extra milling capacity being meantime engaged to expedite the husiness; or if the ore is not in the mine, it can, of course, he obtained in the neighborhood, and if not, why then the shareholders can be assessed to pay the dividends. It is by no means so hard a matter to get a mine on to a dividend-paying basis as some people suppose. But to maintain it on such basis becomes often a troublesome business. Our mines have a had habit, after having heen brought into a dividend-paying condition, of suspending these dividends and substituting assessments in their stead. This has happened one time or another with nine-tenths of this class of mines in the country; wherefore, the Eastern investor, when he buys the shares of a dividend-paying property, can have no guarantee that it will long continue such. He may fondly believe, as he did when a year or two since he bought the bonanza stocks, that the disbursement of dividends will be, for a long series of years, as snre as the payment of interest on United States bonds, only to find in the course of a few months that he has heen grossly mistaken.

We will not expose ourselves to the charge of being invidious by pointing out with more particularity the instances in which people, hoth here and elsewhere, have been grievously disappointed through investments made in mines that it was supposed would prove to be permanently dividend-paying properties. It is enough to say that these instances have been sufficiently numerous to prove the very treacherous character of these investments, and to admonish our Eastern friends that they have a care how they buy the shares of even our dividend-paying mines.

As it was only last week that we took it upon us to suggest the need of caution in the purchase of mining properties on this coast, it may be asked what then are Eastern investors to do if both the stocks and the mines themselves are such dangerous things to meddle with. To this it may be replied, that if parties abroad desire to become interested in our mines they had better go about the business as is the practice with us on this side; that is, buy up partially or fully developed claims already located, equipping them themselves or else buy mines opened, outfitted and actively productive, being careful not to pay more in any instance than a fair equivalent for what they get. Or they might, as is the custom in all mining countries, provision and send out experienced prospectors to hunt for and take up mineral deposits on joint account, a very good plan where there remains, as on this coast, so much territory but partially explored. The mining field in this region of the extreme West is very extensive; its forms of wealth are varied, and it is, comparatively speaking, but little occupied, offering every inducement for parties to enter and search after metalliferous deposits for themselves. As an encouragement to this course it may he stated that more valuahle mineral developments, productive mines and promising prospects included, have been made in Mono county, California, within the past two years than have within a like period ever before heen made in any county in this State; and yet Mono was overrun with prospectors as much as 16 or 18 years ago and afterwards almost totally ahandoned, simply because the first crop of prospectors lacked the pluck, or rather perhaps we should say the means, to open up the gold-hearing lodes that so abound here, to even the most inconsiderable depths. California, the most thoroughly explored and extensively worked of all our Pacific coast possessions, after a thirty years' mining experience, remains to energetic enterprise hacked by ample pecuniary means an almost virgin field, the whole State from San Diego to Siskiyou being full of undeveloped and undiscovered mines of gold and silver. In scarifying the surfacc here and there we have scratched out the more superficial deposits of gold dust, hut have as yet done hardly anything towards developing the deep-lying placers or the metalliferous veins, the sources of a much larger and more permsnent wealth.

We know well how badly, in many instances, capitsl has fared, even in California. But we ars of the opinion, for ressons not long since set forth, that investors in our mines will be more fortunate hereafter thsn they havs been. There has not heen much money lost in mining of late, the fortunes of this class of investors having taken a turn here several years ago; and we incline to the belief that the era of profit that has so set in will extend into the indefinite future—satisfactory gains being the rule, and not, as heretofore, the exception. At all events we are impressed with the idea that money embarked in practical mining will be ssfer and more likely to earn something continuously, than if invested in the shares of even dividend-paying properties. If only there was any certainty that these disbursements could he kept up steadily and permanently, then, to be sure, would these securities prove a very enticing sort of investment, as they are apt to bs liberal enough while they last. But the trouble is they do not last long, as ths history of this class of properties on the Pacific coast tends to show. Of all the mines whose shares are now called at the San Francisco and the New York stock exchangss, scarcely a dozen are yielding a net revenus. Two years ago, when the bonsnza mines were paying dividends, and were gensrally esteemed a desirable investment, tbs principal owners of these sbares were buying largely United States four per cent. bonds, and subsequent events have approved their financial acumen. Only one year since Bodie shares were largely bought up at extravagsnt figures, ths public being assured that there was ore enough in sight to make dividends certain for a long time to come, and yet some months have elapsed sincs Bodie passed over to ths list of profitless mines.

The number of these dead properties, so once of good repute and excellent promise, is, indeed, so great that one is almost forced to conclude that they were only by a spasmodic effort rushed into a seeming and short-lived prosperity that their worthless shares might be unloaded upon the public, and we counsel our Eastern friends to beware, lest, while they are congratulating themselves on their shrewdness in buying only the shares of divident-paying mines, they be preparing for themselves a bitter disappointment.

Stock manipulators on this coast are not more unscrupulous than stock operators elsewhere, but they are not the philanthropists to offer mining shares or anything else at much less than what they believe to bs their real value simply for the good it will do others. If they offer these shares on the Eastern market, it is because they expect to get the full worth of them. But, as this whole business is merely a species of gamhling, intelligent people everywhere ought to know something of the chances they take when they engage in it. If, depending on long practice or their natural astuteness, they think they can "beat the game," it may, perhaps, be as well for them to continue "bucking" against it till that point is determined in the affirmative or otherwise. We have no advice to give those engaged in, or who purpose to engage in, stock dealings. This is a mining journal, not the organ or adviser of speculators in mining shares. Our work lies in another direction. We have to do with the practical branches of the business. It is ours to counsel and advise with those who toil and invest in the fields of this mighty industry, and for them ws have words of good cheer. The best days of mining are before them. Its great successes remain to be achieved. What has been done will he as nothing compared with what we shall soon accomplish. We are apt to think that '49 was the epoch of great things, but a hundred men shall shortly produce more bullion than ten thousand did in the early days. This industry is embryotic; it has not yet reached its infantile state. The new men, who are now coming here from the Eastern States and from Europe to engage in practical mining, will yet be accounted almost as mnch pioneers as those who came thirty years ago.

That those in the East, who have studied this matter closely, take the above view of it is evident from the number who are now coming to this coast with the intention of spending here enough time to acquaint themselves thoroughly with our mineral resources through a personal inspection of the same. In times past, the most of those who have visited us on errands of this kind have been only speculators, agents or middlemen. But now, principals, capitalists and thorough-going business men begin to make their appearance, having concluded to come and see for themselves. If now these parties will proceed with this business leisurely, availing themselves of the services of competent experts, being careful to select such as have had large practical experience, they can hardly fail to find, in almost any of our mining counties, properties in which it will do to invest their money, and that can be obtained on terms that will leave no reasonahle grounds for complaint. There are in this State vein mines, as well as hydraulic and drift diggings, that strongly invite examination. Then, too, we have sea heaches to he worked, modern river beds to he dredged and deep hasins to be cleaned out, to say nothing of the vast accumulations of rich tailings that call for re-washing. The mineral wealth of other countries is apt to be confined to one, or two forms at most. But here in California it takes on many shapes; our assortment, to adopt the language of commerce, being choice, varied and complets.

The Restless Blacks.

Since we commented last week upon the emigration movements among the negross of ths Southern Statcs, there have been received dispatches annouucing that the people are still in motion, and various objective points are being borne down upon. We notice tbat in a mseting favoring tbs emigration, held in New York city, one of the speakers encouraged ths idea that California bs made ths promised lsnd of ths new exodus. This orator clsimed that thousands of negroes could easily find employment "along the coast" in this State. What this throng could do unless they take to hunting "coast whales," it is difficult to imagine. It is true thst our coast counties are prosperous, and the chancs for steady employmsnt is as good, if not better, than elsewhsre in the State, but there is no reason to expect that a throng of dependent lahorers like ths negroes, who are douhtless, for the most part, wholly unacquainted with our various styles of work, could find the asylum they need. If adequate cspital and effective management were furnished it is possibls that soms parts of our Stats would bs found admirably adaptsd to cane and cotton growing. But these industries have not passed the expsrimental stage in this State. If the reduction of the labor force of the South should rsducs the cotton supply, there would bs an advance in price which might make our cotton ventures attractive, but this is problematical. As for csne growing on a large scals, it is a branch which it would take time to devslop even if climatic and pecuniary conditions should be favorable. It is plain to our minds that a lsrge influx of negroes would be unfortunate for the immigrants and a burden to the State. For the negro has grown under a system of lahor most unlike that which prevails in this State. He is wholly unaccustomed to shift for himself. The old regime of the plantation made him the object of the planter's especial care, and he is probably the most dependent laborer in the world. Here the case is exactly otherwise, and the laborer is thrown upon his own resources as soon as the heavy work of the season is done. Even if a number of the negroes could find work during harvest, it would be work to which they are wholly unaccustomed and their earnings would be small. When harvest is over they would go to swell the burden of improvident and dependent men, of which the State has already a surfeit. It is possible that if a number of ths men should reach this coast they would be forwarded to the cane fields of Hawaii where they are needed, but the movement would be a hazardous one unless arrangements were made beforehand with the capitalists who are carrying on the Hawaiian enterprises.

Our State would welcome a larger population it is true, but it should be composed of men fitted by disposition, skill and money to undertake moderate ventures of their own. There is no reason why the unskilled, the dependent, and the empty-handed should make this State tbe goal of their wanderings.

The Western Shore Ice Company.

We visited this week the works of the Western Shore Ics Company, at 821 Battery street, and saw the machinery for the manufacture of ice, which we illustrated and described a short time since. Ths ice mads is very clear and solid, and does not have the snowy appearance common to most manufactured ice. The machinery which they have in operation is capable of making a ton and a quarter of ice per day, and is kept running simply to show the process. They have made two other one-ton machines and a five-ton machine.

In places where power is already in use and available, ice can he made at a less cost than where a separate engine is used. The apparatus is very simple in its operation and not likely to get out of order. It requires only the attention of one man. By the peculiar system of agitation of the water during the process of freezing the resultant ice is clear and hard, and contains no air, as artificial ice usually does. It will therefore keep much longer.

A one-ton machine will make ice for a quartsr of a cent per pound; while a 20-ton machine will make it at a cost of one-twentieth of a cent. The apparatus will cool air also, and is very useful for brewers, pork packers, etc. The company are prepared to manufacture machines of various sizes for use in interior towns, where ice cau he made and sold as a business. Several of them have already heen put to use for this purpose. They are made under the H. J. West patent, which is in extensive use in Europe, where all the large hreweriss have adopted the system. Among other uses for which the machinery is invaluahle, are preserving meat, fish, vegetables, fruits, etc.; cooling mines, theaters, dairies, and for all purposes where a low temperature is desired. The company sell the machines with a guarantee to do csrtain work.

THERE are 15 logging camps in active operation within hailing distance of Olympia, W. T., and many others are preparing to start up.

A New Alden Fruit Drier.

We give helow a cut and description of heater, hoisting apparatus and system of ventilation, recently patented for the Alden Fruit Preserving Co., through Dewey & Co's. agency, which seems to present some decided improvements on the old Alden invention, both in machinery and process, and we commend the same to the candid consideration of our readers. The Alden Company has certainly done much to advertise the business of fruit growing and drying, and since the first factory was started in this State, thousands of acres have been planted to the finer sorts of fruit, with special reference to drying them. There are now some 40 Alden evaporators in this State, and probably an equal number in Oregon, and the demand for Alden goods is constantly increasing. The merchants who sell them report that the price of Alden products is about 50% higher than fruits dried by other machines, and more than 200% higher than sun-dried fruits. Alden apples are quoted at 10 to 13 cents per lb; apples dried by other machines at 5 to 7 cents, and sun-dried apples at 2 to 4 cents, and other fruits in proportion. These figures should have great weight with fruit growers, as it is but another demonstration that it is useless and wasteful to place on the market common or inferior fruits, either green or dried. The Alden products may be no better than those dried by some of the other machines, but they secured for themselves a distinctive recognition and remunerative prices in the world's markets, and owners of Alden driers will do all they can to preserve this valuable prestige.

We learn that the "Improved Alden Evaporator" has been in use during the past season in this State, Utah and other places, and has given perfect satisfaction, and that it is about to be introduced in Oregon. The greatest objection to the old Alden is the high price for the machinery and royalty, and as the royalty has been abolished and the prices of the apparatus so greatly reduced, under the new *regime*, placing the improved evaporators within the means of our fruit growers, we may look for an increased interest in this important and growing industry.

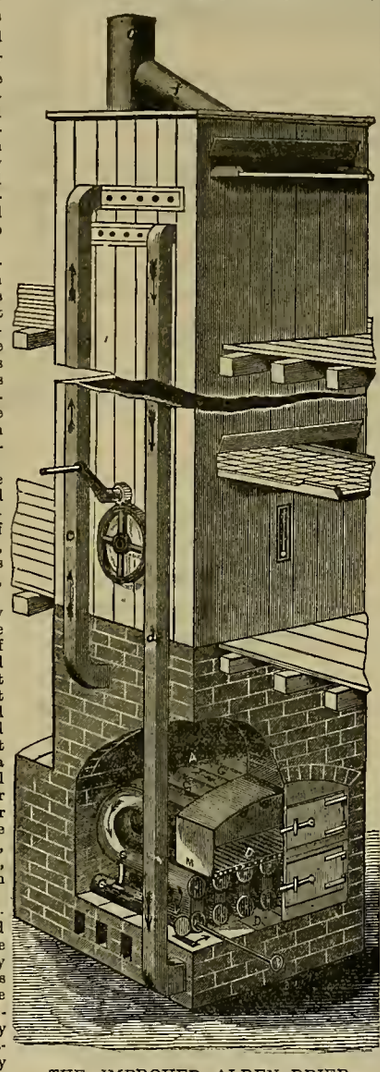
During the five years of practice which the managers of the Alden fruit company have had in this State, they have discovered room for improvement, and they now offer the result of their experiments in the shape of an evaporator, for which they claim superiority over all others in simplicity of construction and operation, durability, capacity and cheapness.

It will be noticed by the engraving that they retain the Alden process, *i. e.*, "moving the fruit, in a vertical chamber, in currents of heated and humid air;" but they have added important improvements, by which they not only generate the heat at less cost of fuel, but also apply it in a more effective manner and secure a more *rapid* current of air through and over the fruit-loaded frames. All know that the most essential thing in fruit drying is a rapid current of air. Water evaporates at all temperatures when in contact with air, or other gases. The higher the temperature the greater will be the evaporation. But if the air be heated and at rest, fruit will not dry. Wind, air in motion, is necessary to dry any substance, and more is due to the wind than to the sun, in drying the earth after a shower.

So soon as fruit is heated to a proper temperature, the affinity between the solids and liquids is broken, and if the application of the heated air is not such as immediately to carry away the watery vapor, it at once commences to consume the vital and sugary part of the fruit, by the process of fermentation, which destroys the color and the flavor of the fruit, by converting the saccharine element into caramel—burnt sugar—as in sun-drying or in any other slow method of evaporation. By the improved Alden method the saccharine matter is developed by a rapid ripening process into glucose or grape sugar; the fruit is preserved in its own concentrated juices and will keep for years in any climate; and as every particle of the fruit is subjected to precisely the same conditions of *heat*, *humidity* and *time*, the products have a uniformity of appearance and excellence of quality not attainable in any contrivance in which the frames remain stationary; so the grand secret of success in fruit drying consists in moving the fruit in a *rapid current of air* through the evaporating chamber. To secure such a rapid current of air a variety of methods have been employed, but all have failed to produce satisfactory results, except suction fans or blowers; but as such blowers add largely to the cost and operating expenses, they can never be used economically except in very large establishments.

The improved Alden patent covers improvements in air-heating furnaces, hoisting apparatus, and a novel arrangement or system of heat-distributing and ventilating flues, of which the following is a brief description, references being had to the accompanying cut: *A* is the heater, and is composed essentially of the fire-box, *D*; ash box, *D'*; and double return horizontal pipes, *G*. There are six such pipes, four inches in diameter, running parallel with each other, and the products of combustion pass through them, as shown by the arrows, and are discharged into the smoke-stack, *O*, at the back of the heater. The fire-box is surrounded by an air space, with openings, at *M*. Similar cold air openings are provided on the sides, near the bottom of the enclosing walls. The cold air comes first in contact with the lower and moderately heated pipes; then rising successively to the second and third tiers (the upper tier being the hottest), it is heated by degrees, and as the pipes are placed close together, the air is *filtered* through the narrow spaces between them, thus bringing every atom of the air into close contact with the heated pipes, which, all will admit, is a much more effective method of heating air than by radiation. Air will not heat air, and is only heated by actual contact, or by admixture of its atoms.

It will be noticed that the new furnace has an immense heating surface, and that the pipes can be easily cleaned of soot. The entire structure is made of cast iron, with very few joints, which are made perfectly tight. If the pipes are kept clean, the heat will pass readily through their walls, and as the air, coming in contact with their exterior surfaces, will carry the heat rapidly away, the pipes and fire-box will not be subjected to any destructive heat, which secures the three important considerations in a heater: First, utilization of large percentage of heat;



THE IMPROVED ALDEN DRIER.

second, atmosphere unimpaired by overheat; and third, a durable pot.

This furnace, with the flue, *d*, affords, also, a most effective and economical method of heating and ventilating houses. The furnace is placed in the basement with the usual arrangement of hot-air pipes. The fire-box is connected with the apartments above the basement by means of the flue, *d*, and in this way, perfect and cheap ventilation is secured.

In the old style of heaters, with domes and vertical pipes (which cannot be cleaned) only a very small portion of the cold air admitted into the area enclosed by the brick walls, comes in contact with the heated plates, and a large fire is required to produce the proper temperature of the air after admixture of its atoms. Such a high heat is very destructive to the furnace and impairs the vitalizing qualities of the air. Besides, the old style of heater has no convenience for cleaning the pipes and dome, and all know that the accumulation of soot and dust acts as a perfect non-conductor, so that only a very small percentage of the theoretical heat-value of the fuel is utilized—the bulk escapes through the smoke pipe and is lost.

There are several serious objections to the Alden hoisting machinery, aside from its great cost. The breaking of the lugs, or the slipping of the endless chains (which happens often), cause loss and great annoyance, and the wheels and worm screws wear out in a short time. Besides, the chains leave air spaces on the sides of the chamber, through which considerable heat escapes and is lost. The new apparatus is simple, strong and cheap, and will last for years. It is located on the first floor (the old Alden is on the top), which is a decided advantage in operating, and allows a great saving of labor and material in constructing the evaporator. The fruit frames are square and fit closely the sides of the evaporating chamber, which is, say, two inches larger from front to back than from side to side. The first fruit frame is pushed in to the *back* wall of the chamber, and is then raised about five inches by simply turning the crank; the pawls catch and hold it while the rack is turned down to its original place. The next frame is then pushed in so as to rest against the front wall of the chamber, when the operation is repeated. By this method a space of, say, two inches is left between the front and back walls of the chamber and the ends of the frames, thus giving to the heated air a zigzag course over the fruit-loaded frames in its ascent through the chamber.

The object of the heat distributing flue, *C*, is to convey hot air from immediately above the furnace, to be admitted into the chamber at one or more places between the feed and discharge doors, through openings in the wall of said chamber, which openings are provided with regulating registers. The hot air, so admitted, will force up and carry off any moisture which might otherwise condense and fall back on the fruit in the upper part of the chamber. The original Alden has no such heat-distributing flues, and the result is that the fruit often arrives at the discharge door in a wet and clammy condition and unfit for packing without further drying.

The most valuable feature of the new invention is the flue, *d*, which connects the top of the chamber with the fire-box of the furnace. When we state that it has been ascertained that the amount of air required for combustion, in one of the furnaces herein described, is about 25,000 cubic feet per hour, all of which is taken from near the top of the chamber (which chamber is closed against the external air) through the flue, *d*, the great importance of this system of ventilation will be appreciated and need no further argument. The removal of such a vast volume of air produces a partial vacuum at the top, and, as a consequence, causes a very *rapid current* of hot air through and over the fruit frames in the chamber, a condition absolutely essential, as before stated, to the attainment of highest perfection in the art of fruit preservation by pneumatic evaporation. It will be noticed, too, that the air, so supplied to the combustion chamber, is already heated, which effects a saving of fuel.

Worthington's Improved Windmill.

The top of the evaporating chamber is connected with the smoke-pipe by the flue, *f*, through which is carried off considerable air by the force of draft or suction in the smoke-pipe.

The thermometer is set into the wall with the bulb *inside* and the scale outside, as shown, so as to ascertain the temperature in the chamber without opening the feed door, as is done in the old Alden, admitting a large volume of cold air, which is very objectionable. The improved Alden evaporator has been in actual use during the past season, and we are told it has given perfect satisfaction. We are also informed that being conscious that business is dull and money scarce, the Alden company offer their new evaporator at prices in accord with the times. They furnish to each purchaser plans and directions for the erection and operation of the evaporator. Almost any ordinary two-story building (the old Alden requires a three-story building) can be cheaply altered into a serviceable factory for the large evaporators, while any room or shed about the premises will answer for the family size. No skilled labor or high salaried superintendent will be necessary to erect or operate the new evaporators. They have been sent to Australia, Utah and other distant places, and no complaint has been made.

The company are doing a good public work in giving detailed directions for preparing fruits, vegetables, hops, beef, etc., before placing the same in the evaporators, and for packing and marketing the products. We can only say here, in a general way, that it is very important that all articles, especially fruits with white meat, such as apples, pears, etc., should be placed in the evaporator as soon as possible, after being pared, *to prevent oxidation*. Cut articles, allowed to accumulate and to be exposed to the atmosphere, will soon lose their color, which no art can restore. To prevent such discoloration —browning—it is only necessary to exclude the *air* and *light*, and the simplest process is to drop such articles, as soon as sliced, into a vessel of fresh water impregnated with a small quantity of any acid—tartaric acid is cheap and quite harmless. Or, the articles may be subjected, for a few moments, to the vapors of sulphur, coke, or any other substance possessing similar bleaching properties. These methods are much cheaper and more convenient than the secret "bleaching" and "antiseptic processes," brought before the public, many of which are objectionable, because it is claimed "they diminish the nutritious quality and impair the taste of the fruit and injure the teeth and the digestive organs."

The new Alden evaporator is furnished in three sizes, of capacities ranging from 40 to 300 bushels of apples per day, and other fruits and vegetables in proportion, at prices about 400% below those heretofore charged for Alden machines. The former price of an Alden machine of capacity of 100 bushels per day was $1,500, including royalty; the present price of one of the new machines of same capacity is $400, including royalty. To show, still further, the great reduction in cost of machinery and building, the company refer to the first Alden factory started in California, which had five machines and cost $15,000. Now they are ready to contract to erect a factory of larger capacity for $3,500, including royalty, and furnish everything (except the land) complete and ready for operation. The building they promise shall be substantial and of sufficient dimensions for a factory of such capacity. The fruit frames shall have galvanized wire cloth, and the heater and all the apparatus shall be well made end of the best material. The products will be superior, under proper management, and as they may be placed on the market under the Alden brand, they will have the benefit of the prestige enjoyed by the Alden goods, to which we have alluded, and may also meet the demand for army and navy contracts which are now restricted to this class of dried fruit. The new Alden machines are being introduced to the public by the Alden Fruit Company, room 20, No. 328 Montgomery street, S. F.

A New Windmill.

In the making of windmills as of books there is no end; and so long as the inventors and manufacturers bring out good points and lessen the cost of their machines, the public interest is served. It is our practice to give notes and engravings of these new devices, in order that all our readers may know what is in the wind.

The windmill shown in the engraving on this page, is called "Worthington's Improved." The improvement has been patented by Warren D. Parson, who was the inventor of the celebrated "Colorado wind engine," which is widely known. In the Worthington improved mill it is claimed that simplicity and cheapness have been combined, with sound principles and practical working qualities.

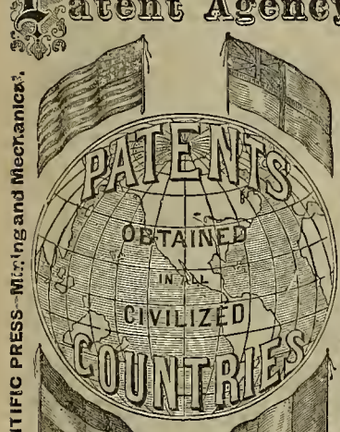
The inventor claims especial merit for the regulating features of the mill. An ingenious device, in the form of a regulating weight, causes the wheel to be extremely sensitive to start out of the wind. As it goes out of the wind the weight is compounded, offering greater resistance the farther out it goes. Thus the disposition which this class of mills have to stay in the wind too long, and to go out too far when they do start, is counteracted.

The motion to the pump-rod is communicated from a common crank in such a manner that the pump-rod moves straight up and down through the turn table, which is small and has but little friction. The wheel is balanced well on the tower by the vane. The bed plate, carrying the wheel and weather vane, is supported by a peculiar truss, which obviates the tendency to sag, causing the wheel and vane to always maintain their original positions. The inventor claims that his mill can be more cheaply manufactured than any other reliable mill in the market. He is manufacturing the mills at No. 1,364 San Pablo avenue, Oakland, Cal., and informs us that he desires to sell county and State rights of his device. The mill is represented in San Francisco by D. W. Grant & Co., No. 111 Washington street.

PERSONAL.—One of our publishers, Mr. A. T. Dewey, has left us for a two weeks' jaunt in the northern part of the State. He goes for business and recreation, and we trust the ingredients may be mingled in a comfortable ratio.

THERE are 70 ships on the English stocks and shipyards being fitted for the transportation of American live stock.

DEWEY & CO'S
SCIENTIFIC PRESS
Patent Agency.



Our U. S. and Foreign Patent Agency presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system and intimate acquaintance with the subjects of inventions in our new community. All worthy inventions patented through our Agency will have the benefit of a description or an illustration and explanation in the MINING AND SCIENTIFIC PRESS or the PACIFIC RURAL PRESS. We transact every branch of Patent business, and obtain Patents in all civilized countries. The large majority of U. S. and Foreign Patents granted to inventors on the Pacific Coast have been obtained through our Agency. The files of cases and official records in our office, our patent law and scientific library (already the lar gest west of the Mississippi), are constantly increasing. These facilities, with the accumulation of information of special importance to our home inventors, by the experience of its proprietors in an extensive and long continued personal practice, gives them combined advantages greater than any other agents can possibly offer to Pacific Coast inventors. We can give the best and most reliable advice as to the patentability of new inventions. Advice and Circulars Free. Our prices are as low as any first-class agencies in the Eastern States.

The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy,

Containing 672 Pages and 83 Engravings

BY J. S. PHILLIPS, M. E.,

Of California, a Practical Operator for Thirty-eight Years; Explorer, and Resident in the Pacific States and Territories for the past Twelve Years.

PRICE—bound in cloth, $10.50; in leather, $12. Forwarded by mail for 50c. extra, at the MINING AND SCIENTIFIC PRESS Office, by DEWEY & CO.

SAVE YOUR GOLD!

Highly Important to Miners and Quartz Mill Men!

SILVER PLATED AMALGAMATING PLATES.

The best process yet discovered for saving fine or float gold. Extensively used with great success in gravel and placer mining in various parts of the Pacific Coast. Over five hundred orders have been filled, and the demand is constantly increasing. A large number of these Plates were sent to Snake River mines, Idaho, last year, and a great many orders are being filled for them this season. Circulars containing full instructions for working these Plates sent with each order. Old Mining Plates bought or taken in exchange for new Silver Plated Plates, and full value allowed. Gold extracted from old Plates at a moderate cost by a new and economical process. Old Plates (which often contain a surplus of gold above the cost of plating) can be re-plated.

With the most extensive facilities on the Pacific Coast, orders can be filled very promptly and satisfaction guaranteed.

Mining Men and the public generally are cautioned against unprincipled and irresponsible parties traveling through the country, endeavoring to secure orders for very inferior qualities of Silver Plated Mining Plates.

Boswell Fruit Drier.

Operated by Deflected Heat.

STANDARD SIZE,
Capacity, 500 lbs.
PRICE, $75.

A Cheap and handy Drying Machine, within the reach of every farmer and fruit-raiser, with which they can dry their own fruits at home, without extra help and at very small expense. Fruit can be taken DEAD RIPE and successfully dried in the Boswell, because the atmosphere in which it is dried is heated by DEFLECTED HEAT AND RETAINS ALL THE OXYGEN IN ITS PURE STATE, which is as essential for preserving the fruit as for its growth and maturity on the tree; besides, the entire nutriment and flavor are retained. Fruit dried in the Boswell will gain from 20 TO 40 PER CENT. IN WEIGHT and 30 PER CENT. IN QUALITY over any other method. Also,

COMMERCIAL DRIERS,

With capacity for drying from 1,000 TO 4,000 POUNDS, at special rates. Also

Boswell's Heater, Cooker and Drier

Combined for family use. And

Boswell's Pure Air Heater,

In cabinet, iron or marble case, any size, for heating public Buildings, Hotels, Halls, School Houses, Churches, Hospitals, Railroad Cars, Stores, Offices, Private Residences, etc. Will heat evenly the entire building with PURE AIR, and with ONE-THIRD the quantity of FUEL required in any other Heater. Send for price list and circulars to the

BOSWELL PURE AIR HEATER CO.,
No. 606 Montgomery Street, San Francisco.

PACIFIC POWER CO.

Room with steam power to let in the Pacific Power Co.'s new brick building, Stevenson street, near Market. Elevator in building. Apply at the Company's office, 202 Sansome St., room 7.

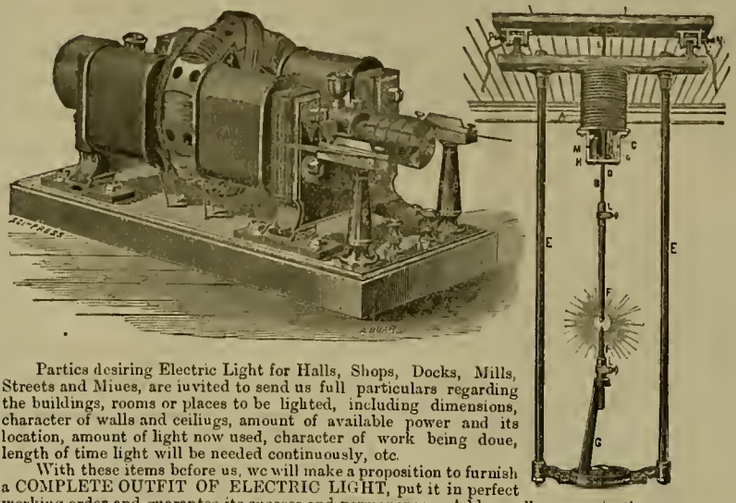
ELECTRIC LIGHT.

BRUSH PATENT.

The Best, Cheapest, Cleanest, and Most Powerful Light in the World.

In daily use at the Palace Hotel and the Union Iron Works, S. F.



Parties desiring Electric Light for Halls, Shops, Docks, Mills, Streets and Mines, are invited to send us full particulars regarding the buildings, rooms or places to be lighted, including dimensions, character of walls and ceilings, amount of available power and its location, amount of light now used, character of work being done, length of time light will be needed continuously, etc.

With these items before us, we will make a proposition to furnish a COMPLETE OUTFIT OF ELECTRIC LIGHT, put it in perfect working order and guarantee its success and permanence. Address all communications,

S. F. TELEGRAPH SUPPLY CO.,
WM. KERR, President,
San Francisco, Cal.

Ingersoll Rock Drills.

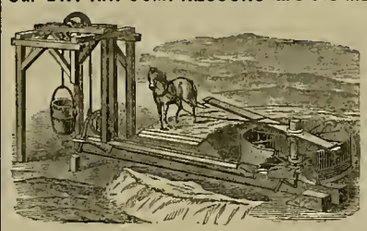
In use in the largest and best Mines of the Coast.

HAS AUTOMATIC FEED.

Has less Repairs.

Is Lighter and more Easily Adjusted than any other Drill.

Our DRY AIR COMPRESSORS are the most Economical Compressors in the Market.



MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.

The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

[Continued from page 253.]

been obtained from them. The Hogdon shows a well-defined ledge.

TEM PAHUTE.—Matters at Tem Pahute look well, and work is progressing satisfactorily. The Wysndotte ledge shows an average width of about 10 ft, and is splendidly defined at the greatest depth reached by the inclines. The ore is above the average of silver-bearing ores. Mr. Killen has no doubt that the Eastern purchasers have a valuable property. Talk is that the company will erect a mill as soon as a supply of water can be obtained.

MISCELLANEOUS.—The Jackson are hoisting their usual amount of ore, and the mine is improving as the work proceeds. Some of the directors in San Francisco are expected shortly. They come for the purpose of inspecting the mine. A large ore dump has been built at the Phenix and the work of hoisting ore will be shortly commenced. The recent strike in this mine has caused a rise in its stock in the San Francisco market. At the K. K. they are engaged in cutting out the 800 station, and when finished, prospecting will begin on this level. The force has lately been increased, and a large number of men are engaged in prospecting and stoping ore on the upper levels. The working force of the Richmond has also been increased. An average of 130 tons of ore is shipped daily. A large reservoir is being built above the Albion hoisting works, to be used in case of fire Some high-grade ore has been taken out of the Alexandria mine during the past week. Their incline is now 160 ft deep, and is following the ledge, which dips at an angle of about 65°. The Eureka tunnel is now in 635 ft, and crystallized lime and ledge matter appears in the face. Recent assays yielded $300 per ton. Work has been commenced on the Wales Con., and is being pushed forward vigorously. The sum of $35,000 was paid by the Eureka Con. for labor during the month of March. Mr. H. T. Hoadley reports that the Tybo Con. is running along as usual. The Fourth of July has liquidated all its indebtedness. Work will soon be commenced, with Mr. Thomss as superintendent.

MOUNT ROSE DISTRICT.

THE NORTH MAMMOTH.—*Silver State*, April 12: The North Mammoth mine, in Mount Rose district, recently incorporated in San Francisco, is proving to be valuable property. There are eight men at work on the mine at present. They are sinking a shaft on the vein and uncovering the ledge north and south from the shaft. The lead is from three to four ft wide, and the ore assays $25 in gold and $30 in silver to the ton. The company intend sinking to an indefinite depth, and the object in uncovering the vein is to trace it down the mountain to a point where a tunnel can be run in on the ledge at a depth of 400 or 500 ft below the croppings on the summit.

THE MINER'S DELIGHT.—This mine has a vein somewhat over three ft in thickness on the surface, and a shaft sunk to a depth of 85 ft. Within the past few days they encountered a body of ore at the bottom of the shaft, which, from certificates of assay, ranges from $100 to $623 per ton.

REESE RIVER DISTRICT.

WESTERN NYE.—Grantsville *Sun*, April 9: In the 1st and 2d levels of the Alexander mine men are at work stoping. Large bodies of ore in these levels are piled up waiting to be conveyed by the car to the mill. On the track floor between the 2d and 3d levels, the amount of ore in sight is very large. In the 4th level, work in the crosscut is progressing finely, about 14 ft having been run. The crosscut is in good sulphuret ore.

ARIZONA.

GLOBE DISTRICT.—*Silver Belt*, April 12: The owners of the Independence are timbering the drift; are satisfied with developments. The Alice is improving in quantity and quality of ore. In the southwest extension of the Alice, at a depth of 32 ft, fair ore has been developed. A new discovery, on Eagle creek, of ore-bearing copper and silver. The ledge is reported from 10 to 12 ft wide, and assays have been made from it which gives from $200 to $300 in silver. The La Plata mine, in Richmond basin, is looking splendid. The shaft on the main ledge is now down 35 ft, with three and one-half ft of ore in width, which will average $200 per ton.

IMPORTANT IF TRUE.—*Sentinel*, April 12: Castle Dome landing reports that water has been struck in the Arkansaw shaft, in such quantity as to drive the miners out of the bottom, no preparation having been made for bailing or pumping. This shaft cannot be much over 200 ft in depth. All water heretofore used at the mines has been hauled from the Colorado river, 18 miles distant. Yet the mines have been worked continuously and profitably for 10 or 12 years past. The striking of water there in considerable quantity will revolutionize the whole camp. All work hitherto has been done under windlass, and usually abandoned at depth exceeding 150 ft. With water, steam hoisting works can be put up, and the rich scams of lead ore followed down indefinitely. Some change is likely to occur in the character of the ore below water-level, but the change will probably be for the better. Immense quantities of lead ore mixed with spar for profitable shipment or reduction have been found at Castle Dome, which can be utilized, with water, for stamping and concentration works.

COLORADO.

LEADVILLE NEWS.—Cor. *Tribune*, April 0: About half a mile to the south of Fryer hill, and separated therefrom by Stray Horse creek, lie the Crescent, recently sold to New York parties; the Carbonate, Little Giant, and Ætna, very valuable mines, and all yielding paying ore in large quantities. Still farther to the south is Iron hill, upon which are situated the celebrated Stevens iron mine, the Bull's Eye, Iron Hat, and Hidden Treasure. The first named mine is believed by many to be the richest in the district, while all the others turn out rich ore in profusion. The Iron mine is perhaps the best worked in the camp, or rather the most systematically operated. The ore is of the richest quality, and it is claimed to be inexhaustible in quantity. The amount of ore in sight is fabulous. To the east, and separated from Iron hill by California and Iowa gulches, is Long & Derry hill, upon which are to be found the J. D. Dana, Porphyry, and Faint Hope, the rich mining property of the Messrs. Long & Derry. These mines are situated very near the summit of the mountain, at an elevation of upwards of 11,500 ft; are difficult of access, but exceedingly rich and productive. Ore taken from these mines is sold for $3 per pound. The grade is very high and little is sold to the mill even here, the most of it being put in sacks and shipped to Omaha, St. Louis, and Chicago. The first workings of these mines were exceedingly irregular and entirely without system, the desire of the discoverers seeming to be to find out if there was sufficient ore to justify working. None of them are now worked to anything near their capacity, for the reason that the fortunate owners have no pressing need for money, and are, in consequence, able to await cheaper rates of transportation and better prices for bullion. Other claims immediately adjoining the Long & Derry mines are being rapidly developed, with indications of the most promising character. Among these are the Last Chance, Wide Awake, and Homestake, all in excellent localities, with near prospects of rich paying ore. The best paying localities are found to be upon the four hills already named. There may be as rich deposits upon some of the other hills in the vicinity of Leadville, but as yet there are no mines sufficiently developed to warrant the statement. There are several claims in the vicinity of the Breece Iron mine that present excellent indications. The Flower of Edinburgh, located on Little Evans gulch, a mine comparatively unknown to the mining world, has been sold to Chicago parties. About 12 ft below the surface a solid bed of mineral was struck, said to be 20 ft in thickness, specimens of which assayed from 40 to 51 ounces in silver and 30% lead. The character of the ore is similar to that found in the Camp Bird, the Adelaide and Pine Lodes.

IDAHO.

ALTURAS ITEMS.—Cor. *Statesman*, April 12: The Vishnu company have been compelled to abandon work in their mine for the present, on account of too much water, but they have over 100 tons of good ore on the dump which is now being crushed. This mine is owned by George F. Settle and Jacob Reeser, and is one of the best paying gold mines in Idsho. Hon. George M. Parsons is one of the lessees that have worked it for the past three years. The Alturas mine, in Blake's gulch, is another important auxiliary, and has been worked during the past winter by six men. Thomas L. Johnson is the "commander in chief." The Wide West has yielded 150 tons of fair ore since the tunnel was completed, and the John Sheffer, owned by Pearson & Co., has also been doing as well, if not better, than the year before. Jacob Reesor has had four men at work on the Independent, and although the vein is small, the rock is rich and will pay well. A number of other mines are also turning out pay rock, so that the mills and arastras will have enough to do as soon as they start up.

BOISE RIVER.—*World*, April 12: Two hydraulic pipes are running on separate claims 10 miles below Mr. Buckley's ground. They have been in operation about a week, and the prospects are good. Mr. Buckley has reliable information that a man who is shoveling into boxes on the opposite side of the river is making $4 per day. There will be no trouble in working any of the bars, as the tailings will be dumped into the river and carried away by the large body of water.

NEW MEXICO.

MINING NOTES.—*Grant County Herald*, April 5: Repairs on Bremen's mill are progressing rapidly, and everything will be in running order by the middle of next week. J. M. Campbell, a practical machinist who has been for a long time connected with Fraser, Chalmers & Co., of Chicago, has arrived to take charge of the mechanical department of the mill. During the time that work has been suspended, the ore wagons have been busy, and some 350 tons, from the Seventy-Six mine, have accumulated in the bins. Mr. Bremen has also struck a remarkably rich body of ore in his new mine in Chloride district. This is the "Lily" purchased from J. G. Ward and relocated with adjoining ground. The new location covers 1,500 by 600 ft, and has been named the Baltic mine. Mr. Bremen struck a body of ore here soon after commencing operations, the average of which will run at least 65 ounces to the ton, while specimens, some of them weighing 40 to 50 pounds, will assay up into the thousands. About 70 tons of this ore have been taken out and delivered at the mill, and the mine still shows up as well as when the metal was first struck. Three hammers are at work on the Baltic. The Seventy-Six mine is now the deepest in the county, work on the main shaft having been pushed to the depth of 250 ft. Work will be renewed here next week. When the mill starts up, Mr. Bremen will take personal charge of the treatment of his ores.

OREGON.

RYE VALLEY.—Bedrock *Democrat*, April 9: Placer mining in Rye valley and vicinity is running in full blast, although with a limited supply of water there seems to be fair headway made. In many places the bars or flats are deep, requiring a large quantity of water to carry off so much debris; the ditch company are piping on a 60-ft bank, running night and day, and clearing $100 per day. The Rye Valley mill and mining company are, as usual, carrying on operations in and around the mine; having attempted to sink a winze recently, without the aid of a pump, the water being to much to handle by hand after reaching 20 ft in depth, the project was given up until the arrival of Supt. Fisk from Portland, where he is now procuring the necessary machinery, in the meantime work is progressing, running west in the drift, which shows a body of very rich ore.

MINING NOTES.—*Sentinel*, April 12: Piping still continues at the Centennial, at Willow springs, with every indication that the ground is paying well. The claim of V. S. Ralls, at Willow springs, is paying five ounces per day for the work of four hands, ground sluicing. Chinaman Lin's ground is evidently better than it was last year, when it paid over $100 per day to the pipe. Frank Ennis is pushing work at the Sterling. He is working in rich ground and there is every indication of an immense wash up. News from Silver creek is still favorable. A piece worth nearly $700 has been found in the claim of Black & Co. News from Briggs creek, in Josephine county, is flattering. Ferren & Co. have recently found some heavy gold in their claim, one nugget weighing $37 and another $26, being found in the gravel three ft from the bedrock.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office at San Francisco:

THE NORTH STANDARD G. & M. Co.—Object: To operate in Bodie. Capital, $10,000,000. Directors—J. McMechan, Bernard Lande, A. Burr and H. C. Van Dyck.

WESTERN G. & S. M. Co.—Object: To operate in Bodie. Capital, $10,000,000. Directors—J. McMechan, Bernard Lande, A. Burr and H. C. Van Dyck.

CARSON RIVER M. Co.—Object: To mine for coal in Washington Territory. Capital, $1,000,000. Directors—W. S. Rosecrans, Horatio McPherson, J. R. Erringer, I. W. Smith, J. F. Brodhead.

TACOMA COKE & IRON Co.—Object: To manufacture iron in Washington Territory. Capital, $500,000. Directors—C. A. Henry, J. A. Pickens, W. S. Rosecrans, John R. Erringer and J. F. Brodhead.

MONTEZUMA G. & S. M. Co.—Object: To operate in the Canton De Rayond district, State of Chihuahua, Mexico. Capital, $50,000. Directors—Samuel Hendy, Theodore A. P. Brown, Clemens Hohwiesner, Arthur Sincock and J. H. Miles.

WORTH READING.—This volume, the "Pacific Rural Handbook," contains a series of brief essays and notes on the culture of trees, vegetables and flowers, adapted to the Pacific coast; also, hints on home and farm improvements, by Chas. H. Shinn. "Enthusiasm," to quote our author, "is the birthright of youth;" but we defy anyone, though he may long have passed the period of such heritage, to seat himself to a careful perusal of these pages without becoming enthusiastic. Their merit lies in literary worth as well as in horticultural lore. The voice of experience speaks through gracefully turned sentences, which abound with sentiments of culture and refinement, and thrill with the accents of one whose heart is in his work. We read, and we long for the wings of a dove that we might fly away to that golden land where the fertile valleys, mysterious storehouses of houndless treasures, are lifting their flower-garlauded faces beneath the protecting shadows of the everlasting hills. The work is especially designed to aid the cultivator of the Pacific coast, but scores of useful hints can be gleaned from it that will prove applicable to our own colder climate. San Francisco: Dewey & Co. Price, post-paid, $1.—*Prairie Farmer, Chicago.*

THE NOTICE in our columns of an engineer who is desirous of coming to California, refers to one whom we believe to he an ahle gentleman, whose permanent establishment on this coast would be a favorahle acquisition to our building and progressive interests.

News in Brief.

A METEOR fell lately in Chicago.

NEW YORK has had an earthquake.

HAY sells for $13 a ton at Olympia.

HAY cutting has hegun in Napa county.

PEOPLE in Bolivia are suffering from starvation.

A LIGHTHOUSE is to be built on Point-no-Point.

THE widow Oliver has entered the lecture field.

AN attempt has been made to assassinate the Czar.

OVER 1,000 Nihilists have been arrested at Charkoff, Russia.

THERE is great suffering among the hlack immigrants in Kansas.

A REPUTABLE oooking school has heen opened in Boston.

UNION COLLEGE is admitting women on the same plan as Harvard.

THE manufacture of sherry wine has been commeuced in Napa county.

TWENTY-SIX tourists have so far entered the Yosemite valley this year.

AT Szegedin, Hungary, 17,000 persons are still suhsisting on charity.

PRESIDENT HAYES is getting ready to veto the army appropriation bill.

A VEIN of anthracite coal was recently found in excavating at Washington.

THE Petaluma broom factory last season made 1,500 dozen hrooms.

SIXTEEN THOUSAND persons in the prisons of the United States are unemployed.

OF the 27,000,000 inhahitants of Italy, 14,000,000 can neither read nor write.

WITHIN the past year eight Mormon girls have married colored men in Salt Lake.

THE festive grasshopper is gnawing the grass and vegetahles in the vicinity of Provo, Utah.

MOST of the natural ice used on the coast is manufactured and stored on the Truckee river.

ARMS for the Zulus are heing shipped from New York, presumahly through Russian influence.

A CONVENTION of colored men is soon to meet at Milwaukee, to discuss Western colonization schemes.

TULARE LAKE continues to fall, and the shore is heing hought from the State as fast as the water recedes.

THE Silver City jail was destroyed by the late hig fire, and prisoners are now confined in a stone cellar.

THE electric light has heen found a valuahle accessory for surgical operations in dull weather and after dark.

ON the third inst. there was something like a cloud hurst in Soda Springs canyon, five miles east of Lower Lake.

WOMEN have recently heen elected to the superintendence of schools in several New Hampshire towns.

TWO of the principal streets of Paris have had their names Americanized to Rue Lincoln and Rue Washington.

JOSIAH BACON was found dead in his room at the Baldwin hotel on Sunday under very mysterious circumstances.

THERE are 100 hostile Indians encamped on the middle fork of the Salmon river, Idaho. Settlers are hecoming uneasy.

THE first Indian ever sworn in a court of justice, in Nevada, lately testified against a white man for selling him whisky.

THE distance from Yuma to Tucson by the new railroad route will he 247 miles, a saving of 53 miles over the old stage route.

FRED DOUGLASS attrihutes the colored exodus from the South to attempts of the whites to again reduce the hlacks to slavery, hy overcharging, etc.

THE first marriage in this city, according to Chinese rites, took place lately, hetween Chas. Jamison, Chinese interpreter, and a Chinese girl named "Alice, the Angel."

TWO rival colored preachers in Texas, joined by their factions, came to hlows in the church. The preachers went home on shutters, and the police clubbed the rest to snhmission.

AN ITEM IN THE HOMESTEAD ACT.—The Register and Receiver of the Land Office in this city have issued a circular calling attention to a decision of the Commissioner of the General Land Office dated March 8th, to the effect that the Homestead Act requires residence, improvement and cultivation on the part of those who locate land under it. Therefore they say: "It will, therefore, he useless to send testimony to this office, unless it he therehy clearly shown that the claimant cultivates part of his claim. As to the least number of acres in cultivation that the Hon. Commissioner will consider a compliance with the law, this office is not informed." This announcement of the land authorities should be heeded hy those closing homestead entries.

THE Richmann drill and compressor works, of Arnold & Richmann, 13 and 15 Fremont street, are now preparing to make their patent drills and compressors on a large scale. This drill is a new invention which has accomplished some wonderful results. It is extremely light and requires only slight power to operate. We shall shortly describe the machine in detail, and meantime anyone interested can see it at work hy calling at the above address. The invention is worthy the attention of all mining men interested in machine drills.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch from Washington. D. C.

FOR THE WEEK ENDING APRIL 1ST, 1879.

213,802.—GAG-RUNNER FOR HARNESS—Wm. M. Blain, Salinas, Cal.

213,814.—COMBINED WRITING DESK AND WORK TABLE—E. Emanuel, S. F.

213,902.—WATER AND STEAM COCK—Wm. H. Hoyt, Sacramento, Cal.

213,833.—STEM-WINDING AND SETTING WATCH—J. Bauer, Petaluma, Cal. (assignee of U. Opplinger, Chaux-de-Fonds, Switzerland.)

213,839.—BARREL-TAP—E. J. Rubottom, Spadra, Cal.

213,835.—WATER CLOSET—F. Pohley, S. F.

FOR THE WEEK ENDING APRIL 8TH, 1879.

214,080.—LATCH—P. H. Baker, S. F.

8,664.—HATCH FOR STREET ELEVATORS—Philip Hinkle, S. F. (re-issue.)

214,138.—CULTIVATORS—S. B. Holly and J. Jones, Stony Point, Cal.

214,145.—SICKLE GRINDERS—T. J. Hubbell, Yountville, Cal.

214,158.—VENETIAN BLINDS—Thos. Langdon, Castroville, Cal.

214,055.—EXTRACTING PRECIOUS METALS FROM ORES—Jno. A. Robertson, Oakland, Cal.

——The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

A COPPER-PLATED FURNACE.—The Clifton copper mines situated in the extreme eastern part of Arizona, have long heen remarked for the richness of their ores, which are said to carry on an average some 50% or 60% of metal. Being suhject to several hundred miles of wagon transportation over a harren country these ores would not hear shipment to market, notwithstanding their richness, and, therefore, had to he smelted on the ground. But, owing to a lack of ordinary facilities, the smelting of these ores at the mines proved so expensive that the owners, Messrs. Sesinsky & Co., exercised their ingenuity to effect such improvements in their furnaces as would tend to reduce the same. This it seems they have at last accomplished through the introduction of copper-plated furnaces, which, cheap and simple in themselves, have also proved very durahle. These works employ 200 men, and it is expected that the output of metal will henceforth he large, uninterrupted and profitable.

Iron in New Zealand.

In our advertising columns will be found a remarkable invitation addressed to the Iron Masters of of Europe and America by the government of New Zealaud. The two great Islands which form that rapidly prospering colony are remarkably rich in iron and coal of excellent quality. The government has within a few years constructed over 1,000 miles of railroad, all the materials for which, except the sleepers, have been carried out at a heavy charge in the way of freight, etc., from England. Yet the Public Works Department of the Colony is even still, with so many lines laid down and working with a dividend, only perhaps at the outset of its labors. The present Minister of Public Works, Hon. James McAndrew, has determined to make a bold experiment to naturalize the iron industry in the Colony, and has in the terms of the notice which we publish to-day, called for tenders for 100,000 tons of steel rails (or any portion thereof) to be manufactured in the Colony from New Zealand ores. A pamphlet containing the fullest information on the subject, illustrated by maps and plans, has been published by order of the government, and may be had from the Agent-General of the Colony, Sir Julius Vogel, K. C. M. G., at 7, Westminster Chambers, by Iron Masters and others desirous of obtaining authentic information on the sublect.

FRESH attractions are constantly added to Woodward's Gardens, among which is Prof. Gruber's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

AN ENGINEER, favorably known in the East, desirous of settling in California, seeks position as Superintendent or Chief Draughtsman. Competent to design stationary, marine, locomotive, mill work, sugar and hydraulic machinery. Speaks Spanish. Unexceptional references. Address EXPERT, this office.

KUSTEL'S CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams, 1867. The most complete treatise. Published at this office. Price, $7.50. Postage, 50 cents extra.

HOW TO STOP THIS PAPER.—It is not a herculean task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter*.

EXAMINE the accelerative endowment plan, as originated by the Mutual Benefit Life Insurance Co., of Newark, New Jersey. Assets, $30,533,429.94. Lewis C. Grover, President; L. Spencer Coble, Vice-President; Benjamin C. Miller, Treasurer; Edward A. Strong, Secretary; Bloomfield J. Miller, Actuary. Send for circulars to James Munsell, Jr., agent of insured, 224 Sansome St., San Francisco.

WATSONVILLE, July 29th, 1878,

MESSRS. DEWEY & CO.—*Gents*:—I was not expecting my patent so soon. You certainly kept your word when you said no time would be lost. I remain, yourstruly,

W. T. EASTERDAY.

EXPERIMENTAL MACHINERY, drawings, patterns, models, all kinds of electrical and telegraphic apparatus to order. See ad. F. W. FULLER, 415 Market St., second floor, S. F.

A diversity of semi-tropical and other fruits, corn, vegetables, etc., raised with ease. Address for particulars EDWARD FRISBIE, proprietor of the Reading Ranch, Anderson, Shasta Co., Cal.

A VALUABLE MINING BOOK.

BY J. S. PHILLIPS.

The Explorers', Miners' and Metallurgists' Companion, 682 pages, 83 illustrations. Second Edition. A California publication.

OPINIONS OF THE PRESS.

The book is exactly calculated to suit the views and meet the requirements of those for whom it has been written.—*London Mining Journal.*

The most practical and comprehensive work on mining subjects extant, and valuable book of reference.—*Mining and Scientific Press, San Francisco.*

We know of no work on these subjects in the English language at once so comprehensive, practical and intelligible.—*S. F. Golden Era.*

He has rendered to the leading industry of the coast a valuable service—has furnished the millman and miner a safe and much needed practical guide.—*Overland Monthly.*

This book, which treats in an intelligent and practical way on almost every topic connected with mining pursuits, should be in the hands of every millman, metallurgist, prospector and miner on the Pacific coast. Even the capitalist, and, in fact, every person already engaged in, or likely to become interested in the business of mining, will find in this comprehensive work an amount of information that they cannot afford to dispense with.—*S. F. Commercial Herald.*

This book is free from trash, and solid throughout; all its matter is intelligible to men of ordinary education, and all of it is valuable to miners.—*S. F. Daily Alta.*

In the several sections the work is eminently practical. Is very comprehensive, and contains a great deal of useful information which cannot be obtained from the previous books that have been written on these subjects.—*S. F. Daily Examiner.*

It affords a vast quantity of information as to the appearance and value of different ores.—*S. F. News Letter.*

It is the best single English treatise we know for the use of prospectors and practical miners.—*The Engineering and Mining Journal, New York.*

Sold by Dewey & Co., at this office. Price $10.50.

Engraving. Superior Wood and Metal Engraving, Electrotyping and Stereotyping done at the office of the MINING AND SCIENTIFIC PRESS, San Francisco, at favorable rates. Send stamp for our circular and samples.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Mount Jefferson Milling and Mining Company.

—Location of principal place of business, San Francisco, California. Location of works, Garrote Mining District, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Directors held on the 21st day of March, 1879, an assessment (No. 6) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, Room 6, No. 318 Pine street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 2d day of May, 1879, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Tuesday, the 27th day of May, 1879, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

R. N. VAN BRUNT, Secretary.

Office, Room 6, No. 318 Pine street, San Francisco, Cal.

California and Oregon Land Company.—

Location of principal place of business, San Francisco, California. Location of Works, State of Oregon.

NOTICE.—There is delinquent upon the following described stock, on account of assessment (No. 2) levied on the first day of March, A. D., 1879, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Allen, J O	130	400	$100 00
Pond, E B	120	50	20 00
Woodsum, O P	106	100	40 00
Woodsum, O P	107	100	40 00
Woodsum, O P	108	100	40 00
Woodsum, O P	100	100	40 00

And in accordance with law, and on order of the Board of Directors, made on the first day of March, 1879, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the Company, on Saturday, the tenth day of May, A. D., 1879, at the hour of two o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

R. N. VAN BRUNT, Secretary.

Office, Room 6, No. 318 Pine street, San Francisco.

Cherokee Flat Blue Gravel Company.—

Location of principal place of business, San Francisco, California. Location of Works, Cherokee Flat, Butte County, California.

Notice is hereby given, that at a meeting of the Directors, held on the tenth day of April, A. D., 1879, an assessment (No. 41), of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the company.

Any stock upon which this assessment shall remain unpaid on the twelfth day of May, 1879, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Tuesday, the tenth day of June, A. D., 1879, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

R. N. VAN BRUNT, Secretary.

Office, Room 6, No. 318 Pine street, San Francisco, Cal.

Rocky Point Mining Company.—Location

of principal place of business, San Francisco, California. Location of works, Placer county, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 17th day of April, 1879, an assessment (No. 1) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin to the Secretary, at the office of the Company, No. 314 Bush street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 29th day of May, 1879, will be delinquent, and advertised for sale at auction; and unless payment is made before, will be sold on Monday, the 16th day of June, 1879, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Directors.

T. L. BIBBINS, Secretary.

Office, 314 Bush Street, San Francisco, Cal.

Summit Mining Company.—Location of

Principal place of business, San Francisco, California. Location of works, Mineral Point Mining District, Plumas County, Cal.

Notice.—There are delinquent upon the following described stock, on account of assessment (No. 7,) levied on the 4th day of February, A. D., 1879, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Byers, W T	38	700	35 00
Edwards, J E	39	700	35 00
Cautier, Custave	150	200	10 00
Kellogg, H W	46	1000	50 00
Lehmann, C, Trustee	206	200	10 00
Lehmann, C, Trustee	207	200	10 00
Turner, J W	65	200	10 00
Thompson, R	24	1200	60 00

And in accordance with law, and an order of the Board of Directors, made on the Fourth day of February, A. D., 1879, so many shares of each parcel of such stock as may be necessary, will be sold at public suction, at the office of the company, No. 318 Pine street, Room 6, San Francisco, California, on Tuesday, the Eighth day of April, A. D., 1879, at the hour of three o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

R. N. VAN BRUNT, Sec'y.

Office, Room 6, No. 318 Pine Street, San Francisco, Cal.

POSTPONEMENT.—The sale of delinquent stock of the above named Company is hereby postponed until Tuesday, the Sixth day of May, 1879, at the same hour and place. By order of the Board of Directors.

R. N. VAN BRUNT, Secretary.

Office, Room 6, No. 318 Pine street, San Francisco.

Union Stone Company.—The Regular

Annual meeting of the Union Stone Company of California for an election of a Board of Directors (to act as Trustees) to serve the Company for the ensuing year, and for such other business as may properly come before the meeting, will be held at the office of the Secretary of the Company at 237 First Street, San Francisco, California, on Tuesday, April 8th, 1879, at 11 o'clock A. M.

R. F. KNOX, Secretary.

San Francisco, March 20th, 1879.

The Large Circulation of the MINING AND SCIENTIFIC PRESS extends throughout the mining districts of California, Nevada, Utah, Colorado, Arizona, Idaho, Montana-British Columbia, and to other parts of North and South America. Established in 1860, it has long been the leading Mining Journal of the continent, its varied and reliable contents giving it a character popular with both its reading and advertising patrons.

New Zealand Steel Rails.

TENDERS INVITED.

To Iron-Masters—Wanted—100,000 Tons of Steel Rails, to be Manufactured in New Zealand.

PUBLIC WORKS OFFICE, Wellington, New Zealand, November 6th, 1878.

Written TENDERS will be received at Wellington by the Hon the Minister for Public Works up to the 30th day of September, 1879, for the supply of the whole or any portion of 100,000 tons of STEEL RAILS, to be manufactured within the Colony from New Zealand ores. Payment will be made in cash on delivery at the Works—the government of New Zealand agreeing to pay, in addition, one half of the cost of conveyance to the Colony by sea of the workmen to be engaged in the manufacture.

Information as to the mineral resources of New Zealand, and maps indicating the various localities in which mineral deposits are situated, in relation to means of transport, may be had on application to the Agent-General of New Zealand, 7, Westminster Chambers, Victoria Street, London, or to Walton W Evans, Esq., 66½ Pine street, New York.

As it is unlikely that intending contractors will enter into an engagement of the above nature without first satisfying themselves by personal inspection as to the position and extent of the raw material in New Zealand required for the manufacture of iron, every facility and information on this subject will be afforded on application to Dr. Hector, C. M. G., F. R. S., Director of the Geological Dep't, Wellington.

For the information of parties desiring to tender, it may be stated that the official returns show that there were imported into New Zealand within the last eight years, 15,500 tons of cast-iron, and 93,000 tons of wrought iron, exclusive of iron for government and other railways, during which period 1068 miles have been constructed and opened for traffic.

New Zealand colonists who may have friends and correspondents connected with the iron manufacture are requested to be good enough to draw attention to the highly advantageous and profitable field for enterprise which this Colony presents to those who can bring the necessary capital and practical experience to bear upon such manufacture.

JOHN KNOWLES, Under Secretary for Public Works.

THE SAFETY POWDER COMPANY,

San Francisco, Cal.

CARTRIDGE.

GEN. W. S. ROSECRANS, President.

COL. SAM'L O. GREGORY, Secretary.

Fuse Lighter and Fuse.

Safety Cap and Fuse.

Electric Cap.

Safety Powder, Caps, Electric Caps, and Fuse Lighters.

Under a series of U. S. Patents, after long and carefully conducted experiments and thousands of tests, this Company is prepared to manufacture and supply, for Mining and Engineering Works, the above named articles at prices and on terms as favorable as articles of similar grades are now supplied in this market. Our Powders contain no Nitro-glycerine, no Nitroline, no Gun Cotton, no Fulminates, and are free from the unavoidable dangers in manufacturing transporting, handling and using of all high grade explosives which contain those elements.

Cold does not affect them. They cause no headaches or other inconveniences in handling, and the smoke from their explosion contains no poisoning or sickening vapors.

Their blasting force, with slight tamping, at least equals that of any Powders now used, but they admit and require strong tamping to bring out their immense and peculiar lifting power which follows their detonating work. They should be fired, therefore, by our

Safety Cap,

Which allows tamping without danger. They can be fired by any caps now employed in blasting, but the use of these is always dangerous with any Powder, and the loss of the throwing power resulting from lack of tamping renders it with our Powders doubly objectionable.

Our SAFETY CAPS have twice or thrice the force of triple Giant Caps. When set on fire they do not explode, but merely burn off, and are perfectly safe in transporting and in tamping.

In round tin boxes, 50 cents.

The Safety Fuse Lighter,

Cheap, handy and sure to light the Fuse upon the end of which it is fastened, only needs a trial to be appreciated by every miner who is up to "snuffs." 25 Cents per box; sent by mail.

Safety Fuse,

Equal to the best in the market, will be supplied at the lowest market prices.

In consequence of spurious imitations of

LEA AND PERRINS' SAUCE,

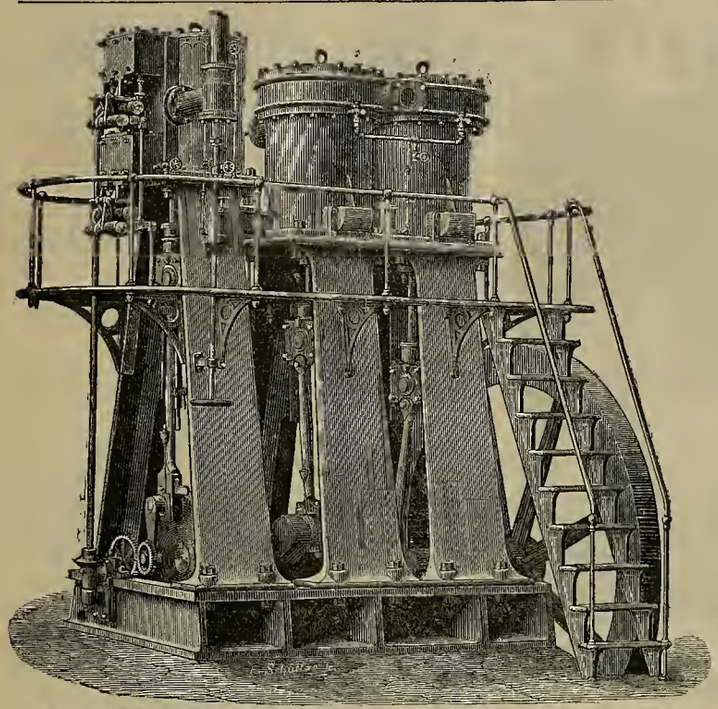
which are calculated to deceive the Public, Lea and Perrins have adopted A NEW LABEL, bearing their Signature, thus,

Lea & Perrins

which is placed on every bottle of WORCESTERSHIRE SAUCE, and without which none is genuine.

Ask for LEA & PERRINS' Sauce, and see Name on Wrapper, Label, Bottle and Stopper. Wholesale and for Export by the Proprietors, Worcester; Crosse and Blackwell, London &c., &c.; and by Grocers and Oilmen throughout the World.

To be obtained of CROSS & CO., San Francisco.



With Adjustable Cut-off Poppet Valve Engine, and Forced Iron Crank Shafts.

Mining Machinery Depot,

PARKE & LACY,

No. 417 Market Street, San Francisco.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

HERCULES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade

PATENTED IN THE UNITED STATES PATENT OFFICE.

THE CALIFORNIA POWDER WORKS,

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and HERCULES Powder.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street, - - - - San Francisco, Cal.

GIANT POWDER

MANUFACTURED UNDER A. NOBEL'S ORIGINAL AND ONLY VALID NITRO-GLYCERINE PATENTS

Nos. ONE, TWO and THREE.

Stronger, Better and Safer than any other High Explosive.

Judson Powder

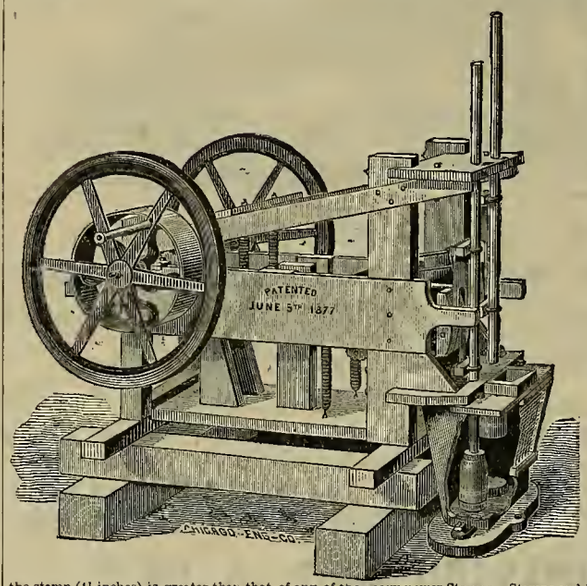
IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.

It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. ☞Triple Force Caps and all Grades of Fuse.

BANDMANN, NIELSEN & CO., San Francisco.

THE POOR MAN'S PROSPECTING

HAND OR POWER QUARTZ STAMP MILL.



Two men can operate it all day. It is simple, efficient and durable. The force of the blow can be changed so as to strike a light or a very heavy blow readily. Two men can work this Mill to its full capacity, and do the work as well as can be done with any of the old-style heavy Stamp Mills. An inspection of this Machine will convince any practical person that it is the most perfect QUARTZ STAMP MILL ever produced in this or any other country. A large number of old practical Miners have seen it, and they all say it is a perfect Hand Stamp Mill. We put on a band pulley, so it can be run with power. The cut is a correct representation of C. EATON'S Patent LATELY PERFECTED MILL.

— FOR —

PROSPECTING

IT IS SIMPLY

Perfection!

When power is used, each Stamp will strike 150 blows per minute. The force of the blow in comparison to the face of the stamp (4½ inches) is greater than that of any of the heavy power Stamps. Stamps and Dies cast on Chill. These Machines are well and thoroughly made, nothing about them to get out of order. They are put together with bolts. Can be taken apart readily, so as to be convenient to pack on a mule's back. The whole machine weighs about 1,300 pounds. The heaviest piece weighs 200 lbs. These Mills will do more work (according to money invested) than any of the old heavy Stamp Mills. For sale at AMES' STEAM ENGINE DEPOT, 14 S. Canal street, Chicago, Illinois. Net Cash Price, $150.

COLLINS EATON.

VULCAN BLASTING POWDER.

The strongest and most economical explosive in use.

Wherever it has been given a test, it has surpassed all other high explosives.

Works at SAN PABLO, California, and RENO, Nevada. | **Office,** No. 123 California Street, SAN FRANCISCO.

CARDNERS'

Celebrated

Governor

These Steam Governors have long been known as THE BEST, and as lately Improved and Perfected, they have no Rival.

THE SAFETY STOP

On these Governors is alone worth double the price of the Governor. We have sold over six hundred, and

Never one has Failed.

They are sold at the same price (or less) as ordinary Governors. Send for Circular.

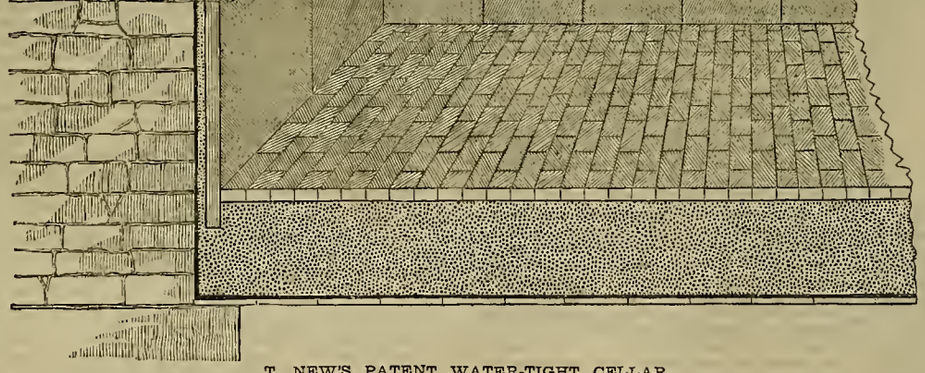
Waterproof Cellars.

It is not enough to have pure air and pure water in the house we live or do business in, but it is equally necessary that the health of the occupant should be looked after by having perfect ventilation, heating and drainage. Were it not for the trade-winds that blow in from the ocean during the summer months that carry away the exhalations arising from imperfect sewerage of this city, our death rate would be largely increased. We have another source of evil in the exhalations arising from damp and wet cellars in that part of the city extending up from the water front to a line of Sansome street, and extending south across Market street, which has been filled in above water level with the sand taken from the sand hills in leveling. The cellars of the buildings erected on this "made land" are not, in most cases, of sufficient depth for business purposes; that is, on the part furthest away from the bay. Those nearest the bay scarcely admit of standing room, and the buildings on the water front have no cellars at all.

The buildings on Market street, near Main, have basements about five feet six inches in depth, while those on Market and First or Davis are but six feet high in the clear; the depth increases as we approach Sansome street. The noxious exhalations arising from the stagnant waters directly beneath the floors when the floors are made just above the water level and with only a film of asphaltum for covering, renders these apartments damp, and the asphaltum does not seal the exhalations like an impervious coating.

Not only that, but in many cases the property is deprived of valuable business room by not having sufficient light of story for a proper business apartment. Mr. Tobias New, of New York city, has invented a valuable device for remedying these evils by which any of these basements may be made as dry as possible, and useful for the sale of the finest dry-goods. They are entirely free from damp and moisture, even when the basement floor is six feet below the water level. With a construction of this character all the basements on the city front could be made available for business purposes.



T. NEW'S PATENT WATER-TIGHT CELLAR.

In all methods of making water-tight cellars heretofore, the inventors have had to depend on a waterproof lining of impervious materials, the pressure of the water being counterbalanced by weight being placed on the floor. It is evident that in cases where the water was deep and the foundation of the building was not sufficiently deep to allow the excavation necessary to contain the required load or weight to counterbalance the great depth of water, it would be impossible to get the necessary amount of head room; and the lower down the waterproof lining is placed the greater becomes the weight of masonry. The great desideratum has been to get some kind of construction that should offer the required resistance to counterbalance the upward pressure of water, and still occupy a minimum depth, so that by keeping as near the surface of the cellar as possible, or by stopping the water at as high a level as possible, there would be less weight of water to overcome, and of course, a proportionally less excavation and less cost of construction.

The waterproof layer is placed on the inner sides of the cellar wall shown in the engraving. The inner wall is constructed of flagstones or other suitable material of sufficient strength to resist any expected pressure from without. The floor is made smooth, with either concrete or lumber, and the waterproof lining is applied, extending also along the perpendicular walls to a sufficient hight to be above the greatest rise of water. A layer of concrete is next applied on the waterproof lining and then, across the cellar, tie rods are placed of sufficient number and strength, when combined with the weight of concrete, to resist the upward pressure of the water. The flagstones will be anchored at the top and backed up with concrete, so that the tie rods are held rigidly in their places and prevented from rising when strain is brought upon them by the upward pressure of the water. To complete the bottom and form the floor for storing merchandise or other uses, and to prevent the flagstones from being forced inward by the pressure of water and the strain of the tie rods, the latter are covered with another layer of concrete or artificial stone, or, if preferred, with a compact layer of brick or tiling. It is evident that by this construction a flat arch or truss is formed in the bottom, of great strength and sufficient to counterbalance with six or eight inches, four to six feet depth of water. The concrete below the tie rod is made to resist the upward pressure, tending to crown the floor and the tie rods, re-enforce the same by their tensile resistance, preventing an arching of the structure. The effect of the upward or lifting pressure of the water will be to bring the strain on the tie rods, and before the floor can be lifted the rods must break or the artificial stone must crush. It has been learned by actual experiment that the same amount of water can be counterbalanced by about one-third the thickness of construction now required; consequently two-thirds of the thickness of floor is saved and an equal amount of excavation.

With this construction, cellars can be made dry below tide water; and cellars now full of water may be made dry enough for the storage of silk. Cellars now unfit for use, and that cannot be rented for any price, can be made as dry as any room in the building, and when so fixed can be used for any purpose. In many cases the rent for the first year will pay for the work in making the necessary alteration.

P. H. Jackson & Co., No. 2 California street, in this city, are agents for the new patent cellar. They are also manufacturers and licensees for Pacific coast of Hyatt's patent vault lights and illuminating tiles, and Hyatt's patent basement extension roof. They will give any desired further information on the subject.

THEY have three mining academies, in Austria, for the education of engineers and officers in the higher branches of the business, and six schools for affording workmen such instructions as they most require.

DURING the three months ending March 31st, there were 2,523 failures in the United States and Territories, with liabilities amounting to $43,112,665.

NAPA county is manufacturing olive oil.

AN UNFORTUNATE CLASS OF INVESTORS.—That English mine investors should have become discouraged not to say disgusted with their experience on this coast, is not to be wondered at. With few exceptions their investments whether made in stocks, mines, tunnel or other schemes, have turned out badly. Whatever they have been concerned in has been attended with disappointment and failure. They had only to touch a living thing and it died. And yet they do not seem to have acted precipitately in making these investments. They neglected none of the usual precautions and overlooked none of the safeguards that are considered essential to success. On the contrary they appear to have acted with prudence—coolly, deliberately, with all that business acumen and commercial sagacity for which they are proverbial. They consulted what were deemed intelligent and reliable sources of information in regard to our mines; they employed competent experts to examine them; they came and looked at them themselves; and, finally, having purchased these properties and raised sufficiency of working capital, placed them under a capable supervision, and awaited results, which, in nine cases out of ten, have come only in the shape of disappointment, vexation and loss. It may well be asked how this has happened! There is something phenomenal about it. It is inexplicable! We cannot account for it, and allude to the fact because of its strangeness, and in the hope that some one, being especially informed touching the causes of these failures, so general and almost uniform, if any such there be, will vouchsafe to give the public the benefit of his knowledge.

THE LICK OBSERVATORY.—Mount Hamilton was long ago selected by the trustees of the Lick Trust as the most elegible site in the State for the location of the observatory projected by the late James Lick, and for which he provided the sum of $700.000. But the mountain has three peaks—Observatory peak, 4,302 feet high; East peak, 4,448 feet; and Middle peak, 4,318 feet, and on which of these the observatory is to be erected has never as yet been decided. Late Eastern dispatches state that on the recommendation of Prof. Newcomb, of the Washington observatory, Mr. S. W. Burnham, a Chicago lawyer and astronomer of some distinction, has been appointed by the trustees to make this selection, and he will at once proceed to carefully test their comparative suitableness, with a view to its definite location and immediate erection.

THE silver question is rapidly coming to the front in England.

Extending the Scale of Vein Mining Operations.

Prof. J. E. Clayton, now of Salt Lake, formerly a resident of California, has been discussing of late, both through the press and before the Bullion club and other financial organizations in New York, the manner in which mining enterprises should be undertaken and carried on, this gentleman contending that mining for the precious metals is not only a legitimate but a highly useful industry, and, when properly pursued, as little risky and as certain in its results as any other. In some remarks recently made by Prof. Clayton before the New York Bullion club, he advocated the policy of forming companies with enough capital to purchase entire groups of mines or even whole mining districts, as one that, by reason of the large scale on which the business could be prosecuted, would reduce the hazards to a minimum, while the chances for profit would be increased in a like ratio, instances being cited in which this plan would be especially applicable. Where, for example, the veins are small but numerous, a large success can be gained in no other way. In localities of this kind, if care is taken to find out the position of the largest and best bunches of ore, extensive reduction works may be kept in steady operation, even in districts where there are lodes of only the smallest size.

Prof. Clayton then indicated certain rules that would aid the mine explorer in locating the more valuable ore deposits in a district, such as a careful examination of the geology; also, a close inspection of the outcrop of each lode, with a view to ascertaining the length of any ore bodies that might appear on the surface, a thorough test of the ore being meantime made; the surface ore will, as a general rule, be found to indicate the average value of that met with for several hundred feet below. This is work that should be faithfully performed preliminary to anything being done underground. In entering upon this, it is of the first importance that the shafts put down and the levels run are in the proper places with reference to the outcrops and ore chutes. The pitch of the latter should be noted, so they can be opened with as little dead work as possible, and the depth at which they will be likely to pass the end lines of the locator's claim and enter that adjoining, be ascertained. Generally the pitch of an ore chute can be determined before opening up the latter to any great depth, such pitch being denoted pretty accurately by the structure of the lode and the *striæ* or grooves on its walls, these lines of movement being always present in true veins.

When a number of the principal lodes in a district have been opened up to a considerable depth, the results afford a clue to the probable value of the other lodes in the neighborhood. The danger of putting up too large reduction works is one to be guarded against. A mine should have ore enough in the reserves to repay the purchase money and put up mills at the very start, a two years' stock being afterwards always kept in sight.

NO BOTTOM TO IT.—We have the authority of Prof. Frank Stewart for saying that there is not a permanent, mineralized vein in the entire Leadville district. They have there nothing but argentiferous lead ores, which almost invariably occur in shallow beds and limited chambers. Hence the danger that the bitter experiences of White Pine will find repetition in these much talked of Colorado mines.

THE President has set aside a large reservation in Washington Territory for Chief Moses and his tribe.

Silver with the Gold.

[Written for the PRESS by A. B. PAUL.]

Whenever anyone refers to mining in the State of Nevada, silver, as the metal worked for, is inferred, and when such reference is made to California, gold is implisd; all arising from the fact that the first State mentioned is celebrated for its production of silver and the latter for its gold. I do not say this is strictly incorrect, and yet in ons sense it is, as each State produces hoth silver and gold. There are two facts, however, to hs considered in connection with this matter; first, milling in Nevada is so superior in its systems of amalgamating, that if ores contain gold they get there a hetter per cent. of it than is done in California. The other fact is that where silver is associated with the gold in the California ores, the system hy which the gold is here undertaken to he saved, viz: hy the use of stamps, copper plates and hlankets, precludes the possihility of saving the eilver. Owing to this latter fact, the opinion generally prevails that in California the "gold leade" do not carry silver. Now, I can assure those who entertain this idea that if they will make trial of 100 of the "gold mines" of this State, that 75 of them will be found to carry enough silver to pay all the expenses of extraction and reduction, provided their mille are so constructed and operated as to save this metal as well as the gold. Several years ago I made extended experiments with this class of ores and here present some of the results ohtained, and which I happen to have at hand.

Assay on five lots of *tailing*, from different places, went as follows:

	Gold.	Silver.
No. 1	10.04	3.14
No. 2	5.02	3.93
No. 3	13.55	9.28
No. 4	12.06	4.90
No. 5	4.13	6.77

From the ahove it will be seen that the average of tbese five tests was $8.96 gold, and $5.01 silver.

Two tests of concentrations went as follows:

	Gold.	Silver.
No. 1	81.40	35.06
No. 2	56.00	33.00

Showing that concentrations carry a goodly quantity of silver, all of which ie lost.

One tells us, when we speak of losing gold by hattery working, that he gets all lost in his eulphurets, which he works hy chlorination. He may in this way get a fair percentage of the gold, hut at the loss of all the silver; and this is a serious loss, if those who chlorinate will only examine *before roasting*.

Some years ago a compilation of assays made by United States assayers of per cent. of gold and eilver in tbe various mines of this State was made hy Mr. Hanks, the results of which fully establishes my position, the statement in percentage being as follows:

	Gold.	Silver.
No. 1	76.86	20.67
No. 2	86.57	12.33
No. 3	86.87	12.33
No. 4	88.75	8.88
No. 5	89.10	10.50
No. 6	89.61	10.05
No. 7	90.01	9.01
No. 8	90.38	6.80
No. 9	90.70	8.88
No. 10	90.90	8.70
No. 11	90.96	9.04
No. 12	94.00	7.00
No. 13	92.70	6.90
No. 14	93.53	6.47
No. 15	96.42	3.50

The average of the ahove tests is $89.68 gold, and $9.41 eilver. This ought to lead to investigation hy our gold miners, that they may ascertain how much silver their oree contain; for, while some may carry 20% or 30% silver, others may not carry enough to make the saving an ohject. From the foregoing it will he seen that when I deride the mode of amalgamating the precious metals generally adopted in California, I have good reason for so doing, my opinion heing founded on investigation, not mere guess work.

Crushing rock seeme to he the great ohject with California millmen—not saving the metal—make sure to get so many tons of rock through, and everything else is satisfactory, till they come to clean up, when tbere is surprise and disappointment. Crushing machiuery has been brought to perfection here.

No where else have they more powerful machinery or greater completeness of mechanical detail. But reducing ore is one thing, and proper amalgamation of the precions metals is another. Now if our ores contain say $5 a ton in silver, why not save a proper percentage of it? This would in some mills pay all expenses, and leave the gold product clear profit. Times are hard, men work for even a dollar a day, and yet there is waste enough going on in our California mills to *more than equal the present product*. If every mill in the State was used simply as a crushing machine, taking up what can he secured on copper plates, and the old Mexican arastras were put in bclow, it wonld, in my opinion, make a difference of $10,000,000 per annum in the bullion product of the State. With no other change than this, there would he euccess in scores of cases where now is only failure. In fact, failure in this State is only another name for inexcusahle waete.

In view of the past, one would he almost lead to helieve that a premium had heen offered for a device hy which the largest amount of the precious metals could he run off and lost, and that our California millmen had secured the bonus.

Papago Country.

For the past few years the *Arizona Sentinel* has heen industriously calling puhlic attention to that part of Arizona lying south of the Gila and west of the Santa Cruz, known as the Papago country. Few men traveling along the levsl deserts hordering the Gila have been ahle to comprehend that 40 miles south of that stream, and along the Sonora houndary, extends a far more attractive country; whose mountains are not altogether of lava, and whose valleys are watered hy a rainfall heavy enough to clothe them with grass and trees, and to enable the Papago Indians to raise crops of cereals and vegetahles without irrigation; to understand that its geological formation is highly favorahle to the existence of hig and rich mines of silver, copper, lead, and antimony. The persistence of their assertions has led to vigorous prospecting down in that section, and to the discovery of great mines, to which value is now heing given by construction of the Southern Pacific railroad. These mines are already attracting the attention of Eastern capitalists. Fourteen of them have recently heen honded for New York parties hy Mr. George Tyng, at $175,000. The figure is large, but the property gives reasonahle promise of heing worth it. These mines include the Gunsing group, which has already attracted some attention hy shipment of ores, which pulped from $400 to nearly $3,000 per ton. Though these mines have heen considerahly overrated, they certainly are large, etrong veins, cropping boldly for distances of eeveral hundred feet, and to widths of 10 to 40 feet. They carry a large proportion of lead, whose decomposed forms attract and deceive tbe unpracticed eye; hut they also carry rich seams of silver ore, sprinkled with particles of horn silver and wax cblorides, ahout which there can he no mistake. Mr. Tyng has sent to San Francisco for an ample etock of tools and supplies, and the true character of these great veins ie likely to be determined within a few months. It is to he hoped the result will be satisfactory, as this will lead to rapid development of many large and promising mines in the vicinity.

At first eight there appears to be a scarcity of water, but careful examination of the country must convince anyone that plenty of water can be found by wells of moderate depth. The rainfall ie considerahle; the washes and gulches made hy surface drainage do not indicate the flowing away of masses of water proportionate to the area of country drained; the eoil, and much of the bedrock, is porous; the natural inference is that its water seeps away very slowly through underground channels, or is retained by cross-dykes. This theory is supported hy the result of the few wells that have heen dug down there.

EUREKA MINING PRODUCT.—Within a radius of five miles of the town of Eureka, there are at the present time 70 producing mines, yielding in the neighhorhood of 700 tons of ore per day. The amount of ore extracted varies from 200 tons apiece, as at the Eureka Con. and Richmond, to a few hundred pounds picked out hy chloriders in the less famous properties. Some of this ore is very rich and will assay up into the hundreds, and none extracted will work less than an average of $50 per ton, and it can he safely estimated that the regular daily yield of the district will reach $35,000. Not all of this output goes directly to the furnaces, as, in the case of the emaller mines, it is stored upon the dumps until it accumulates in sufficient quantities to warrant a shipment. In some instances as much as 300 tons have heen hoisted out and stored away, waiting for roads and trails to hecome eolid, and this ore will he sent to the smelting works next month. On Prospect mountain the rock hae to he transported hy mule trains, a tedious and costly method, and one that forhids the utilizing of any except a very high grade, and it is a notorious fact that thousands of tons of second-class rock have heen exposed in the shafts and levels of Prospect Mountain claims that would pay a handsome profit for working, if there were good wagon roade leading to the apex of the mountain.—*Eureka Leader.*

THE BIG TREES OF CALIFORNIA.—Prof. Brewer points out two errors that are current about them, one relating to their hight, and the other to their age. The "Father of the Forest" is generally said to have been 450 feet high when in hie glory. The fact is, no one knows how high it was. When the grove was first seen hy white men, the prostrate tree was already part rotten, and the whole top hurned away. The highest tree in the Calaveras grove is 225 feet, and the highest in the Mariposa 272 feet. The highest in the Kings River grove is 300 feet. As to their age, their is no reason to helieve that even the eldest hegan its growth "long hefere David reigned in Israel," as people are fond of asserting. One of these trees was felled in 1853, and found to be sound to the core. Its age is known to within a few years, and it hegan its growth more than 2,500 years after David died. It is possihle that some of the oldest trees of this speciee may have hegun its growth 2,000 years ago, hut not at all prohable that any reached hack to within a thousand years of the time of the Jewish king.—*Silver State.*

A Monster Locomotive.

Uncle Dick weighs sixty-five tons, and he is sixty feet long from his head light to the rear end of his tsnder. He is the higgest locomotive in the world, and has just been turned out of ths Baldwin locomotive works for duty on the precipitious inclines of the Atchison, Topeka and Santa Fe railroad. A hoiler 21 fect long supplies steam for cylinders 20 inches 26, and gives motion to eight 42-inch drivers, while a large tank surmounting the entire structure not only carries a water supply, hut helps to give Uncle Dick a tighter grip on the rails. His driver will have control of three independent systems of air brakes, and can hring to hear at once upon his wheels a restraining force of 75 tons, which is none too large, inasmuch as a "shoe pressure" of 50,000 pounds is required to keep him, when standing still and alone on the steep road over the Ruton pass, from surrendering to gravitation and rushing down hill hy his own weight. How heavy these grades are can he underetood when it is noted that one end of Uncle Dick will often stand more than three feet higher than the other, so that in traveling his own length he will do the work of lifting ahout 250 tons a perpendicular foot. And yet thie moneter, rejoicing in his etrength, will rush up the flank of the Rocky mountains with ten loaded cars hehind him.—*Denver Tribune.*

THE BODIE PLACERS.—The excitement over our placer mines, saye the Bodie *News*, continues to increase. All are anxious to get in. Over 100 shafts have heen commenced; all that sunk to the gravel got first-rate prospects. The great difficulty in sinking is the water struck after sinking 6 or 10 feet, which will require pumps to free them so they can he worked to advantage. John Cullen and his company have the richest claim so far as opened; they find some of the richest quality of quartz that fairly sparkles with gold, others with seams of gold running through it. This will surely lead to the thorough development of the whole canyon and flat, with the almost certain probahility of finding some rich ledges. Already has ground heen taken up for quartz mining. This, of course, does not interfere with the claimante of placer mines. There are more prospective millionaires to-day, in Bodie, than any other town in the State. The shrcwd ones are on the alert to locate or snap up any claime offered for sale. The prospects are that 1,000 men will be at work in these placer minee within a month, especially if water is furnished to work them. Still we would not advise miners from other parts to come here as we have all the labor required.

COAL IN IDAHO.—The Silver City *Avalanche* saye that a 12-foot vein of coal was discovered in the vicinity of Sinker creek. Indicatione of its existence were discovered there a long time ago hy Judge Tutt and others, and within a few days he and W. H. Cooper, James Lyman, John Grete and P. Brennan, located the ground and put a small force of men at work einking pits. At the depth of six feet from the surface it has been tested hy hlacksmiths with very favorahle results, revealing a considerable portion of material for fuel in its composition. The light which comes from it ehows considerahle gas, and it is expected that the quality will improve as the descent progresses. If it should turn out to he the genuine article, and there are etrong indications that it is, it will he a hig thing for the country. There can he no douht that hoth coal and iron exist in abundance in various parts of Idaho, and that these, as well as many other of our great resources, have not heen touched as yet. Gold and eilver are not the only treasures that are hidden within these vast ranges of mountains.

WATER CONSUMPTION.—The quantity of water now heing consumed hy the Southern Pacific Railroad Company, at its construction front, is prodigous. Eight huge water-tanks are daily hauled out to the front. No water is now sold hy the company at Gila Bend. All that used hy outsiders there hae to he hauled on wagons from the Gila river, four miles distant. An additional line of pipes has heen laid from water-works to the tank at Yuma. The pumping engine is kept at work till a late hour at night. The new water-works at Texas Hill are progressing well; and will soon afford some relief to those here, the tanks are all set up and the pipe is nearly laid. The water is to be pumped up into a reservoir on a bluff near the river, from which it will flow through five miles of pipe into the tanks at Texas Hill. An artesian well is heing hored for the S. P. R. R., out on the California desert, hy a company of Chicago men, who have the finest outfit of horing tools ever hrought to this coast. Their derrick is eighty feet high. They are making good progress.

ARIZONA RAILROAD IRON.—For some time, large quantities of railroad iron have heen going through for the extension of the Southern Pacific railroad in Arizona. Hundreds of tons pass through almost every day. In the last month at least 2,000 or 3,000 tons must have gone through, and more continues to come every day. This would indicate a determination on the part of the Southern Pacific managers to push their road East very rapidly this summer. The prohahilities are that the heart of Arizona will he pierced hy a railroad inside of a year. This railroad company are not buying this iron to let it lie in idleness.—*Reno Gazette.*

The Geology of the Leadville Carbonates.

Prof. Weiser writes to the Georgetown (Colorado) *Courier* the following statement of his investigations and conclusions:

The carhonate field of Leadvills is at this time attracting more puhlic attention than any other mineral locality in the world. Scientific men everywhere are anxious to know something ahout the formation of this extraordinary locality. I havs heen engaged for soms days examining the geology of this field, and although the snow has prevented ms from making a thorough examination, yet I have seen enough to satisfy my own mind that the whole territory of California gulch, with all its lateral hranches, swells and hills, helongs to the cenozoic time and in the lower eocene of the tertiary, with the lignitic of the cenozoic just helow it, and the upper cretaceous of the mesozoic just helow that. Between the main range of the Rocky mountains, and one of the large eastern spurs, there was at one time, prohahly hefore the glacial age, a large fresh water lake, the waters of which held in solution carhonate of lime, lead, silver, gold, and iron. These minerals in the oourse of long ages were slowly precipitated to the hottom of this lake. Ages after this precipitation, and perhaps after this lake had become drained, the internal oscillation of the earth, occasioned by the motions of the liquid material of the earth, threw up the hills and swells as we now see them. The whole territory once covered hy this mountain-lake must, therefore, contain a deposit of the precious metals, together with lead, iron, lime and silica. This is my theory on the formation of the carhonate fields. I am aware that eome scientiste reject the theory of precipitation from solution in water, hut I think the majority of most advanced geologists have agreed that mineral may all have heen precipitated in water, and after its precipitation may have been disturhed hy igneous action. This is the opinion of Prof. Von Cotta in his great work on "Ore Deposits." Prof. Newhury, in "Appleton's Encyclopædia," in the article on "Mineral Deposits," also admite the water deposit. (See his article.)

The superposition of tbe carhonate, as far as my ohservations extend, is ahout as follows:

First—There is a post-glacial deposit of from 6 to 150 feet, for it eeems to vary in differcnt localities, but there is as yet not data enough to determine anything about the depth of tbis deposit.

Second—An anti-glacial deposit consisting of half-rounded houldere and gravel of from 4 to 10 feet in thickness.

Third—A deposit of calcite (here called porphyry) several feet thick. This stratum is looked upon hy prospectors as a good indication: it seems to vary very much in thickness—from a mere trace to several feet.

Fourth—An iron hand, in some places many feet thick and at others also a mere trace. This iron stratum lies on the mineral eratum, so that as soon as iron is etruck, which ie here called the point of contact, the miner knows that the mineral belt is near at band.

This mineral helt is sometimes very large, *i. e.*, wide and thick. I do not know that anything very definite has yet heen determined as to the full extent of this helt. The opinion is largely entertained here that the mineral helt is found in wavy undulations, hecause the mineral is found at some points much nearer the surface than at others. These undulations were evidently formed soon after, or prohahly hefore the lake was drained, and were caused hy the internal oscillatione of the earth, the same forces that threw up at an earlier period the Rocky mountains.

In regard to the quantity of the mineral, which is an argentiferous carbonate of lead, we have not as yet sufficient data to come to any definite conclusion, hnt from the developments thus far made the quantity must he immense. Thns at one point the mineral etratum has heen penetrated to the depth of over 40 feet, and at other points it may he even thicker. Now suppose we hase our calculation on the quantity of mineral, upon a single mine site, which in Lake county is 1,500x300 feet, it would give ahout 250,000 tons to each acre, and as there are 10 acres to each claim, we have 2,500,000 tons in a single mine; and as there are hundreds of mines already located and hundreds more to locate, some idea of the quantity of mineral here may he formed. The territory over which this carhonate field extends mayhe 30 miles long and 6 wide, making an area of 115,000 acres. When will such a field be exhausted? Verily, this is a wonderful country, the like of which the world has never seen.

CAPT. BOYNTON'S RUBBER SUIT.—The ruhher life-saving dress is in two parts, tunic and pantaloons. The latter contains an air chamher in each leg, which extends to the tops of the hoots, while the waist is girdled with a resisting steel hand, on which is mounted a flange or ridge of heavy rubher. The jointure is made hy lapping the tunic over the hand, and a similar ridge drops into the groove formed. A helt thrown over the whole makee a perfectly tight joint. The tunic contains three air chambers; one in the hreast, hack and head. When the latter chamher is inflated through the tuhe, it forms an excellent pillow, raising the head of the occnpant sufficiently to give him a complete range of vision. The suit is of most delicate construction, and yet it will resist the most terrihle breakers and seas. The face ie the only portion of the hody exposed, and this accounts for ths hronzed features of the famoue navigator.—*Cincinnati Commercial.*

MECHANICAL PROGRESS.

Improvements in Iron Production.

The grand fact in the history of iron for the last 20 years bas been the gradual hut pretty rapid substitution of the softer varieties of steel to a very large extent for wrought iron. The earlier experiments of Bessemer and some others who worked at about the samo time, were directed to the production of this latter material by a quicker and easier process than "puddling" for the removal nf the carbon of cast iron. These experiments were unsuccessful so far as the complete removal of carbou and production of thoroughly soft, pure iron was concerned; bnt they proved the feasibility of manufacturing steel diroctly from cast iron with far less expenditure of time, fuel and labor than older methods, snch as "cementation," involved, in which carbon had first to he removed, producing wrought iron, and subsequently added again slowly and in restricted amount. The new processes, moreover, carried with them the great advantage of nperation at so high a temperature that tho metal was completely fused, aud hence much more uniform in character than when masses were consolidated hy welding only from parts varying in the amount of carbon, and hence in physical properties, and retaining also in the case of bar iron more nr less romains of slag.

It did not take long to show that these characteristically new processes were not destined to replace the older ones for tho manufacture of wrought iron, properly so-called, but it was not so quickly perceived that neither were they fitted for the production of the best steel, of sucb kinds as the name had previously been most connected with, and for such uses as it had previously been most largely applied to. Gradually it became apparent that the true function of the newly invented methods was mainly the production of a new material, ontaining carbon in relatively small amount, combining the toughness and workable qualities of wrought iron with the great tensile strength, rigidity, some of the hardness, and especially the homogeneity due to practicable fusibility, of eteel. The "mild eteel" which is the essential result of the recent processes of manufacture, is not the "tool steel" which, not many years ago, was pictured in every one's mind in connection with the name steel, but it is a substance available for a far wider range of uses and applicable upon a far greater scale.

Of the various individual processes which have been proposed and tried for the rapid production of mild steel, decidedly the most successful have been those of Bessemer and Siemens; the former consisting essentially in forcing a blast of air nnder high pressure into molten cast iron in a suitahle "converting vessel," thus rapidly burning out the carbon and silicon, mixing with the fluid metal a determined amount of separately fused cast iron containing a known amount of carbon, and casting the product into ingot molds; while the latter brings into play the admirable peculiarities of the gas furnace, by fusing together at the extremely high temperature which it affords, and in the entirely controllahle chemical atmoephere of its hearth, pig iron and scrap wrought iron, as suggested hy Martin, or pig iron and iron ore (an oxide) on the plan of Uchatius, hut on a much greater scale in either case, so apportioning the carhon and iron left together in the fused product that steel of the required character shall be obtained. In a sense it may he said that the invention of Siemens, leading to the manufacture of "Siemens-Martin" and "Landon-Siemens" steel, has supplemented the Bessemer converter, and hy providing a way for profitahly using up vast etores of old wrought iron already on hand, has permitted the more rapid substitution of eteel manufactured by both methods. By these two processes, within the last two or three years an annual product of more than 2,500,000 tons for the world at large hae been turned out.

During the period in which so much attention has been concentrated upon steel, much has been learned in refereuce to the effect in its production and upon its properties of even very small quantities of other elements than iron, though much still remains to be ascertained in thie direction. The most important points which have been ascertained are those in regard to the benefit derivable in the manufacture, particularly of Bessemer steel, from the presence in the iron of manganese and silicon, tbe chief function of the former being the removal, to some extent, of sulphur, phosphorue and oxygen, which, if allowed to remain, greatly impair the mechanical excellence of the product, while they exhibit a stronger tendency to combine with manganese than with iron, and thue get carried off into the slag; eilicon, on the other hand, aiding by its combustion to keep up the high temperature in the converter which maintains the fluidity of the metal, and uniting, when hurned, with the hasic oxides to form and eeparate from the metal a removahle form of fluid elag. The observed benefit arising from the preeence of theee two euhstancee has stimulated the production, for use in connection with ateel-making, of cast iron rich iu eilicon, of crystalline "epiegel-eieen," containing a large and uniform amount of carhon along with manganeee, and lately of alloye of iron and manganese—the so-called ferro-manganese—containing, as in tbe product of the French Terro-Noire works, up to 65%, and even 85% of the latter metal.

Another point, and of unexpected character, has but lately been ascertained—namely, that if the percentage of carbon in steel be reduced, phosphorus may bo admitted to an extent which would be seriously injurious if the normal amount of carbon for the kind of steel required had been present. Some remarkablo specimens of steel from works ou the Siemens-Martin plan, iu New Jersey, in the possession nf tho writer, illustrate this distinctly.

Notwithstanding the numorous attempts, too often reported on by interested parties, to produce valuable alloyed forms of iron or steol by additiou of other metals, most of which attempts have led to no permanent results of real importance, it remains much to be desired that a systematic examination should bo made by impartial hands of the alloys of iron, with and without the presence of carbon, trustworthy analyscs being made of the products, and at the same time their physical charactere submitted to well-defined tests. Up to this time the only two of the more refractory metals which seem to have proved themselves capable of influencing in any useful way the properties of steel, are tungsteu and chromium, which give hardness, accompanied, however, by iucreased brittleness. The increase of retentive capacity for magnetism which tungsten is reported as producing, may perhaps prove valuahle in the construction of dynamo-electric machiues.—*American Chemical Journal.*

Hahn's Iron Scaffolding.

Mr. Max Hahn has inveuted a new scaffolding composed of iron pipes, which no doubt is superior iu many respects to the old wooden scaffoldings usually erected for huilding purposes. The number of accidents arising annually from iusecure scaffolds is yet very large, and this circumstance alone would make the general adoption of iron as a material for ecaffoldiugs advisable. But there are yet other advantages connected with this invention. The new scaffolding is easily transported, pnt together and taken apart; when not in use it takee up but very little room; it is very cheap, as it is almost indestructible. Besides, it does not hide the building from view, but permits a free inspection of the progress of the work.

The scaffolding cousists of two rows of four-inch iron pipes, sunk about three feet into the ground and resting on piecee of hoard. They are provided with sockets, at regular intervals, which take up the horizontal pipes, which are three inches thick. They are firmly connected by cyliudrical couplings, consisting of pieces of pipe strengthened at the ends hy riugs of wrought iron and fastened by screws.

The horizontal pipes are provided with holders receiving tbe puttocks, which are lastly placed in position. The thicknesses of the pipes varies for each story. While for the lower story four-inch pipes are used, those used for the fifth story only measure three inches. Two men can easily put up the entire scaffolding in lese than a day. The area of cross section of the pipes may he one-third smaller than that of timber of correspending etrength, or allowing the same dimensions, the strength and safety will be increased 33%.

A New Railroad Tie.—At the regular monthly meeting of the Eogineere' Club of Philadelphia, a model of an iron railroad tie, which is being tried on the Philadelphia & Baltimore Central railroad, was exhibited. The device dispenses with all spikes, bolts, nuts or fish plates, and drilling or punching the rails, avoiding fractures from such causes. The iron tie, it is claimed, will outlast 12 renewals of the ordinary tie at one-half the cost to keep in repair. Each tie is recessed under its rails, and along the bottom of the recess wedge-shaped pieces are cast transversely. At the sides of each recess are creosoted hlocks, which form a cushion and a fulcrum for two clamps, which grasp the flange and weh of the rail above, hearing upon opposite faces of the wedge below. The weight of the train forces the clamps upon the wedge, epreads them at the bottom and grips the rail. The first cost is eomewhat greater than the wooden tie, hut it is said to offset this in durability.

Case-Hardening Iron.—In order to economize in the more expensive materials for case-hardening cast, wrought or malleable iron, and to harden only portions of the article in different degrees, if required, Mr. Gracie S. Roberts, of Brooklyn, England, makes uee of an improved method. After polishing the eurface, he gluee to the portions to be case-hardened a coating of yellow prusaiate of potash. A number of coats are given, according to the degree of the case-hardening required. A cheaper material or simply honehlack is used where a eligbt effect only is required. When the glue is eet hard, the article is packed in powdered charcoal, heated to redness in a quick fire and maintained at that heat for half an hour. Then it is hardened and tempered in the usual manner.

Steel and iron raile have become nearly of the eame price in Europe. At a recent letting in Belgium, the loweet price at which iron was offered, was hut $2 per ton less than for steel, and the great Cockerill Worke of Seraing bid the eame price ($26.25 per ton) for iron and for eteel, heing the loweet bidder for eteel. Very little difference is made in England aleo, and it ie probable that really good iron rails would coet just as much as eteel.

SCIENTIFIC PROGRESS.

A New Instrument for the Mineral Analyst.—At a recent meeting of the Philadelphia Acadomy of Natural Sciencies, Prnf. Kœuig, of the Uuiversity of Peuusylvania, exhibited wbat he calls a chromometer (or color-measurer), a now instrument be has designed for mekiug exquisitely delicate determinations of the presecuce of certain metale in oree. It ie based on tho optical fact that complementary colors will extinguish each other if mixed in proper proportion—*e. g.*, if to a green solution a red solution he added iu euitablo proportion, the liquid will hecome colorless. Prof. Kœnig has applied this principle to tho colors which certain metale as iron, manganese, copper, etc., produce when fused with borax, the only chemical used in this method nf analysis. He preparee such glasses or beads contaiuing kuown quautities of a metal in 100 parts, and observes how thick a glass of the complementary color must be to produco extinction. This chromometer is furnisbed with a glass wedge of a green or red color, cut at an angle of ahout 1°. By moving this wedge before the glass bead witb the belp of a suitahle rack movemeut, a scale is moved at the same time, and when the point of extinction of color is arrived at the reading of the ecale refers to a table shewing the perceutage of metal contained in the examined substance. By this method of analysis a correct dctermination of manganese in iron ore can be made in 15 minutes, which is not more than one-third of the time required hy the usual metbods of analysis.

Frozen Dynamite.—Major Majendie, R. A., has made a series of experiments in order to ascertain whether dynamite in the frozen condition was more or less susceptible to explosion by percussion and by the action of fire than dynamite in an unfrozen plastic conditiou. This question is one which had not, so far as he is aware, been carefully investigated or determined, at any rate in this country. He has come to the conclusions that frozen dynamite is considerably less eensitive to explosion by a hlow than unfrozen dynamite; that cartridgee of dynamite having small quantities of exuded nitro-glycerine within them are decidedly more sensitive to explosion hy a blow than cartridges in which there is no such exudation; that frozen dynamite is much more susceptible to explosion by simple ignition than unfrozen dynamite; that frozen dynamite is much less sensitive to explosion by the impact of a bullet than uufrozen dynamite; that the danger attending the mere hreaking in two of a frozen dynamite cartridge does not seem to be of the formidahle character indicated by the Austrian regulations; and that frozen nitro-glycerine is not susceptible of detonation by detonators of the same strength as these with which the detonation of unfrozen nitro-glycerine may be readily and certainly effected. Major Majendie's report has been printed.

A Jew Among the Immortals.—M. Renan, the author of the life of Christ, and of several similar publications, has heen elected a member of the French Academy, and takes his seat among the 40 immortals of that grand assemblage of the scholarship of France. It is a remarkable fact and certainly a magnificent proof of the intellectual trepidity of the French people that, though both of the Napoleons sought the honor, neither of them succeeded in being elected members of the French Academy. The academy was founded by Cardinal Richelieu, who liberally endowed it from his own private fortune, and provided that it should never have more than 40 members, thus heing outside of the State, it has never been swallowed up or modified in any respect by that terrible centralism which in France has engulfed all other institutions in the changes of the last 100 years.—*Day Book.*

Analogy Between Animal and Plant Life. M. van der Harst, in Utrecht, has discovered in the common garden hean, when it hegins to sprout, a ferment analagous to pepsin, which can be extracted hy means of glycerine. It has the power of changing albuminoue into peptonic substances, and starch into glucose. It is found exclusively in the cotyledons. In the case of flesh-eating plants, all the eteps of digestion seem to take place in the eame manner as in animals.

The hypothesis of a one-time igneous fluidity of the earth was combated in a paper lately read before the French Academy hy M. Hermite, entitled "The Unity of Forces in Geology." He would explain the present form of the earth hy the presence and action of its seas, and denies that we are justified in assuming the existence of central fires or even of extensive eeas of lava, from the phenomena of volcanoes. For the paper *in extenso*, eee the *Comptes Rendus* of March 3d.

The Difference.—According to documente which have recently heen puhliehed, the differences of the speed with which electricity travels in overland wires and in suh-marine cahles ie enormous; the speed in a wire euspended in the air heing about 22,400 miles per eecond, and in a aub-marine wire only ahout 2,500 milee.

A Royal Commission on Coal-Mine Accidents.—A commission comprising iu its *personnel* the namee of several eminent scientific men, has just been formed in England, to investigate the following important questions relating to coal mining: The commissioners, we learn from the *English Mechanic*, are appointed "for the purpoec of inquiring and reporting whether, with reepect to the influeuce of fluctuations of atmospheric pressure upon the issue of fire-damp from coal; to the adoption and efficient application of trustworthy indicators of tho presence of fire-damp, aud generally to eystematio nbservation of the air in mines; to improved methods in ventilation and illumination; to the employment of explosive agents in the getting of minorals; and to other particulare relating to mines and mining operations, the resourcce of scicuce furnish any practicablo expedients that are not now in use, and are calculated to prevent tho occurrence of accidents, or limit their disastrous consequencce." The report of this commission will undoubtedly embody a large mass of facts and suggestions wbich will be of the highest value and importance to every class of mine operators.

Electricity and Rain.—Lord Rayleigh has communicated to the London Royal Society, a paper "On the Influence of Electricity on Colliding Water-drops," in which he points nut that he believes that the phenomena in some of the experiments he has made, suggest an explanation of tbe remarkable, "hut hitherto mysterious, connection between rain and elcctrical manifestatione." His experiments were on ordinary slender water jets, and the electricity was in some cases from a rubbed rod of sealing wax, and in othere from a single Grove cell. In the normal state ascending jete resolve themselves into drops, which evcn bcfore passing the summit, and still more after passing it, are scattered through a considerable width. When a feebly electrified body is brought near the jet, the stream is in appearance not broken up into drops—it becomes contiuuous; but with a powerful electric action the scattering becomes even greater than at first. The normal scattering is proved to be due to the rebound of the drops as they come in collision with one another. A number of further experiments with very slight electrical effect are heing tried, and a further communication on them is expccted.

Electrodynamic Induction.—It is a common impression among elcctricians that a telegraphic conducter can be withdrawn from the inductive influence of neighboring conductors by metallic envelopes whicb are connected with the ground, hut H. DeMauex tried some experiments in the month of Februaary, 1878, preparatory to the establishment of the telegraphic service of the French exposition, which led him to the discovery of a new law. In electrostatio action, the induction may be prevented hy the proposed method, hut the law relative to electrodynamic induction is thus stated: In a closed circuit the intensity of the current, which ie determined hy the induction of a cylindrical conducter upon another of the same form, cannot be changed even hy surrounding one or both of those conducters by a concentrio metallic envelope communicating with the ground through its entire length.

Von Oppolzer's Planet.—The tenth orhital confirmation of Chase'e harmonic astronomical prediction, represents the closest planetary proximity to the sun of which any indications have yet been found. There are six interior positions, but they are connected with planetary rotations. Von Oppolzer finde that hie orhit accords very well with the three latest observations, which are the most important because the exact time of observation is known. It alsn satisfactorily represents five other observations. It is impossible to connect it with either of Watson's two planets. Lescarbault's observation being one of the three latest, thie appears to be the true Vulcan, and other names must be found for its companions.—*Comptes Rendus.*

Influence of Color on Warmth of Soil.—By an extensive eeriee of experiments, E. Wollny shows that the color of the surfaco has an important influence on the heating of the ground in a dry condition, where the mineral constituents are substantially the same, and the difference in the quantity of humue is only such as to produce a difference of color, without changing the specific heat or conductivity.—*Dingler's Journal.*

Experiments on Production of Plants.—Prof. H. Hoffman has been for 22 years engaged in experiments on the modification of plants by interference in their external vital conditions. He concludes that the cause of the evolution of new species lies, not, as Darwin believes, in outward influences, hut in internal organic laws, whose nature is at present concealed.

Atmospheric Impurities.—It is estimated that England yearly usee 114,043,940 tons of coal. If we euppoee it to contain only one per cent. of eulphur, there is an annual infusion of 3,500,000 tons of sulphuric acid into the air, which the inhahitants are obliged to hreathe.

The use of chloride of calcium has been eug-geeted hy Prof. Thaler to he driven against the walls of coal mines in form of epray, to fix the duet (it being a deliquescent eubstance), and thus to reduce the liability of dust explosions.

Mining Share Market.

There has been little or nothing of interest in the share market during the past week. The same listlessness and inactivity still prevails, and it is doubtful whether a lighter aggregate of sales has characterized any other period during the year. The uncertainty concerning the new Constitution has had the worst possible effect on both operators and market, preventing them from doing either one thing or the other until its rejection or acceptance is decided. This gives the market a freedom from fluctuation or excitement which many construe into a "hopeful firmness." The general talk predicts an immediate rise after election, and it is to be hoped that such will be the case. The only event worthy of notice during the week was the wholly unaccountable spurt in the Comstocks on Monday. There was a sharper rise in Union Con., Sierra Nevada, Mexican and other north end stocks than has been seen for a month past. No definite reason can be assigned for the movement, and, in fact, it was only temporary, the prices falling again on Tuesday to their old level, from which they did not recover during the week.

Shasta County Notes.

April 19th, during our recent visit to the north, we gleaned the following notes from individuals in Shasta City, the county seat of Shasta county:

At Frank Litsch's store is to be seen a white quartz boulder, containing a large quantity of free gold, estimated to contain 39 ounces, valued at $700 dollars. It was found about three weeks ago in the placer claims of Gabriel Salort, on Flat creek, some 7 miles north of town.

At Wiser's, two miles below Shasta, several lodes are being prospected by Alvan Potter, a well-known miner of this region. He is down over 40 feet on the Wiser ledge. This and the old Spanish are showing good promise. We saw some very rich rock carrying visible free gold. Several new mining homes enlivens the wayside at this locality.

Near French Gulch, on the road to the Washington company, we pass the Highland claims, where Judge W. E. Hopping, after years of perseverence, has found his rich ledge again, in good and solid width, from which we expect to hear further decidedly good results.

On Washington hill, at French Gulch, the Washington company will resume mill operations next month. The Niagara has 200 tons of good looking ore out already, and are putting up an arastra for immediate work.

Kern and Shea are busy with their arastra on good rock. They have already enough out to last them over two years. They are well satisfied with their prospects. Mr. Willey has returned from the East and commenced work with new vim, together with his partner, Mr. Phillip. On the other side of the Gulch, the old Franklin is worked by Simon Sutter. It promises to become an excellent paying mine again. Further down, the Churchill company is working placer claims successfully, we understand. Several other claims are working thereabouts of which we have no report.

Several quartz claims at Whiskytown are paying very well. Grotefend & Co. have their mill completed on the old Peckham claim; will commence crushing next week on very fine ore. The Warfield & Co.'s claim (first extension south of the Peckham) are working an arastra with satisfactory results, of which we shall doubtless hear further hereafter.

On Dog creek, 30 miles north of Shasta, near the stage route to Yreka, there are several first-rate quartz claims. Smith & Co. are developing a ledge with indications, so far as prospected, of one of the best paying in the State.

The arastras (in many instances at least) in this county have fallen into good, practical hands, and are made to "pay as they go" in thoroughly testing the ledges before the erection of costly mills. Many capital-waiting prospectors elsewhere should make a note of this and follow suit for their own and the public good.

The quartz business, still looming up in Shasta county, seems destined to progress extensively for years to come. The increasing shipment of bullion is already telling a good story for this county.

Green & Halsey, of the Spring Creek Hydraulic Co., on Salt Pork ridge three miles east of Shasta, have a good supply of water and are now piping in full force. They are hopeful over the prospects of the season's work, and will not clean up until some time in June. A good report is then confidently looked for by those best posted.

On Thursday of last week we visited Nelson Waite and James Howe (partners with J. R. Jones), at Texas Springs, situated three miles up Clear creek from Bell's bridge and railroad crossing on the Reading ranch. They own the Clear Creek ditch, extending 50 miles from the Tower house to Texas Springs. Here 450 acres of patented land comprises part of their mining ground. They lately purchased 2,000 feet of iron pipe—11 and 13-inch—made by Francis Smith, S. F., which they are just now laying for working an old river channel considered very rich. They reckon the channel will average 100 feet or more wide by some 2,000 feet long. With two giant pipes and the improvements they are now putting in, the prospects seem to be that a rich and continuous harvest is close at their hands. The ditch supplies water the year round. Claims in this vicinity have yielded large sums of money in the old "hand to mouth" way of working. These hard workingmen have persevered to an extent worthy of all the success they seem destined to soon realize. Since 1849 Mr. Waite has mined in this section, and for a term of years in partnership with Mr. Howe. We may here mention that Messrs. Howe and Waite have applied for a patent on a new system of movable sluices calculated to work off flats having so limited a fall that they cannot otherwise be practicably worked. Their device is simple and can also be made serviceable in reclaiming ground for agricultural purposes.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

Amador Gravel.—*Ledger*, April 19: The claim comprises over 200 acres. A small gulch, coming in from the north, cuts the claim near the center. On either side the ground slopes up gently to an elevation of about 150 ft. Both banks are auriferous, but the eastern slope has so far monopolized the attention of the company. The manager has confined his attention up to the present time to opening up the mine for hydraulicing on a large scale. An open cut extends from the bed of the ravine into the hill a distance of 264 ft. This cut is in places 40 ft deep, and is intended for the reception of the flume. At the end of the cut, a well-defined gravel bed, 30 ft in thickness, is seen—evidently a river channel, or other large water way. The gravel is rather coarse, the boulders being smoothed and rounded, unmistakably showing the agency of water. A large proportion of the gravel is composed of quartz. The entire bank would wash freely, as very little pipe-clay or cement is met with. At the face of the cut, the gravel dips visibly. Supposing the gravel to hold its present level, when the crest of the hill is reached the pay dirt will be 100 ft in thickness. Different parts of the hill have been tested, and found to prospect well, and the outlook for an extensive and profitable hydraulic claim is flattering. Nine hundred ft of flume, three ft wide and two ft deep, is being constructed as rapidly as possible, and the work of putting it in position will soon commence. There is a branch ditch, three and a half miles long, connecting with the Amador canal. The ditch at present will carry 800 inches, but it is to be enlarged to a capacity of 1,000 inches. Inside of a month, it is expected to have everything in readiness to open upon the bank with from 800 to 1,000 inches of water. The claim at present gives employment to 10 men. All the appliances and conveniences necessary to mine on a scale in keeping with the vastness of the claim, are on the ground. There is a blacksmith's and carpenter shop, both fully equipped. Also, a commodious boarding house in course of erection.

Millo Mine.—The Millo Bros. have built a five-stamp mill at Middle Bar, to operate a quartz claim in that neighborhood. They have been busily engaged for months past in fitting up the mill, and it is now in first-class working order. The owners expect the rock they have on the dump to yield $20 per ton, and there is plenty more of the same quality in sight in the mine.

Miscellaneous.—F. H. Thoms & Co. have commenced sinking a shaft on a quartz ledge, three miles north of Plymouth, on the place of H. C. Davis. It is an old claim formerly worked by Jeese Morris, deceased. Joseph Burgas, "French Joe," in his claim about half a mile from Clinton, had the good fortune to pick up a $38 nugget, a day or two since. S. G. Spagnoli, in his hydraulic claim, frequently finds nuggets between clean-ups varying in value from $6 to $10.

CALAVERAS.

New Mill.—*Chronicle*, April 19: Active operations are in progress at the Mount Tmolus mine, Jesus Maria district. A new 10-stamp mill is being erected, and a large number of men are engaged in developing the mine. Levels are being run, stopes opened and everything got in shape for taking out ore rapidly when the mill is ready for crushing. Twenty-seven men are employed about the mill and mine, and a larger force will be put on as soon as taking out ore and milling is commenced. The Mount Tmolus is pretty well developed and known to be a good mine.

EL DORADO.

Kelsey Items.—Cor. Placerville *Democrat*, April 10: A crushing of rock taken from the croppings for a distance of 000 ft along the Estrella ledge, gave a return of $7 per ton. The rock crushed was the poorest that could be chosen, and was selected for the purpose of determining whether there was any barren rock in this lode or not. The tunnel of the Esperanza is now in to the lode, and the work of crosscutting the ore is going on rapidly; they have now driven into the ore body 12 ft and the ore is still solid in front, and good prospects are got with mortar and pan. Owing to the bad weather and other difficulties the work of clearing the Rosecranz of water is progressing slowly.

FRESNO.

Oro Fino.—Cor. *Republican*, April 12: The mill of the Fresno gold mining company has been running since the 18th of March, night and day, Sundays excepted, crushing in that time 00 tons of ore from the company's mines. On the 9th the mill was shut down and a very satisfactory clean-up made. The 60 tons of ore worked yielded 164 ounces of bullion worth $14 per ounce. The mines are showing splendidly, and new ground is being cut daily with the most flattering prospects. The mine and everything connected therewith is being worked and carried on, strictly on business principles and with the greatest economy. The mill will be started up again in a few days. Preparations are being made to commence work at Quartz mountain. The ledge of quartz is immense, averaging four ft in thickness, and the hanging wall, by some agency of nature, has entirely disappeared, leaving about 20 acres of the ledge exposed, so that there is nothing to do but to quarry it out and it is ready for milling. The owner of this immense ledge will commence the erection of a mill of large capacity immediately. The ore has been tested and will yield about $12 per ton. At the old Harbert mine, nine tons of ore were worked in an arastra which yielded over $65 per ton. There is an old 10-stamp mill on the property, and the ledge averages five ft in thickness, with a rich streak of 14 inches next the hanging wall, the quartz all carrying gold in paying quantity. The mine has been closed for seven years owing to financial embarrassment caused by bad management, which it is stated has been overcome, and work will shortly be resumed.

INYO.

Darwin Mines.—*Independent*, April 19: Mr. Wm. Ross, of Lookout, is reported to have discovered a very encouraging gold-quartz prospect, which is looking remarkably well, and he is shipping ore to San Francisco. It is located in Snow's canyon. They will soon start up again the five-stamp mill at Snow's canyon for a month's run or more. The New Coso mining company's furnace will start up shortly for a three or four weeks' run, and besides its own ores will smelt those from the following companies and mines: The Custer mine is still shipping ore, and already has over 100 tons at the furnace. The Modock mining company is now engaged in shipping 50 tons; the Minnietta Belle Co., by Beaudry & Belshaw, will send over about 60 tons; the San Ygnacio mine, owned by Rothschild & Greenly, has now on the way some seven tons, and it is expected that from 10 to 15 tons will be received from the Hindoo mine, the property of Messrs. Childs, Armstrong & Wallace. If the results are considered favorable after being sampled and assayed, the Modock Co. will probably send all their smelting ores over, as also the Custer, and no doubt the balance. The New Coso Co., through their superintendent, Mr. J. J. Williams, are offering favorable inducements to all parties having ore in limited quantities to have the same worked cheap.

MONO.

Standard.—*Standard*, April 21: The south drift from the main shaft, 385 level, is in 305 ft; progress during the week, 31 ft. The ledge is two ft wide, and looks well. The east crosscut from this drift, 300 ft south of shaft, is in 30 ft in very favorable ground. The north drift to connect with incline has been run 17 ft. The ledge is four ft wide of very good ore. An upraise has been started on this ledge 100 ft north of the main crosscut. This upraise shows a ledge four ft wide of very fine ore. The east crosscut, 700 level, is in 34 ft. The rock is very hard. The west crosscut, same level, is in 37 ft. The West Standard winze is down 60 ft. The ledge in the bottom is 18 inches wide of very rich ore. The south drift on the Gilden ledge is in 107 ft. The ledge is two ft wide and looks well. A new wire rope for the incline shaft has been received.

Bulwer.—The south drift, 380 level, has been advanced during the week 12 ft; total length, 262 ft. The ledge is two and one-half ft wide, and looks well. The west crosscut from this drift is in 100 ft. The rock in the face is still hard. Drifts north and south have been started on the last ledge cut in this crosscut at 50 ft west of the main south drift. The ledge is four ft wide of good ore. The south drift, 280 level, is in 80 ft; progress since last report, 13 ft. The ledge is here three ft wide, of good ore. Extracting ore and shipping to the Bodie mill has been resumed.

The Blackhawk.—The Warren ledge has been cut on the 320 level in west crosscut, about 90 ft from the shaft. The size and looks of the ledge are not unlike the showing on the 220; the fissure is widest south, or about three ft, and two and a half north, with very rich stratum on hanging wall of several inches thick, remainder of filling of lower grade. But little drifting has been done. The crosscut is still going ahead, as is that on the 220 level. Crosscutting is proceeding from the 320 level directly east from the shaft, in favorable formation.

Tioga.—The crosscut west from the main shaft, 520 level, is the most interesting feature of the mine. It will be pushed rapidly. The formation is very favorable. The crosscuts on 420 and 320 levels are going ahead as usual. It is probable that orders will come for pushing a lateral drift north from the 520 level to connect with the Syndicate main tunnel, and pushing things generally.

Con. Pacific.—The winze on ledge No. 2 has reached a depth of 133½ ft below the old tunnel, or about 160 ft below the surface. The ledge averaged over 20 inches in width all the way down of good ore. For several ft near the bottom it was very rich. A crosscut has been started west at this point to cut other ledges, especially ledge No. 1, distance 40 ft. The main shaft is down over 200 ft, and a contract is let to sink it to a depth of 250 ft, when crosscuts will be started both east and west. The formation is every way favorable at present.

Summit.—The north drift, 200 level, is in 126 ft; progress during the week, 21 ft. The ledge is 10 inches wide, and looks well. The east crosscut from this drift is in 24 ft in very hard rock. The south drift has been advanced, since last report, 35 ft; total length, 211 ft. The ledge here is 15 inches wide. The shaft is now down 50 ft below the 200 level. The ledge in the bottom is two ft wide.

Sigourney.—Work has been resumed on this fine property. The Sigourney is situated at the extreme south end of the mineral belt, so far as it is known to exist. The ledge has been prospected by a tunnel for a distance of nearly 200 ft, and found to be an average width of three ft. It carries silver principally.

Red Cloud Con.—The west crosscut, 400 level, is being extended beyond the Packard and Morton, and is in good vein-bearing ground. It will be continued to Red Cloud ledge No. 2. The east crosscut, same level, is being pushed ahead for the Westchester vein. On the 250 level the ore in the south drift is improving in quality.

South Bodie.—The shaft is down 495 ft. The formation is very favorable. After sinking a sump, a crosscut will be run east and west at 500 ft.

NEVADA.

Scadden Flat Mill.—Grass Valley *Union*, April 16: The stamps of the mill of the Scadden Flat mining company have commenced dropping. The mill contains two batteries of five stamps each. The platform is filled with a good quality of rock taken from the bottom of the mine, in which free gold can be seen, and which carries finely in heavy sulphurets and galena. The ledge in the mine is two ft in size, and no difficulty will be experienced in keeping the stamps going steadily. Besides the quartz taken out by the company, there are several hundred loads on the dump near by which have been raised by the tributers, and is now ready for crushing.

Miscellaneous.—*Foothill Tidings*, April 19: The owners of the Deadwood mine assumed control of the property on the 10th inst., the term of the last lease having expired. They expect to open up the 100 level farther south, on the chute, the north drift on that level having already been commenced. In the Pittsburg the 600 north stopes and drifts are yielding a large amount of good ore. The 700 north stopes are much improved and yielding finely. The 800 north drift and stope are producing a fine quality of ore, and never showed better than at present. The 800 south stopes are also yielding satisfactorily. The mill is kept running up to its full capacity and doing good work. The Idaho paid its 116th dividend this week, being $5 per share, and amounting to $15,500. Over $20,000 was paid out to employees and for supplies—keeping up the circulating medium. The Excelsior water and gravel mining company, of Smartsville, have declared a dividend of 25 cents per share, payable on Monday, April 21st. The tunnel of the Planet gravel mine is in a distance of 1,712 ft. An upraise is now being made to strike gravel. The Gold Hill mining company has levied an assessment of 10 cents per share, payable May 15th. Work on the mine will be resumed about May 1st. A few days ago, $5,000 was produced at a single clean-up from a mine in Little York township, being $2,000 in excess of any previous clean-up. The Milton and the Eureka Lake gravel mining companies each had a clean-up the other day, and though the claims are several miles apart, the result in each case was within a few cents of the same, $41,120. It is estimated by competent judges that during last week from $100,000 to $125,000 was cleaned up in the various gravel mines of Nevada county. The water in the shaft of the Knight of Malta mine has been lowered over 00 ft. It is expected that the water will be out before Monday, and a contract let to sink the main incline 100 ft deeper. The new shaft of the Washington is connected with the 100 level, but it will take some time to square up and timber. The New York mine, in Willow valley, near Nevada, is to be incorporated.

PLUMAS.

Alioth Notes.—Cor. *National*, April 12: The new discovery of Henry Neseman is a continuation of the streak he worked a few years ago, which, at that time, appeared simply as a rich spot in the bedrock (porphyry), without walls or any of the distinguishing evidences of a vein. The present opening is to the southwest of the former one, and reveals a true lode formation, the main paying streak being but a few inches in thickness, composed mainly of micaceous iron, but under the magnifier showing some quartz and iron garnet; the gold being quite free and of a deep, rich color. The wall on the hanging side carries gold in paying quantities through a width of 20 inches. The lead runs northeast and southwest, dipping at an angle of 40° to southeast. The best rock will be hauled to his ranch, and worked in an arastra driven by a horizontal wheel. A little to the south of the Neseman lead is the mine known as the King mine, an agatized quartz, upon which, at one time, a five-stamp mill was operated, but which was moved to the Betterton mine when it was promising so well. South of the King is a series of lodes located by different parties who have, at times, hauled and worked the rock in several ravines where water could be had for driving arastras. The Bullion and Poorman lodes are now being operated in that way by Messrs. Hapgood & Miller. Then comes, still going south, the Santa Rosa, Winnemucca, Sierra, Enterprise, Hawkeye, and Antelope, the latter holding a large percentage of copper; the vein from three to six ft wide, strike north and south, dip vertical. This has been explored by two shafts 1,000 ft apart, with a short tunnel between, and when worked by arastras has yielded a white bullion worth about $9 an ounce. The latter named mine is to be explored by a short tunnel to strike the lead over 150 ft deep, with a view to prepare against another season for active operations, working by one of the leaching processes, preferably the Hunt and Douglas, so as to save the gold, silver and copper, each separately, and nearly chemically pure.

SHASTA.

Opening up.—Reading *Independent*, April 17: The pump at the Donkey mine has been continuously working, and for some time men have been employed in taking out more of this rich and fine appearing ore. They have now a large number of miners at the dump. W. C. Boylan still continues as the Superintendent. The Afterthought mill is nearly done, and would have been completed and running before this but the winter has been so severe that they have got but little wood on hand and have been troubled about getting in other supplies. The new piece of road is done, the flume fully repaired, conveying to the mill the necessary amount of water required. Prof. O'Harra's, and other mechanical appliances that will be used in the new mill, will do away with a great deal of manual labor employed at other mills. The fact is that there will be no hand work used after the ore leaves the dump.

SIERRA.

Bunker Hill Mine.—*Mountain Messenger*, April 12: This mine, situated near Little Grizzly, on the ridge south of Poker flat, is under the active supervision of Hon. C. S. Abbott, and is now being rapidly developed under his management. Mr. Abbott struck pay dirt on the bedrock on the second week in February, and the first week all the men employed at the mine was engaged in drifting, and for several days took out $20 per day to the pick. During the month of March, Mr. Abbott extended tunnels and prepared for an increase of force. The pay gravel continues and the force will soon be increased. A contract has been let upon favorable terms for the company to extend the main tunnel 200 ft. This extension will thoroughly open the main channel and will enable the company to put on a large force. The company having an abundance of living water, a large bullion product will be produced this season.

Bonanza Company.—This company is pushing its work with rapidity, and will have its tunnel into pay gravel by September next, and from the fact of its lying next adjoining the famous Empire mining company's ground, and that the latter worked in rich ground up to the line, there can be no question of its proving a veritable bonanza in fact as well as in name to its owners.

TRINITY.

Cinnabar District.—Cor *Journal*, April 19: The main tunnel runs in a distance of 780 ft to the principal deposit of ore, and they intend running 50 ft beyond, where hoisting works will be built. Fifteen men are at work now besides the Chinese, and are taking out ore at a lively rate. The concentration works are running every day and getting out from 1,200 to 1,600 pounds of cinnabar daily, which will make seven or eight flasks of quicksilver. The retorts will start up the last of this month.

Bullychoop.—Work is going ahead in the Bullychoop & Occidental tunnel, but the progress is slow as the rock is very hard. The Sinclair four-stamp mill is being run to its full capacity. Mr. Knox is looking out a road over which he can get a 10-stamp mill, now on the way from San Francisco, to the mines. Sillcox & Co. continue to get splendid prospects in their new lode. Indications are that Bullychoop will be a lively camp this summer; much prospecting will be done and considerable gold taken from the mines now being worked.

TUOLUMNE.

The Kelsey.—*Independent*, April 19: The Kelsey mill is running night and day on good ore. The rock is soft and easily mined, so there is no difficulty in keeping the mill well supplied. The ore is conveyed from mine to mill in a car running on an elevated wire cable, a distance of some 300 yards. At the mill the car dumps itself and returns to the mine for another load. All the arrangements of the company have an eye to speed and economy in working, evincing an intelligent and systematic management.

Riverside.—At the Riverside, they are making good progress in the lower tunnel which is designed to get under the old workings at a great depth. Patent drills are used, driven by an air compressor. The tunnel is now in very hard rock, and is being made wide enough for two tracks. The mill is running on good rock, but the supply of ore is only sufficient to keep it going in the day time, the force having been reduced, and a gang of men put at work driving the lower tunnel. When this is finished, hoisting works will not be necessary; and it was not deemed economical to go to the expense of putting them up now, as in a few months the lower tunnel would be completed, rendering them of no further utility.

NEVADA.

WASHOE DISTRICT.

Belcher.—Gold Hill *News*, April 23: The south crosscut, 2360 level, has reached vein matter, but not yet the ledge proper. The face is in seams of clay and black dyke. The distance run here shows that the ledge has swung toward the east 80 ft in running south 360 ft. On the 2560 level crosscut No. 1, opposite the incline, is now into the ledge and is encountering quartz assaying from $10 to $12 per ton.

Trojan.—On the 3d level a crosscut has been started east at a point in the northeast drift, 114 ft beyond the upraise No. 5. This crosscut and the drift itself are making fair progress in quartz giving low assays.

Con. Virginia.—The joint drift west on the 850 level is making four ft per day in hard blasting porphyry. The joint drift west from the C. & C. shaft, 2150 level, is making five ft per day in fine-looking vein matter. Sinking at the C. & C. shaft, which has been interrupted by the breaking of a pump rod, has been resumed.

Savage.—The work of overhauling and repairing everything in and about the mine needing it, including the Gould & Curry drift, 1600 level, has been commenced. The water is slowly rising in the mine.

Lady Bryan.—Sinking and drifting north and south on the 600 level. The workings are all looking well, showing bright, lively quartz, but of low grade.

Sierra Nevada.—Sinking in the incline has been very much retarded of late by the heavy influx of water, and the difficulty experienced in keeping the pumps running to their full capacity all the time. The work of enlarging and timbering the north drift, 2200 level, is going rapidly forward, and less than 100 ft remain to reach the incline. The greater part of this distance will be run in the ore body. The pits and tanks in the east shaft have been completed and the drift is being extended north from the 2200 station.

Union Con.—The joint Mexican winze from the 1600 level is being continued on down, pumps having been put

Continued on page 276.

Meteorological.

On the Anomalous Vertical Distribution of Temperature in California.

Dr. Blake read a paper at a recent meeting of the Academy of Sciences on "The Anomalous Vertical Distribution of Temperature in California." In order to investigate the subject three sets of stations were chosen; one on the Sierra, one in the Tehachapi mountains and one in the Coast range. The Sierra stations were Sacramento, 30 feet; Colfax, at an elevation of 2,421 feet, and Emigrant Gap, 5,230 feet above the sea. The stations in the Tehachapi range were Sumner, 415 feet; Keene, 2,700 feet, and Tebachapi 3,954 feet. In the Coast ranges, Calistoga 400 feet and Dr. Blake's residence 2,100 feet above the sea. The months selected for comparison were Aug., 1878, for the maximum temperatures and Dec., 1878, for the minimum temperatures. Curves were drawn showing the daily temperature of each place in the different sets of stations, the curves for each place being distinguished by different colors. All these stations with the exception of my residence are stations on the different railroads, and it is owing to the rational foresight of the directors in having meteorological observations made at their different stations that we possess the means of elucidating this interesting subject. At these railroad stations the temperatures at 7 A. M., 2 P. M. and 9 P. M., with general observations on the condition of the weather are given, but a regular set of meteorological observations kept at my residence on the St. Helena mountain through the last 12 months, will enable us to connect the temperature anomalies we are considering with other meteorological conditions. In a paper recently read before the Academy by Mr. B. B. Redding, it is stated that "the foothills of the Sierra up to a hight of 2,500 feet, have apparently the same temperature as places in the valley having the same latitude." This is true to a great extent. Certainly it is much nearer the truth than the general opinion as to the effect of elevation in temperature would lead us to suspect. It is a well-known fact that on cold clear nights, low situations are more liable to be affected by frost, but this immunity from frost has been considered to extend but a few hundred feet above the valleys and not to some thousands of feet, as we shall find to be the case in this State. The general opinion of meteorologists is that temperature diminishes 1° for every 300 feet of elevation. If we now consider the temperature curves for December, we shall find that in the Sierra the minimum temperature of the middle station (Colfax, 2431 feet,) was higher than that of the lower station on 27 days, and at the upper station (Emigrant Gap, 5,230 feet,) higher on 18 days than that of Sacramento on the same day. The difference in temperature between Emigrant Gap and Sacramento amounting on some days to 19°, and being frequently at the upper station from 10° to 15° higher. On nine days during the month the minimum at Emigrant Gap was higher than at Colfax. The difference on one occasion being 11° in favor of the higher station. Analogous relations of temperature were found at the two other localities. On the Tehachapi mountains the minimum temperature at Keene (2,700 feet) was higher than that of Sumner on 24 days, and the highest station, Tehachapi (3,900 feet), had a higher minimum temperature then Sumner on 11 days. On the St. Helena range the minimum temperature, at my residence, was above that of Calistoga on 24 days; the difference on one occasion being 24° in favor of the highest station. When we consider a little more closely the above figures, we shall be able to judge what a very extraordinary distribution of temperature they indicate. According to its altitude, Emigrant Gap should have a temperature 17° lower than Sacramento, and yet, on one occasion, we find it 19° warmer, giving an anomaly of 36° above its calculated temperature. My residence is about 1,700 feet higher than Calistoga, and would therefore have a temperature 6° lower, but we find on some occasions the higher station 24° warmer than the lower; an anomalous distribution of temperature of 30° between two places but a short distance apart, and with only 1,700 feet difference in altitude. On examining the curves it will be seen that these anomalous temperatures are the result of a great fall in the temperature at the lower station and a rise in the temperature at the upper station. For instance, from the 2d to 3d of the month there is a fall in the minimum temperatures, at the lower station, of 5°, whilst at the upper station there is a rise of 5° (on the Coast range). On the Sierra there was, at the same dates, a fall of 4° at the lower station and a rise of 7° at Colfax, and on the Tehachapi range there was a fall of 4° at Sumner and a rise of 13° at Keene. In attempting to account for this abnormal distribution of temperature, we may observe on examining the curves that we find two periods during the month in which they either cross each other or come very close together. After diverging during the first four days of the month, they begin to approach each other on the fifth, and on the morning of the sixth we find both in the Sierra and at the Coast range the lower stations with the highest temperature. This change in the distribution of temperature was accomplished by a south wind and a fall of rain. The weather continued disturbed for the next three days, with rain again on the ninth. On the tenth strong north winds set in, and lasted until the 13th. From the 13th to the 24th the atmosphere was calm or light north winds prevailed, and during the whole of this period the upper stations were warmer. On the 24th the curves again came together, and on the 25th the lower stations have the highest temperature in the Coast range and at the Tehachapi mountains, and the minimum temperature is higher at Sacramento than at Emigrant Gap, for the first time for 11 days. This change in temperature distribution was again accompanied by a disturbed state of the atmosphere, snow falling at Emigrant Gap on the 24th. I think in view of these facts the only explanation that can be offered of this anomalous distribution of temperature is, that during a calm state of the atmosphere the lower stratum of air that has been heated in the valleys during the day gradually rises up *en masse*, its place being supplied by the cold air flowing down into the valleys over the surface of the ground that has been cooled by radiation during the long winter nights. This can only take place when there is a calm state of the atmosphere and when radiation is not obstructed by clouds or fogs, conditions that prevailed to a great degree during December. Under these circumstances the heated body of air gradually ascends, and as our temperature curves show can reach an elevation of at least 5,000 feet, and probably much higher. As to the rate at which this heated body of air ascends, farther observations must determine. The loss of heat of the ascending body of air by radiation and mixing with colder air, can be but slight, as the mere ascent of a body of air from the valley to an elevation of 5,000 feet would lower its temperature 27°, and as the highest temperature at Sacramento, for instance, on the 1st of the month, was only 7° higher than the minimum temperature at Emigrant Gap on the next morning, it is evident that the higher temperature at the upper station was not owing to any sudden ascent of warmer air from the valley. We find, however, that at Colfax, on the 1st of the month, the maximum temperature was 67°, and as the difference of level between Colfax and Emigrant Gap is about 2,800 feet, a body of air, in rising from Colfax to the upper station, would have its temperature lowered 14°, so that at the time it reached the level of the upper station its temperature would be 53°. The temperature at Emigrant Gap, on the morning of the 2d, was 51° There are other considerations which support the view I have taken as to the cause of the higher temperature of the upper stations. For instance, on calm nights we often find that the temperature at the upper stations instead of falling during the night is really higher at 7 A. M. in the morning than at 9 P. M. on the previous evening. For instance, taking the first five days in December, during which the air was calm, the average temperature of the different stations at 9 P. M. and at 7 A. M., on the next morning, were:

	9 P. M.	7 A. M.	Difference
Sacramento	50°	41°	—9°
Colfax	49 6°	49.8°	+0.2°
Emigrant Gap	52°	52°	0°

If we now compare the temperatures taken at the same hours from the 11th to the 15th, a period during which a strong northb wind was blowing, we shall see the effect of atmospheric disturbance on the temperature at the same stations:

	9 P. M.	7 A. M.	Difference.
Sacramento	46 6°	35 4°	—5.2°
Colfax	38.8°	34.6°	—4.2°
Emigrant Gap	32.2°	31.6°	—0.6°

In the first case when the air was calm the fall at the lower station during the night was 9°, at the middle station there was a slight rise, and at the upper station the 9 P. M. and 7 A. M. temperatures were the same; the upper station having the highest temperature, the middle station being 2.2° lower, and the lower station 11° colder than the upper. When, however, the atmosphere is disturbed the relative temperature of the stations is completely reversed. We now find the lowest temperature at the highest station, and a fall of temperature at all the stations during the night. The same fact is again illustrated if we compare the mean temperatures of the different stations for the two months, January and December, 1878; the former a rainy and stormy month, the latter calm and clear:

Mean Temperature.

	January.	December.
Sacramento	48.64°	44.86°
Colfax	44.56°	47.05°
Emigrant Gap	34.46°	41.36°

We here find that, in the calm month, the mean temperature of Sacramento is 2° lower than Colfax, whilst in the stormy month it is 4° higher. The difference of temperature between the upper station and Sacramento is only 3.5° lower in December, whilst in January it is 14° lower. This relative distribution of temperature prevails in each of the other localities. It is not quite so strongly marked on the Tehachapi mountain as on the main Sierra, but is greater between the two stations on the Coast range, and undoubtedly will be found to prevail throughout the whole of the interior of the State. The fact is a most important one in its relation to the cultivation of semi-tropical fruits. The only time at which they are liable to be injured, at least up to an elevation of 3,000 feet, is during calm and cold nights, and on such nights as has been plainly shown it is the more elevated places that are the warmer. During our stormy weather, even in midwinter, the temperature never falls low enough at the elevation above given to injure them. At my residence most of the orange trees that were planted out only last season are uninjured. They certainly have suffered less than at Los Angeles, where a temperature of 23° has been reported, whilst at my residence the thermometer has not been lower than 29°. As regards the curves for the maximum daily temperature for August, it is only at the stations on the main Sierra that we find any anomalous distribution of temperature. Both at the Tehachapi stations and on the Coast range we find the highest temperatures at the lower stations. The maximum temperature at Colfax was higher than that at Sacramento on every day of the month except three, the higher station being on some days 12° warmer than the lower. On only three days during the month was the maximum temperature at Emigrant Gap higher than at Sacramento, and it was never as high as at Colfax. On two of the days on which the maximum temperature at Emigrant Gap was higher than at Sacramento, the temperature of the upper air had been raised by an eruption of the warm southwest antitrade current, and on the other occasion, the temperature at Sacramento had been lowered by the winds from the ocean. My observations record a strong southwest upper current on the day preceding the rise in the upper strata, and there is a record of fog on St. Helena mountain at the date in which the temperature at Sacramento fell below that of Emigrant Gap. Both at the Tehachapi and Coast range stations the maximum temperature of the lower stations was always the highest, the average difference between Sumner and Keene being about 10°, and between Calistoga and my residence about 13°. On one occasion the difference was 21°. The same explanation that I have given for the anomalous distribution of temperature during the winter will, I think, explain the higher temperature at Colfax during the summer, viz.: the ascent of a body of heated air from the valley. One of the conditions of the ascent of such a body of air is that its place can be supplied from other sources. During the long winter nights this condition is secured by the cold air flowing into the valleye along the surface of the ground cooled by radiation. In summer no such source of supply exists, at least to any great extent, as the nights are short and the surface of the earth has been heated during the long summer days. At the only place where the anomalous distribution of temperature prevails during the summer months, viz.: in the Sacramento valley, we have a supply of cool air in the winds from the bay which reach there every afternoon, and which continue as a gentle breeze well on into the night. This gives the warmer air of the valley a chance to ascend, and thus it is that here we find a higher temperature at a greater altitude. These sea breezes do not reach the upper part of the San Joaquin valley, and are but little felt at Calistoga, so that at neither of these places can there be much vertical displacement of the heated air of the valleys. The subject of the modification of climate by this vertical displacement of bodies of air is one of much interest, both in its scientific and practical bearings, and one which has not received much attention from meteorologists. I hope on some future occasion to be able to discuss it more fully.

The Hum of Telegraph Wires.—Every boy living in the country near a telegraph line has listened to the hum which can be often heard near a telegraph pole. It is a juvenile theory that the noise is caused by the passage of the messages. The more general notion has been that it was caused by the wind. A writer in an Australian journal, however, calls attention to the fact that one who will give close observation to both the wire and the sounds will find that the latter make themselves obvious when there is a total absence of wind; and in a quiet morning in winter, when the wires appear to be covered with frost to the thickness of a finger, they nevertheless carry on lively vibrations while the air is totally quiet. According to this writer, therefore, the vibrations are due not to the wind, but to changes of atmospheric temperature, cold producing a shortening of the wires extending over the whole length of the conductor. A considerable amount of friction is produced on the supporting belle, thus inducing sound both in the wires and the poles.

"Red Snow."—The phenomenon of "red snow" is visible near Cardwell's Summit hotel. This snow is usually confined to Arctic latitudes, but on the lofty summit south of Mount Stanford, there is a patch of several acres. The surface of the vast drifte, to a depth of three or four inches, is of a beautiful pinkish tint. Scientists differ as to the cause of this wonderful freak of nature, but the accepted theory is that it is produced by myriads of minute organism. The sight of the lofty peake covered with this "red snow" is well worth a trip to the Summit.—*Truckee Republican.*

Frost in a Mine.—The Georgetown *Miner* learns from Col. R. A. Pomeroy, manager of the Stevens mine, that frost has been encountered at a depth of 540 feet while sinking the shaft in that mine. The ground is frozen to a depth of 350 feet, but below that no frost has been encountered until a depth of 450 feet was reached, where the ore, when broken, shows frost and ice through it. The mine is located near Gray's peak, and is about 12,000 feet above sea level.

The Engineer.

A New Range Finder.

A new instrument for measuring distances by sight has been invented by Mr. G. W. Hart, of Croydon. The distance of any object is ascertained thereby, by reading off upon a scale marked on the base of a right-angled triangle the number of divisions which are equivalent to the angle of two lines of sight denoted by an index scale, the two sides of the triangle (*i. e.*, the perpendicular and the hypothenuse) being the two lines of sight to the object, and the length of the base varying with the distance of the object observed at the apex of the triangle. The distance of the same is measured by the length of base required to enable the perpendicular line of sight to meet the object on the oblique line. The oblique line of sight in the instrument is obtained along a radius-arm, the angle of which to the base may be set at pleasure. The part of the instrument forming the other line of sight at right angles to the base has a sliding action along the base (so as to enable the latter to be lengthened or reduced), but is always at right angles to it. For the base a space is divided of 6.282 inches, thus allowing decimal readings of the length of the base to be obtained, (6.282 being the proportion of circle circumference to radius). A scale is provided by means of which the radius arm may be set for oblique line of sight to the decimal of a degree. The process of reading off the distance of an object on the instrument may be thus illustrated. As the chord of arc of an angle is to the radius as 1 to 57.35, then if the radius arm be 57.35 inches, it follows that for an angle of one degree it will be one inch out of perpendicular to the base. The oblique line of sight, being along the radius arm, will, therefore, meet at 57.35, the perpendicular line of sight with one-inch base, and the object (at the apex of the triangle) will be distant 57.35 inches from the observer, *i. e.*, 57.35 times the length of the base line. The base line being divided to scale, the distance of the object may thus be read off.

Improved Tramway Rails.—The object of the following construction of rails for tramways as designed by Mr. J. Gowans, of Edinburgh, is to produce a continuous line of metallic tramway, and to give a steadier vertical support immediately under that part of the table or surface of the rail on which the wheels of the cars tread, by which means a lighter and therefore cheaper rail may be employed than hitherto. The rails are formed of a vertical web, with a continuous flat foot projecting as a flanch on either side. The vertical web is situated immediately under the top table or flat wearing surface of the rails, and the flanch of the foot nearest to that surface is broader than that at the opposite side, in order that a larger area may be exposed at that side of the foot where the load principally presses. The flanch in both cases is made broad enough to constitute a foundation for the concrete or paving setts on each side of the rail. The web of the rail is equi-distant formed with openings, so as to diminish the amount of metal, and therefore lighten it. The rails are jointed together either by plates under the feet, with bolts passing through them and through the joint plates; or a portion of the body of the rail is cut away, and the flanch foot of one rail is made to overlap the flanch foot of the next rail, with bolts passing through the overlapping portion. The rails, as above constructed, may also be jointed by overlapping a portion of their webs, bolts being passed through the overlapping portions; in this case pieces of the ends of the upper surface of the rail and of the foot have to be cut away.

War Application of Boyton's Swimming-Suit.—We learn that the French army has made an ingenious application of Captain Boyton's swimming-suit. A squadron of Cuirassiers—not the men, but the horses—have been provided with this kind of clothing. The horses, thus equipped, have been able to swim across the river Seine with the greatest ease. The double india-rubber garment, after having been filled with air by blowing, is found to be capable of supporting in the water a horse and his rider. This new means of crossing rivers with ease and safety cannot fail to become of much importance in time of war.

New York Elevated Railway.—The business of the elevated railways in New York seems already to have exceeded expectation and to be steadily increasing, week by week. During the months of January, February and March the N. Y. Elevated road carried 7,539,476 passengers, while the Metropolitan Elevated road carried 3,935,623, being a total of 11,475,099 for both roads. Taking the increased facilities for travel that are being prepared by the roads into consideration it is believed that the two roads will carry over 50,000,000 passengers during the year.

The East River Bridge.—The recent decision affirming the liability of New York for additional funds to secure the completion of the bridge, is admitted to definitely settle the question of its rapid completion. It is now reported that work is to be commenced on it at once. The President of the Board of Trustees is reported to have stated that the completion of the structure has been delayed a year by the New York legal complication just disposed of.

The Edison Electric Light.

An apparently well-informed New York correspondent of the London *Times* says that Mr. Edison has failed in his experiments, so far as any really practical results are concerned. The most that he has ever yet accomplished has been to maintain 400 coiled iron wires in a state of partial incandescence with a 16 horse-power steam-engine. The object of this experiment was to ascertain the number of coils which could be brought to a red heat in any given circuit. It is upon this experiment that Mr. Edison based his claim that he could maintain 20,000 lights burning from one electrical station with a 600 horse-power engine. The conclusion was a fallacious one, as Mr. Edison now knows. Platinum must be heated to 2,700° before it attains the intensity of incandescence which is required for illumination, and when the metal is as hot as that it is just on the verge of melting. To prevent the lamp from melting, this inventor has used a regulator consisting of a bar metal through which the current flowed, which, when the current became too strong, expanded and switched off a part of the current and thus saved the lamp. In practice this regulator has failed to perform the service required of it. When the current becomes strong, the platinum burner melts in the twinkling of an eye, and the mischief is done before the regulator can act. The inventor believed that he could overcome this practical difficulty, but he has not succeeded. His lamps have continually melted and he has been unable to keep them from doing so, and the result is that there is great discouragement at Menlo Park.

There has also been encountered, says the same correspondent another difficulty. Fourteen out of the sixteen claims which Mr. Edison calls for in his application for a patent at Washington, have been rejected. This impulsive man took up the electric light last fall as an entirely new subject of experiment, and allowed himself to believe that he saw a way to make the light useful, which others had never thought of; but when he reached the Patent Office, he discovered that very nearly every idea which he had embodied in his applications had either been covered by the patent of other inventors, or was not patentable at all. This information is obtained from the Patent Office, and is one explanation of the discouragement which reigns at Menlo Park.

There is no doubt that the Edison light would be a delightful resource for the illumination of dwellings, if it could be depended upon. It floods a room as though with golden sunlight—pure, brilliant and mellow. But the inventor has never yet been able to regulate his current, so as to keep his lamps burning for any length of time, and he has never ventured on a single public exhibition of it. The public have never seen so much as one of his lights yet. A favored few who have been admitted to his laboratory at Menlo Park have beheld it—a single lamp, inclosed in a glass globe, beautiful as the light of the morning star. But he has refused to let any one inspect it closely, and he has never allowed the exhibition of it privately to last long. He has never been able to depend upon its durability. His apparatus is as far from perfection as it ever was, and in fact, well-informed electricians in New York do not now believe that Mr. Edison is even on the right line of experiment.

Other Efforts at Electric Lighting.

Some seven or eight other parties are in the field, more or less prominently; but none have as yet come much, if any nearer to any practical result, than has Mr. Edison. The efforts of Mr. Sawyer in the attempt to maintain a slender crayon of carbon in incandescence in a sealed globe of pure nitrogen, are also far from success. The light is beautiful, and about all that can be desired; but the difficulties encountered are very perplexing. They consist mainly in the getting rid of every trace of oxygen within the globes and the rapid removal of the heat generated therein by the incandescent carbon. If the heat is not carried off in some manner, the temperature of the nitrogen rises so high that the glass globe is liable to crack in a draft of air or in cooling when the light is extinguished. The cracking of the glass permits the oxygen to enter, and away goes the carbon in 10 minutes' time. In order to obviate this trouble, a coil of very large wire, like a spiral spring, is introduced within the globe, being made to do duty as part of the conduit of the electrical current. This coil absorbs the heat from the nitrogen atmosphere and conducts it rapidly to the large iron plate forming the base of the lamp, and radiates it into the open air. The arrangement promises to answer very well, as soon as the proper size of the globe and wire and plate have been hit upon. He has broken some 50 globes in his experiments; but has finally bit upon what he thinks is the correct proportions. The removal of the oxygen gives him the greatest trouble. The carbon itself seems to carry sufficient oxygen to work its own destruction at a slow but sure progress.

The Electric Light in San Francisco.

A company has been formed in this city with the view of introducing the electric light here, for general use in the streets, public buildings, and stores. The announcement has been made that the company has already entered into a contract for lighting Kearny street, from Clay to Market, with four electric lights to the block, each light to be of 1,000 candle power. Several stores and saloons on the same street have also desired to be supplied with the light. Arrangements are progressing for the lighting of the Mechanics' Pavilion during the next fair there. The company is experimenting with a patent regulator, with which the light can be increased or diminished at will. They have bought a number of patents for use on this coast, but we believe they are working mainly upon the Jablockhoff process, which was brought into quite prominent notice at the late Paris exhibition. Although the electric light is yet far from being a success, enough has been done to assure the highest promise of an ultimate triumph of electricity over gas.

Good Health.

Why so Depressing?

During the early spring months it is common to hear persons speak of their feelings in the manner the London *Lancet* describes, as follows: "Unwonted depression and uneasiness, accompanied with loss of appetite and inability to sleep, are the prevalent causes of complaint just now among the 'tolerably well' section of the community; and, with a large measure of accuracy, the condition, modified as it is by individual peculiarities of state and idiosyncrasies, is attributed to the weather. The relations which subsist between such mental depression as constitutes melancholia and the defective discharge of its functions by the skin may help to explain the phenomenon. The connection of cause and effect may not be clearly made out, and the part which the nerve-centers play in the production of the result may be as obscure as that which they exercise in the control of occasional pigmentary deposits; but the broad fact remains. When the skin does not act freely, when its functions are seriously impeded or arrested, melancholy broods over the mind, just as in the case of a subject of melancholia, as a formulated disease, the skin becomes dense and inactive. It is not a random conjecture, therefore, that the intense and prolonged, albeit unaccustomed and unexpected, cold and damp work their depressing influences mainly through the skin. This is a trite remark, but it is one that may, with advantage, be made just now, because, in the interests of health preservation, especial pains need to be taken to secure the freest possible action of the great surface system of excretory glands and the transuding apparatus generally. Warmer clothing, especially at night, frequent ablutions, with sufficient friction, and the promotion of skin activity by every legitimate form of exercise, are obvious measures of health which everybody ought to understand and all should practice.

A Chapter on Stings.

The pain caused by the sting of a plant or insect is the result of a certain amount of acid poison injected into the blood. The first thing to be done is to press the tube of a small key from side to side to facilitate the expulsion of the sting and its accompanying poison. The sting, if left in the wound, should be carefully extracted, otherwise it will greatly increase the local irritation. The poison of stings being acid, common sense points to the alkalies as the proper means of cure. Among the most easily produced remedies may be mentioned soft soap, liquor of ammonia (spirits of hartshorn), smelling salts, washing soda, quick lime made into a paste with water, the juice of an onion, tobacco juice, chewed tobacco, bruised dock leaves, tomato juice, wood ashes, tobacco ashes and carbonate of soda. If the sting be severe, rest and coolness should be added to the other remedies, more especially in the case of nervous subjects. Nothing is so apt to make the poison so active as heat, and nothing favors its activity less than cold. Let the body be kept cool and at rest, and the activity of the poison will be reduced to a minimum. Any active exertion whereby the circulation is quickened, will increase both pain and swelling. If the swelling be severe, the part may be rubbed with sweet oil or a drop or two of laudanum. Stings in the eye, ear, mouth, or throat sometimes lead to serious consequences; in such cases medical advice should always be sought for as soon as possible.—*Horticulturist.*

How to Keep Ice in the Sick-Room.—For those who have an abundant supply of ice, this may not be a matter of much moment; but for poor people, who may rarely use ice except in sickness, and to whom the expense is not insignificant, the following hints from an English source may be useful: "Cut a piece of flannel about nine inches square, and secure it by a ligature round the mouth of an ordinary tumbler, so as to leave a cup-shaped depression of flannel within the tumbler to about half its depth. In the flannel cup so constructed pieces of ice may be preserved many hours; all the longer if a piece of flannel from four to five inches square be used as a loose cover to the ice-cup. Cheap flannel, with comparatively open meshes, is preferable, as the water easily drains through it, and the ice is thus kept quite dry. When good flannel with close texture is employed, a small hole must be made in the bottom of the flannel cup; otherwise it holds the water and facilitates the melting of the ice, which is, nevertheless, preserved much longer than in the naked cup or tumbler. In a tumbler containing a flannel cup, made as above described, of cheap, open flannel, at 10d. (20 cents) a yard, it took ten hours and ten minutes to dissolve two ounces of ice, whereas in a naked cup, under the same conditions, all the ice was gone in less three hours."

The Poison of Serpents.—Some interesting observations have recently been made on the poison of serpents by M. Lacerda, in the physiological laboratory of the National Museum, at Rio Janeiro, and which have led the experimenter to conclude that, in some cases at least, the venom contains an organized ferment, presenting some analogies to bacteria. M. Lacerda states that a drop of poison removed from a rattlesnake under the influence of chloroform, and examined with the aid of the microscope, appears as "a species of filamentous protoplasmic matter, consisting of a cellular aggregation disposed in arborescent form resembling certaioly copods." These cells are fully described in a paper read before the French Academy of Sciences. Similar phenomena were observed in the blood of animals that had been bitten by a rattlesnake, and it was found that such blood was capable of setting up the same change in the blood of other animals when injected hypodermically, and that this change was always followed by the death of the animal.

Religion and Chloroform.—Dr. B. W. Richardson lately gave a Sunday afternoon lecture in London on "Anæsthetic Sleep and Temporary Abolition of Pain." He remarked that the credit of having introduced chloroform belonged to the late Sir James Simpson, of Edinburgh. Its introduction and application were objected to on religious grounds, some people contending that man, according to Scripture, should endure pain and trouble throughout life. Sir James Simpson threw the scriptural argument back upon those who used it by saying that when the first man had an operation performed upon him he was put in a deep sleep, and knew nothing of the time when the rib was taken from him.

A Recipe to be Miserable.—The best recipe we know, if you want to be miserable, is to think about yourself, how much you have lost, how much you have not made, and the poor prospect for the future. A brave man, with a soul in him, gets out of such pitiful ruts and laughs at discouragements, rolls up his sleeves, whistles and sings, and makes the best of life. This earth was never intended for a paradise, and a man who rises above his discouragements and keeps his manhood will only be the stronger and better for his adversities. Many a noble ship has been saved by throwing overboard its most valuable cargo, and many a man is better and more humane after he has lost his gold.

Useful Information.

Shoemaker's Wax.—Shoemaker's wax, when made for hand work, is composed generally of equal quantities of pitch and resin, with 10% of tallow; after boiling (if good wax), it is pulled until the wax assumes the color of pale resin. The pulling takes out, or, more properly, bleaches, the ingredient pitch, and thereby takes out the coloring all pitch contains. Wax used for machines has all of it too much pitch and tar for clean work. The coloring matter in pitch and tar comes up through the grain; once in it cannot be got out—and wax boiled or heated again, unless in a perfectly clean vessel, and even then, partly recovers the coloring bleached out by hand pulling. Wax that will work up the pure bronze color so much liked by shoemakers may be made of four pounds of resin, one pound of pitch, four ounces of beeswax, three ounces of tallow—the tallow to be refined, otherwise three ounces of the best sperm oil. The beeswax seems to destroy the coloring matter of the pitch when in that proportion. A good resin wax is superior to any other composition for wear, because it decomposes on exposure and wear into a stony substance in appearance, and looks not unlike pegs of amber when put under the microscope. Wax, with tar at all in it, or much pitch, when heated continuously, becomes only a dirty discoloring matter, as the oil evaporates, carrying with it all the valuable adhesive or glutinous properties of the pitch, and such wax will most readily soil or discolor the flange of the channel that is laid over it. The above recipe makes a wax which will give satisfaction.

Steeling Copper Plates.—One hundred parts of ammonio-ferrous sulphate and 50 parts of ammonium chloride are dissolved in 500 parts of pure water, a few drops of sulphuric acid are added, the liquid is maintained at 60° to 80°, and the copper plate is immersed in this liquid, and is made the cathode of a system of two or three Bunsen's cells, the anode consisting of an iron plate equal in size to the copper. In a few minutes the copper plate becomes covered with a hard steel-like deposit of iron.—*Chem. Centr.*

Dry Coating for Basement Walls.—Take 50 pounds pitch, 30 pounds resin, 6 pounds English red, and 12 pounds brick-dust. Boil these ingredients and mix them thoroughly; then add about one-fourth the volume of oil of turpentine, or enough to flow easily, so that a thin coating may be laid on with a whitewash or paint brush. Walls thus coated are proof against dampness.—*Der Techniker.*

Porosity of Building Stone.—The Buffalo *Commercial* gives the following account of an interesting experiment with building-stone in that city: "Professor Doremus, of the Buffalo Medical College, recently performed a very interesting and instructive experiment before his class. A block of sandstone, such as is usually employed for window caps and sills, and about 12 inches square and four or five inches thick, had a panel one-half an inch deep in each side. In each panel was fitted a block, which was perforated by a piece of common gas-pipe, and this was cemented about the edge. The whole was then coated with an impervious varnish. Air now entering the pipe on either side had access to the clean surface of the stone beneath the panel, and it was found that if the mouth be applied to the protruding pipe on one side, and a candle be placed in front of the opposite one, it could be very readily blown out by the air, which, with very little effort, was forced through the stone. When a rubber tube was connected with the house gas-pipe on one side of the stone, and a burner was attached on the opposite side, the simple pressure from the gas main was sufficient to force the gas through the stone till it was lit at the burner on the opposite side. When by any means the pressure was increased, a very large flame was thus produced. This shows the permeability of building stone. Brick walls and the plastering of rooms are much more porous, and it is readily seen that unglazed tile, or stone, or brick sewer, affords but little security against the escape of sewer-gas."

To Tan Lace Leather with Soft Soap.—The skin or pelt should be unhaired with lime in the usual way, and, after the hair is removed, the pelt should be freed from lime as much as possible. This can be done with warm water or the ordinary bates. When thus prepared, the pelt is immersed in soft soap and frequently handled, just as in tan liquor. The soap should be kept up to the usual strength, otherwise the pelt will perish. Indeed, there should be rather an excess of alkali over the grease always maintained. The ordinary soft soap bought in stores is not strong enough; but strong country-made soft soap will tan or taw the pelt in a few days. After the pelt is struck through, it should be scraped off and dried; when dry, or nearly so, it should be *mooned* until soft. No oil or other finishing will be required. This process will make tough lace leather that will not become tender by age, and it is withal a cheap process. Its excellence has been tested by some of the best manufacturers in the country.

Sal Soda for unhairing hides and skins is used in connection with lime and sulphur. The particular merit of the soda lies in the readiness with which it removes all grease from the hides, but, used alone, its action would be too severe, and sulphur is employed to counteract this. For a pack of 50 hides, slake 80 pounds of stone lime, and with the thick paste which this yields knead thoroughly 10 pounds each of soda ash and pulverized sulphur, mixing with only a small portion of the lime at first, but completing the mixture while the lime is yet warm; to this add lime liquor, mixing thoroughly, and then pour into the vat and plunge the whole. No more liquor should be in the vat than sufficient to cover the hides when thrown in. The lime should be kept up to summer heat, and the stock should be handled at least once or twice a day.

To Clean Marble.—Common soda, two parts; pumice stone (pulverized), one; finely powdered chalk, one. Sift through a fine sieve and mix with water. Rub all over the marble until the stains are removed. Then wash the stone with soap and water. Marble that is yellow with age, or covered with green fungoid patches, may be rendered white by first washing it with a solution of permanganate of potash of moderate strength, and while yet moist with this solution, rubbing with a cloth saturated with oxalic acid. As soon as the portion of the stone operated upon becomes white, it should be thoroughly washed with pure water to remove all traces of the acid.

New Uses of Sawdust.—We have tried the experiment in our garden of mixing the rich, heavy, solid, clayish earth with sawdust, and find it makes the soil loose, giving a chance for water and air to penetrate, preventing the hard caking on the top, which before was a most objectionable fault, while the plants and seeds grow better than ever before. We ought to mention that we have also added some bone-dust, and moistened all with a weak solution of nitrate of potash.—*Ex.*

Brass Solder for Iron.—Melt the plates of brass between the pieces that are to be joined. When the work is very fine the parts to be brazed should be covered with powdered borax, melted with water, so that it may mix with the brass powder which is to be added to it. Expose the piece to a clear fire in such a manner that it shall not touch the coals, and let it remain till the brass begins to run.

Fire-proof paper for valuable documents may be made from one part vegetable fiber, two parts asbestos, one-tenth of a part borax, nine-tenths of a part alum. A fire-proof ink for the same may be made from 850 grains graphite, 80 grains copal varnish, 75 grains copperas, 300 grains tincture of galls and indigo carmine.—*Der Techniker.*

Union Brass Foundry, Giovannini & Co. S. F.

The Week.

The mining outlook on the Pacific coast still continues unusually promising. In California the operations are everywhere keeping pace with the bountiful facilities afforded by the season. Bodie shares continue to gain in favor in the stock market and the town itself is crazed over the richness of its new placer diggings. Shasta has new finds in old workings, and Amador prospects of rich new discoveries. The Monterey coal mines are being actively opened up, and promise soon to become profitable. In Nevada, operations are more quiet. The Comstocks remain dull and listless, but from the outside districts, and especially the new placers, come reports of valuable locations and rich discoveries. Important developments have been made in the Good Hope district, and the camps present a very lively appearance. The Paradise mines speak solidly through their constant bullion shipments. In Colorado the condition of things is equally good. Leadville continues to be the center of attraction, and their local papers are full of successful finds by their prospectors. The adjacent country seems almost wholly made up of the silver carbonate ore. The new diggings at Ten Mile and Middlepark, however, are rapidly advancing to a position of equality with Leadville. Idaho is wide awake, but suffers from inaccessibility and lack of capital. Silver Reef, Utah, is operating more extensively and producing more bullion than ever before. New Mexico is interesting California capital. And finally Arizona sees interest settled on the Tombstone district and the southeastern part of the Territory generally.

The Mining Industry—Its Condition and Outlook.

Thus far during the current year the business of mining for the precious metals on this coast has been well prospered. We speak, of course, of productive mining, the speculative branches of the business having suffered unusual depression. Hardly ever have stock operations so languished. The revealment of other bonanzas on the Comstock, now deemed imminent, will be likely, however, to restore animation to the mining share market. Whether or not this shall prove to be the case, certain it is the working miners are pushing their labors with unwonted energy and with every prospect that they will harvest this year a full crop of bullion. Never since the first pan of dirt was washed at Sutter's mill, has mining seemed to be in a more healthful and progressive condition than at present. That the investors and toilers in this field of industry are really about entering upon a season of large and prolonged prosperity can hardly be questioned. The weather thus far has been exceedingly propitious. The rains coming at regular intervals and in acceptable quantity have afforded water for all—the quartz, the drift and the hydraulic miner alike. There has been water enough for every use without damaging floods. The temperature has, for the most part, been moderate, favoring hydraulic washing and other outdoor work. A good body of snow has accumulated on the mountains, insuring to this class of miners a working season of average length, at least. As these parties had gotten their claims in good shape betimes, they have been able to make the most out of the water since the advent of the rains, washing having gone on with less interruption than usual. Already some extremely large and many satisfactory clean-ups have been made, leaving little doubt but the product of gold dust from this source will, the present season, be large beyond precedent.

Meantime, the Dehris case, lately decided against the miners, goes to a higher court on appeal, the defendents having executed an indemnifying bond and proceeded with their gravel washing as before. A party of experts from the office of the State Surveyor-General have for some time past been engaged on the Yuba ascertaining the quantity of this mining debris that has been and is hereafter likely to be deposited in the bed of that river and the effects thereof, and in collecting such other facts as may be useful in determining the issues now pending between the farmers and the miners. After finishing their work on the Yuba this party will make a like examination of the tailings on Bear river. As this action by the public authorities evinces a desire on their part to obtain full and reliable information on this subject, it may be expected that these issues will finally be settled in a just and impartial manner. It is not likely that the miners will, in any event, be estopped from further operations, some plan being hit upon by which the land owners will receive reparation for damage hereafter done their property.

In consequence of the growing difficulty of obtaining a sufficiency of water for operating by the hydraulic method, a decided impetus has been given of late to drift mining in this State. All along the old channels shafts are being sunk or tunnels driven to open up this class of deposits, a large proportion of these works having been commenced within the past year or two. As it takes some time to complete these openings, not many of this class of claims have yet been brought to a productive state. Of those that have been advanced to a working point, almost the whole are making such satisfactory returns that we may safely count on an increased production from this source of 50% or 60% within the next 12 months. In this connection it may be observed that the Cranson elevator is now being employed to raise the gravel from the old channels that lie too deep to be bottomed by tunnelling, and sometimes also in cases where the tunnels run have been too high. The old plan of employing stamps to crush the cement, too hard to be dissolved in water, is also again coming into vogue, and with some chance of finally reaching a larger use than ever before. As we sometimes rewash the material that has been once and perhaps several times washed before, so do we occasionally find it expedient to re-employ methods that had fallen into partial disuse or been wholly discarded, this return to the stamp mill being an example in point.

Twenty-five years ago river bed mining was extensively engaged in, but afterwards came to be almost wholly abandoned. Now it is again becoming popular, and it would not be surprising if it should soon reach proportions never dreamed of by the early miners. We hear of preparations being made in many parts of the country to dam the rivers and by turning their waters into flumes make dry their beds, which will then be washed in sluices and made to yield up the gold they contain. While there will be quite a number of these enterprises set on foot in California the coming summer, there will probably be still more undertaken in Oregon, Idaho and Montana.

Some experiments were made last year along our rivers with steam dredges, none of which were attended with satisfactory results. Further trials are to be made with these machines this summer, the investors being under the impression that they can make them a final success.

As the gratifying results that have, in one instance, been reached in rewashing the mining debris on a large scale, will be sure to lead to further efforts of that kind, we may expect to see large quantities of this material in like manner turned to good account in a short time. Millions of tons of these rich tailings have made lodgment along the various streams on which hydraulic mining has been in progress for the past quarter of a century, and yet only last fall, in Indian canyon, Placer county, was the first well-planned effort made to utilize them on an extensive scale. As above intimated, this effort having turned out well, these gold-bearing slums will, no doubt, be attacked elsewhere, and instead of lying as heretofore a dead waste, threatening even in some instances to block up the outlet to the mines, be converted into bullion-producing factors and sources of profit. The plan of driving tunnels under these masses of tailings, for the purpose of extracting the deposits of rich gravel they are supposed to overlie, has not yet been sufficiently tested to determine its utility, none of these tunnels having yet reached their objective point. Of their ultimate success, however, the parties driving them are very sanguine.

Aside from these schemes and devices for exploring and reworking the old placers, some new deposits of this kind are constantly being brought to light. The most recent of these discoveries are the diggings found in the town of Bodie, where a considerable area of auriferous gravel has within the past month been found and which, if only there were water at hand, might be deemed a matter of moment. As it is, quite a number of men have made fair wages washing the dirt with the limited facilities within reach. The Snake River mines, though not likely to pay as largely as at one time expected, will still afford remunerative employment for several thousand men. The shallow placers recently struck in San Luis Obispo county and the beach deposits of Santa Cruz, afford employment to a not over thrifty class of miners, who would rather earn a dollar a day at gold washing than two dollars at anything else. Of the condition and prospects of vein mining throughout our Pacific States and Territories we shall speak more at length in our next issue.

Hydraulic and Drift Mining.

The only branches of placer mining in California that are now making, or that are hereafter likely to make any very large production, are the hydraulic and the drift. While the class of gold-bearing deposits to which these methods of operating are respectively adapted continue to be very extensive, hydraulic washing will soon have reached its limit of greatest expansion by reason of the entire appropriation of all the water obtainable for that purpose. Already every lake and stream within easy reach has been secured and utilized by the various companies now in the field and actively engaged in this branch of the business. Only a few sources of water supply remain to be availed of, the most of these being inconsiderable in extent, and difficult to command. With the exception of Lake Tahoe and the Blue lakes, the latter lying near the summit and the former wholly beyond the main range of the Sierra Nevada, there remain no where any large streams or bodies of water that have not been taken up and in most cases already drawn upon by these companies. As the introduction of water from Lake Tahoe into the mines lying on the westerly slope of these mountains necessitates the construction of a long and costly tunnel, some time must elapse before any water can be obtained from that source; only by an increment of storage capacity to be effected through an enlargment of the old, or the construction of new reservoirs, can these companies much augment their present water supply. For increasing the latter by the above means the facilities are in some instances excellent, while in others they are of a very limited kind.

Nearly all the self-supplying companies operating along the more central portions of the main gold belt will be able to increase their water storage from 20% to 60% by raising the dams at the outlets of their present reservoirs, as they contemplate doing, or by building new reservoirs on sites already secured for the purpose. This is the condition of things in the tier of counties extending from Mariposa to Plumas. When this work of enlarging old and building new reservoirs is accomplished, as it probably will be in the course of a few years, then this class of hydraulic mines will have reached their maximum of gravel washing, though not necessarily of bullion production, as the deeper they go the better the ground is apt to pay. Further north in Trinity and Siskiyou counties, while all the water readily available has in like manner been taken up for mining purposes, no provision has as yet been made or required for storing the same, the most of it having, in fact, thus far been suffered to run to waste; and this, not because there is in that section of the State any scarcity of ground on which it could be employed to advantage. On the contrary these counties contain immense deposits of rich gravel, the most of it so favorably situated that it can be handled readily and with decided profit.

In the northern part and about the middle of Trinity county rises a group of tall mountains, their crests reaching an elevation of 11,000 feet and holding heavy bodies of snow the year round. Circling about these mountains and skirting them on three sides is the Trinity river, a large stream kept well replenished by numerous confluents from these central snowy peaks. This river traverses the principal gold-bearing belt of this region, which, coming in from the northeast sweeps in like manner around these mountains, passing on towards the northwest; the whole forming a finely blended and perfect system of water supply, distribution and auriferous gravel, such as exists hardly anywhere else in the State. Some of the feeders of the Trinity, such as Stewart's fork, the North fork and French creek, carry large volumes of water, the whole of which can, by means of short canals, be delivered on the adjacent gravel banks under heads varying from 200 to 600 feet. Along Stewart's fork quite up in the mountains occurs a series of natural meadows, which at little expense could be converted into capacious reservoirs, greatly prolonging the working season on Buckeye ridge, Brown's mountain and other rich and extensive gravel deposits commanded by that stream. Further north in Siskiyou county there exist like opportunities for enlarging the water supply, much water there, as in Trinity, being suffered to run to waste.

But, as before remarked, along the mineral range to the south, these resources have been so nearly utilized, that we are able here to see about the limit of hydraulic mining's greatest expansion, leaving to those who would engage in placer operations only the choice of buying hydraulic properties already equipped and supplied with water, of embarking in the business in these more northern counties or else in turning their attention to the drift diggings, which, less monopolized and less developed, present in many parts of the State good openings for investment. Wherever there are hydraulic mines there also will be found drift diggings, the latter consisting of that class of deposits which, on account of the great quantity of superincumbent barren matter or for other reasons, cannot be advantageously worked by the hydraulic process.

For a long time drift mining, because of the many failures that attend it, was accounted a specially hazardous business. But of late years this has so far changed that it has come to be considered quite as safe as any other branch of mining, while it presents some advantages peculiar to itself. In the first place, it can be carried on with but little water and without regard to outlet or head, and can, therefore, be prosecuted with success where hydraulic washing would be impracticable. For plant but little outlay is required, giving it a preference with parties of small means over vein mining. Once the drift miner has reached his stratum of pay gravel it is an easy matter to keep it till worked out, and where it lies, as it usually does, in one of the ancient river channels, it is apt to hold for a long distance.

Two means are adopted for opening and working this class of deposits, one by shafts and the other by tunnels, according as conditions require. In adopting the latter method many mistakes were at first committed, the tunnels being usually driven on too high levels. Latterly these mistakes have been less frequent, have, in fact, been of rare occurrence, adding much to the success of this class of operations, a good many of which have recently been set on foot. As this branch of placer mining, by reason of its improved outlook, is beginning to attract more attention than in times past, we will in our next issue speak of several of the more prominent companies now engaged in it, some of whom have been a number of years at work, while others have but recently entered the field.

The Edison Electric Light.—Since our outside went to press with the article under the above heading, the following paragraph from a New York paper has come under our notice, which we give in justice to Mr Edison: In reply to the letter sent from this city to the Boudoir *Times*, stating that Edison's electric light was known to be a failure, Prof. Edison says the letter is a mass of misstatements, evidently made up in the interest of gas men. He showed in detail how thoroughly incorrect were the points made in the letter, and declared that his electric light is a complete success, and can be furnished at one-third the cost of gas. He expects to make the whole thing public within two months. He will burn 500 lights at Menlo Park until the stockholders are perfectly satisfied. The delay had been the want of a perfect generator of electricity, and this Prof. Edison has himself added to his inventions. It has been supposed that the lamps themselves would be very expensive. They are simply a small coil of platinum wire placed in a glass bulb. Prof. Edison says they will cost, bulb, platinum, and all, not more than $1.50 apiece. He is making his own bulbs, having picked up the art from a perambulating glassblower.

A young man named Rogers, recently from the East, while prospecting in Mud Springs township, El Dorado county, struck a pocket, from which he took out over $500 one day last week.

It is proposed to abolish capital punishment and utilize murderers as a dispensatory for the afflicted, using them up gradually in skin grafting and similar operations.

Relation of the Mono Volcanoes to the Glacial Drift.

[On the Extinct Volcanoes about Lake Mono and their Relation to the Glacial Drift. A Paper read before the Geological Section of the California Academy of Sciences by PROF. JOSEPH LECONTE.]

In 1870 and again in 1872, in company with a party of students and graduates of the University of California, I visited the Mono region. But on both occasions my attention being specially directed to the study of the ancient glaciers, I examined the volcanoes only somewhat cursorily. In 1875, with a similar perty, I again visited the same region, and this time remained longer and examined more carefully, though on account of an unfortunate accident not so long or so fully as I desired. I have put off from year to year the publication of the results of my observations, in the hope of again visiting the region and settling some doubtful points which still remained. There seems now, however, little likelihood that I shall ever be able to carry out my intention, for other questions of still greater interest have in the meantime engaged my attention. I will therefore no longer withhold my imperfect observations, hoping that they will be corrected and extended by others.

General Description of the Region—Eastern Slope of the Sierras.

As already explained in previous papers,* the general form of the Sierra is that of a great wave ready to break on its eastern side. It rises from the San Joaquin plains by a gentle slope which extends 50 or 60 miles, reaches a crest 13,000 feet high, then plunges downward by a slope so steep that it reaches the plains of Mono 6,000 feet above sea level, in five or six miles. In glacial times long, complicated glaciers with many tributaries occupied the western slope, while on the east comparatively short, simple glaciers came down in parallel streams and ran far out on the level plains and into the swollen waters of Lake Mono; which, then near 700 feet above its present level and far beyond its present limits, washed against the base of the Sierra itself. There can be no doubt that these glaciers formed icebergs which floated on the surface of the great inland sea and dropped debris over its bottom.

The Plains.

Surrounding Lake Mono and sloping imperceptibly to its surface, is a nearly level desert plain covered with volcanic sand interspersed with fragments of pumice and obsidian, and overgrown with sage-brush *(Artemisia tridentata)*. It is undoubtedly an old lake bottom, subsequently covered with volcanic ashes. The dreary prospect of this desert is relieved by the magnificent irregular Sierra-wall trenched with deep canyons; by long parallel moraine ridges stretching like arms from the mouth of each canyon, five or six miles out on the level plains, and bounding the pathways of ancient glaciers; by a fine cluster of recently extinct volcanic cones 15 to 20 in number and very perfect in shape; and finally, by the bright waters of the lake studded with picturesque islands.

Moraines.

Some of the parallel moraines which form so conspicuous a feature of the scene, especially those of Bloody canyon, I have already described†. From the top of any of the higher volcanic cones many others may be seen stretching out upon the plains. These moraines ridges average 300 to 400 feet in hight, and five to six miles in length, but some of them, especially those at the head of Rush creek are much higher. The view of glacial moraines here presented is incomparably the finest I have ever seen.

Lake.

Lake Mono is a fine sheet, 14x10 miles in extent. There being no outlet, the waters are of course saline. It is essentially a strong solution of sodium carbonate, with smaller proportions of lime carbonate, common salt and borax. To the taste it is simply a concentrated solution of carbonate of soda. While camping on its margin we found its powerful detergent property very useful in clothes-washing. The mineral contents are probably partly the concentrated leachings from the volcanic rocks which cover the whole plain—the alkaline silicates of these rocks being changed into alkaline carbonates by carbonic acid of the air—and partly contributed by springs which issue in many places from the bottom and around the margins of the lake, and were probably more numerous and active in former times. In any case the lake waters are now but the concentrated residues of a much larger body of water, as plainly shown by the terraces to be presently described. During the process of concentration the less soluble lime-carbonate has been deposited in strange irregular masses of calcareous tufa. These curious fungoid and coralloid masses, some of them six to ten feet in hight, stand up thickly on the level shores, and in the shallow marginal waters of the lake. At a distance they look like the half submerged stumps of a forest of gigantic trees. This carbonate of lime deposit is evidently identical with the thinolite deposits described by King‡ as occurring in such immense quantities about the residual lakes of the Nevada basin farther north, and which as he shows is a pseudomorph of carbonate of lime after gaylussite. The condition under which the deposits took place about Mono are probably, however, slightly different from those in Nevada, and I believe throw much light on the general question of thinolite deposits. It deserves careful study and we hope to take it up in a subsequent paper. Farther east, near Columbus, Nevada, in the region of the dried-up lakes left at the extreme southern extension of King's ancient Lake *Lahontan*, occur remarkable deposits of ulexite (soda lime borate) which also deserves separate study.

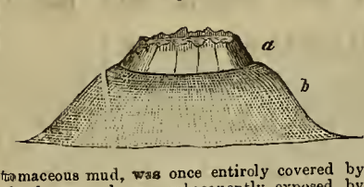
Terraces.

I have already mentioned the terraces about Lake Mono. Several of these are very distinct, and traceable all around the lake, but they are seen in greatest number and most distinctly on the west side where the lake approaches the Sierra and the hills rise abruptly from the lake-level. Five or six may be counted, rising one above the other like level benches, the highest being, according to Whitney, 680 feet high. These terraces are undoubtedly the marks of old lake levels, and show not only a former greater depth, but also a much greater extent of the lake water. The highest level traced about the lake would reach the moraines at the foot of the Sierra, extend beyond the plains on every side, and enclose an area many times greater that the present lake area. There can be no doubt, therefore, that the great glaciers of that time ran into the lake and formed icebergs.

Islands.

Near the center of the lake there is a group of volcanic islands in direct line with the group of volcanic cones on the plains to the south, and doubtless a continuation of the same line of volcanic activity. The largest of these islands is about two and a half miles long, a mile wide and about 300 feet high. It is composed mainly of extremely fine whitish material beautifully and very finely laminated, the differently colored laminæ being very distinct and scarcely thicker than a card board. This material is spoken of by Whitney* as volcanic ashes. Under the microscope it proves to be composed wholly of *diatom shells* with only an occasional grain of sharp sand. There is no doubt, therefore, that it was deposited very slowly in calm waters in the middle of the lake and beyond the reach of detritus. The stratification is mostly horizontal. Only in two or three places where the deeper strata are exposed on the cliffs by the action of waves, I observed a slight dip, and in one place a gentle but distinct *anti-cline*, showing a quiet upheaval of the whole mass, as I think, by volcanic forces. In the highest parts of the island the soft horizontally laminated earth is sculptured by erosion into sharp pinnacles and turrets, like bad land structure on a small scale. On the eastern portion of the island a considerable area of black basaltic rock is exposed, but this is no where more than 50 feet high. Where the diatomaceous earth comes in contact with the basalt, the former always overlies the latter in undisturbed horizontal layers. I conclude, therefore, that the basalt preceded the formation of the diatomaceous mud, was once entirely covered by the latter and was subsequently exposed by erosion.

Fig. 1.



Steam and boiling water issue in many places in this rocky portion of the island and in the shallow water in the vicinity. I observed, also, in the earthy portion crater-like depressions containing a little saline water, which were probably produced by similar fumarole action now extinct. According to Whitney (p. 453), two distinct true craters occur in the basalt on the northeast portion of the island, but these I did not see.

The other, and much smaller islands, I did not have time to visit, but according to Whitney they are wholly basaltic, and the largest of them is 300 feet high and is a well-defined volcanic cone.

The general conclusion at which I arrived from my examination of the largest island, was that the basaltic portion was first formed at the bottom of the lake, or else subsequently submerged; then the diatomaceous mud was deposited covering it up completely; then the fine mud bottom was raised into an anti-cline and exposed as an island by the fall of the lake level; and finally erosion sculptured the whole, and in part exposed the underlying basalt.

Volcanoes on the Plain.

We have already alluded to a conspicuous group of volcanic cones situated on the level plain to the south of the lake. These are 20 or 30 in number, extending in a line, from near the margin of the lake, to a distance of 10 or 15 miles, and vary in hight from 200 to 2,700 feet above the plain. Partly from the recency of their extinction and partly from small rainfall of the region, they are, some of them, as perfect in form as if they were still active. A good general view of these is given by Whitney in his account of this region. The typical form of the more perfect is shown in Fig. 1, which, though intended only as a diagram, is yet a tolerably correct outline of the highest and most perfect. The upper part, *a*, is a light-colored pumiceous lava, and the lower part, *b*, is covered with sand of the same.

In many cases I observed a very perfect cone-and-rampart structure, such as is known to be produced by great eruptions followed by smaller ones; or, perhaps, in some cases by an engulfment of the crater into the base of the cone. The most perfect example of this kind is found in a small and easily accessible cone not far from the lake. Fig. 2 is an ideal section and half perspective view of this cone. It consists of a low sand cone about 200 feet high with a perfect circular crater 1½ or 2 miles in circumference, from the center of which rises a trachytic cone and crater of much smaller dimensions to about the same hight. From the shattered condition of the inner cone Mr. Muir suggested to me the possibility of the engulfment of the upper rocky portion into the lower sandy portion of a once much higher cone. But in many other cases observed this explanation is evidently untenable; for in some cases we found several small cones surrounded by one rampart. Such could only be found by successive eruptions.

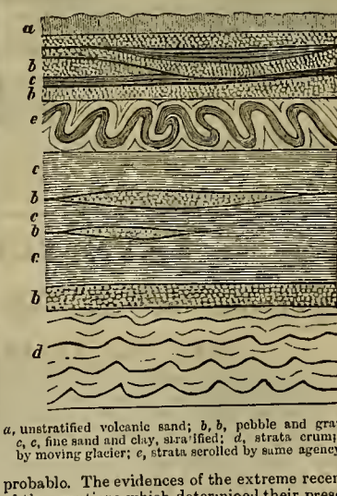
Fig. 2.

The material erupted by these volcanoes are, in some cases, basalt, but by far the largest amount consists of feldspathic elags, pumice and pumiceous sands and ashes. The whole plains of Mono are covered to a depth of many feet with a nearly white volcanic sand mingled with fragments of pumice and obsidian.

Age of the Mono Volcanoes.

There is abundant evidence that these volcanoes have been active, and, therefore, that they assumed their present forms since the epoch of great separate glaciers in this region (Champlain). Whether they also existed and erupted previously, is perhaps doubtful, though probable. The evidences of the extreme recency of the eruptions which determined their present forms are as follows:

Fig. 3.



a, unstratified volcanic sand; *b, b*, pebble and gravel; *c, c*, fine sand and clay, stratified; *d*, strata crumpled by moving glacier; *e*, strata scrolled by same agency.

1. We have already shown the splendid scale on which glaciers were once developed in this region. We have already given reasons for thinking that they ran down the Sierra, out on the plains and into the lake and produced icebergs there. It is impossible that the volcanic cones, if they then existed, could have escaped the powerful action of ice and the equally powerful action of other meteoric agencies, so characteristic of that epoch which must have entirely destroyed their form. The remarkable perfection of their conical forms and of their craters is, therefore, strongly presumptive, if not demonstrative, of the fact of their eruption since the disappearance of the glaciers.

2. All the streams which run from the Sierra into Lake Mono, cut into the level plains 100 to 150 feet deep. Fine sections of the materials of the plains are thus exposed. Fig. 3 is the upper portion of such a section about 80 feet perpendicular. The lower portion of the cliff, being covered up by talus, is not represented. It is seen that nearly the whole is an ordinary modified drift composed of irregularly stratified sands and clays, *cc*, intermingled with layers of pebbles and gravel, *bb*. But there are other parts that deserve more special notice. The stratum, *e*, is a fine light-colored clay through which runs a deep chocolate-brown lamina scrolled in the most complex and beautiful pattern. The strata, *d*, is also strongly crumpled. This crumpling and scrolling of the strata could have been produced only by a glacier advancing on a bed of stratified clay, or else by the pushing of icebergs on a stratified lake bottom. I suppose the whole formation, except *a*, to have been produced by an alternately advancing and retreating glacier, now retreating and dropping material to be carried and deposited by the rivers which flowed from its snout, now advancing and crumpling the finer material of the lake bottom. It may be difficult to explain the details of the process, but I think it will not be doubted that the whole is a distinctly marked drift deposit. Many other similar sections were observed; some of which were 150 feet thick.

Now covering, everywhere, this undoubted glacial material is found a layer of loose unstratified volcanic sand and pumice, *a*, which has evidently never been touched by the action of water. It is a pure eolian drift. In the section it is about three feet thick; but it is really much thicker, as it thins off on the margin of the perpendicular cliff by falling, and thus contributes to the talus at its base. It is evident that the whole material of the section was deposited during glacial times, except *a*, which has drifted over the bared lake bottom since that time. But judging from the immense quantity of this loose material, covering as it does the whole plain many feet deep, it seems impossible that it is the mere result of disintegration of the volcanic cones in recent times. I suppose, therefore, that it is the result of sand and ash eruptions since the recession of the lake waters.

3. We have already described the material of the largest island as being composed wholly, except a portion of the eastern part, of a fine infusorial earth, horizontally stratified with laminæ of slightly different colors, so thin as to give specimens an almost agate-like beauty. This material was evidently deposited in the middle and deepest part of the lake, beyond the reach of sediments, at a time when the place of the island was still a lake bottom. Now, that this occurred during or after the epoch of great glaciers, is demonstrated by the fact that scattered sparsely through the fine laminated material, and lying on its surface, having been washed out by erosion, I found many boulders, both worn and angular, of Sierra granite and slate, and also of obsidian. These could have been brought there only by the agency of floating ice, either as icebergs or as shore ice. If by icebergs, of course during the epoch of great glaciers; if by shore ice, either during that time or still later, for manifestly the boulders were brought down to the shore from the Sierra during that time. It is evident, therefore, that the stratified mud was formed and the boulders were dropped during the period of great glaciers or later. But still later the island itself was upheaved by volcanic action, as shown by the anticlinal position of the strata at the base and by the solfataric action still going on. The formation of this island I suppose to have been coincident with the last eruptions of the volcanoes on the plains.

4. Within the craters of several of the volcanic cones on the plains I found pebbles and angular fragments of granite of a peculiar reddish color, from the presence of a rose-colored feldspar. Whitney observed the same and accounts for them in the following manner: They could not, he thinks, have been brought by glaciers or by water, for this is inconsistent with the perfect shape of the cones. He rightly concludes, therefore, that they must have been ejected from the volcanoes. But if so, he says: "They must have been torn off from the underlying granite, through which the eruptive matter has forced its way, as is seen everywhere in the Sierra."* On the contrary, I account for them in a wholly different way: The fragments which I saw were some of them angular it is true, but most of them were well worn pebbles. There is not the slightest doubt that these were pebbles of the drift layer, which everywhere underlies the loose sand of the plains. The eruptive forces broke through this drift layer and the ejected pebbles fell back into the crater. They demonstrate that the cones and craters, where they are found, not only erupted, but were wholly formed after the epoch of the pebble drift.

I think, therefore, there can be no doubt that all of these volcanoes erupted, and many of them were wholly formed, after the epoch of great glaciers (champlain). Whether any of them preceded that epoch is doubtful. I have never seen any undoubted evidence that they did. If the boulders found in the island were carried there by icebergs, then volcanic action preceded the epoch of icebergs, for many of the fragments are volcanic; but they may have been carried by shore ice at a later time. Again: I believe the rocky part of the island is older than its sedimentary part; for the latter seems to have been deposited on the former. If the sedimentation was champlain, then the rocky part was probably pre-glacial; but the sedimentation may have been later.

Sequence of Events.

Assuming that the island strata belong to the epoch of great glaciers, then the order of events was something like this:

1. Volcanic eruptions on the plains producing obsidian, fragments of which were afterwards carried by ice and dropped in mid-lake. At the

CAUTION

To Hydraulic Miners.

The public generally and Hydraulic Miners especially are hereby notified that any parties making or using the contrivance known as the HOSKIN DEFLECTOR will be prosecuted to the full extent of the law, said machine having been declared by the U. S. Circuit Court an infringement upon my patent, the

Bloomfield Deflecting Nozzle.

The public are also cautioned against using the Hoskin Deflector because of its danger to life and limb, this device having already occasioned several deaths and other serious accidents. The BLOOMFIELD DEFLECTOR is entirely safe, its two and a half years use without accident, as well as its construction, proves it to be a reliable contrivance.

Any parties wishing to purchase the right to use these Deflectors can do so by applying to the undersigned,

HENRY C. PERKINS,

North Bloomfield, Nevada Co., Cal., October 1st, 1878.

ESTABLISHED 1867.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

—o—

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

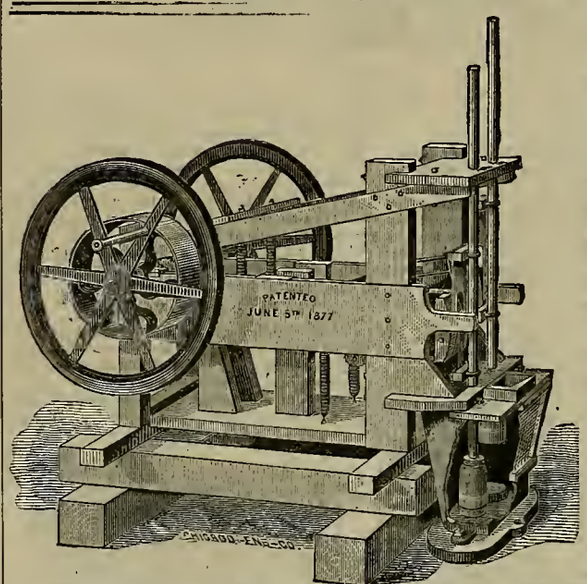
ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street, - - San Francisco, Cal.

THE POOR MAN'S PROSPECTING

HAND OR POWER QUARTZ STAMP MILL.



Two men can operate it all day. It is simple, efficient and durable. The force of the blow can be changed so as to strike a light or a very heavy blow readily. Two men can work this Mill to its full capacity, and do the work as well as can be done with any of the old-style heavy Stamp Mills. An inspection of this Machine will convince any practical person that it is the most perfect QUARTZ STAMP MILL ever produced in this or any other country. A large number of old practical Miners have seen it, and they all say it is a perfect Hand Stamp Mill. We put on a band pulley, so it can be run with power. The cut is a correct representation of C. EATON'S Patent LATELY PERFECTED MILL.

— FOR —

PROSPECTING

IT IS SIMPLY

Perfection!

When power is used, each Stamp will strike 150 blows per minute. The force of the blow in comparison to the face of the stamp (4½ inches) is greater than that of any of the heavy power Stamps. Stamps and Dies cast on Chill. These Machines are well and thoroughly made, nothing about them to get out of order. They are put together with bolts. Can be taken apart readily, so as to be convenient to pack on a mule's back. The whole machine weighs about 1,300 pounds. The heaviest piece weighs 200 lbs. These Mills will do more work (according to money invested) than any of the old heavy Stamp Mills. For sale at AMES' STEAM ENGINE DEPOT, 14 S. Canal street, Chicago, Illinois. Net Cash Price, $150. COLLINS EATON.

SAVE YOUR GOLD!

—o—

Highly Important to Miners and Quartz Mill Men!

SILVER PLATED AMALGAMATING PLATES.

The best process yet discovered for saving fine or float gold. Extensively used with great success in gravel and placer mining in various parts of the Pacific Coast. Over five hundred orders have been filled, and the demand is constantly increasing. A large number of these Plates were sent to Snake River mines, Idaho, last year, and a great many orders are being filled for them this season. Circulars containing full instructions for working these Plates sent with each order. Old Mining Plates bought or taken in exchange for new Silver Plated Plates, and full value allowed. Gold extracted from old Plates at a moderate cost by a new and economical process. Old Plates (which often contain a surplus of gold above the cost of plating) can be re-plated.

With the most extensive facilities on the Pacific Coast, orders can be filled very promptly and satisfaction guaranteed.

Mining Men and the public generally are cautioned against unprincipled and irresponsible parties traveling through the country, endeavoring to secure orders for very inferior qualities of Silver Plated Mining Plates.

Barlow J. Smith, M.D.

Consulting Physician,

Professor of Phrenology and Mental Hygiene.

Proprietor of the Smithsonian Medical and Phrenological Institute, 635 California Street, above Kearny.

This Institute, by combining medical hygiene with the various Water Cure treatments and the most powerful Electrized Horseshoe Magnet in the world, claims to cure speedily and permanently all forms of acute or chronic nervo-vital derangements, Brain, Spinal and Heart diseases, St. Vitus Dance, Palsy, Epilepsy and all Rheumatic, Liver and Kidney troubles. The institution has for the past 20 years made a specialty of treating all forms of weaknesses and diseases peculiar to males and females. By the use of hygieale remedies and electro-motorpathy the worst forms of impotency and seminal weakness in males and sterility in females are speedily and permanently overcome. Hygienic board, with or without rooms. Terms moderate. Electro-thermal, Russo-Turkish and Medicated Bathe given daily.

Mrs. Dr. Smith as Matron has charge of the female bathing department.

DR. SMITH has practiced Phrenology the past 30 years, and during the last 20 years has been constantly using the science connected with Physiognomy, in examining or diagnosing disease in this city, and claims to have made discoveries in the SCIENCE of Phrenology that enables him, by an examination of the head, even blindfolded, to determine the disease to which the person is constitutionally subject, or whether the disease at the time afflicting the person, is the result of accident or hereditary weakness; whether CONSUMPTIVE, DYSPEPTIC, RHEUMATIC, APOPLECTIC, NEURALGIC, LEUCORRHŒAL, or SEMINAL. Especially does the form of the head indicate the strength of the uterine, genital or reproductive system. The head is also an index of the natural strength of the lungs, heart, stomach, liver, kidneys, spleen, back or vertebra, and it determines the power of the system in warding off and overcoming disease of all kinds.

Ladies or gentlemen, desirous of obtaining a thorough and correct Phrenological examinations with Fowler and Wells' charts, will meet with a respectful reception at his consulting rooms. Parties can depend upon a reliable delineation of the character of their intimate male or female friends, by presenting a clearly defined photograph.

Phrenological or Physiognomical examinations without charts, $1.50; with charts, from $2 to $3.

INVITATION TO INVALIDS

And all persons who are in any way out of health, who desire to know the nature and causes of their disease, may avail themselves of an examination through phrenology in regard to health free of charge, between the hours of 9 A. M. and 8 P. M. Sundays from 9 A. M. to 12 M.

PALACE RESTAURANT

Ingersoll Rock Drills.

In use in the largest and best Mines of the Coast.

HAS AUTOMATIC FEED.

Has less Repairs.

Is Lighter and more Easily Adjusted than any other Drill.

Our DRY AIR COMPRESSORS are the most Economical Compressors in the Market:

MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.

The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

San Lorenzo, December 6th, 1877.

Messrs. Dewey & Co.—*Gentlemen:* I received the Letters Patent for my invention on the 6th inst., and beg to thank you for the gentlemanly and business-like manner in which you have dealt with me from the beginning of my application. I shall always feel it a pleasure to recommend you to all I come in contact with who need Letters Patent. Respectfully, Wm. Dale.

[Continued from page 269.]

in to handle the influx of water. The drift north on the 2000 level is making six ft per day in a favorable vein formation, through which seeps a little water. A drift has been started south from the Sierra Nevada winze, 2300 level, toward the Ophir incline. It is making three ft per day.

JUSTICE.—The south lateral drift, 1550 level, continues to cut favorable vein matter, containing ore in places. The upper workings in the Waller Defeat ground are continued as usual and some ore is being extracted. Some high-grade ore has recently been encountered in these workings, and the outlook there is very favorable.

CALIFORNIA.—All the work being done in developing the mine is joint with Con. Virginia. The west drift, 850 level, is in porphyry, the face 60 ft from the Con. Virginia shaft. The west drift, 2150 level, is in 440 ft in fine vein matter. Sinking at the C. & C. shaft is being continued at the rate of three ft per day for a sump.

SILVER HILL.—The drift south from the Waller Defeat workings has been turned toward the east somewhat and shows unmistakable signs of cutting the vein and encountering pay ore. The ledge in this mine has been found to be 600 ft wide. There are places where it shows signs of contracting.

OPHIR.—The improvement in the stopes on the 6th floor above the 2000 level going south continues, and the vein is now over 10 ft wide, and swinging around toward the west. The ore is of excellent quality. The joint Mexican upraise, 2100 level, is making two ft per day, and will reach the 2000 level in a short time and greatly improve ventilation.

GOULD & CURRY.—The bulkheads on the 1800 and 1900 levels have been completed. The joint east drift, 1700 level, is being pushed at the rate of four ft per day in a mixture of clay and porphyry, carrying some water. The bottom of the shaft is now kept freed from water, ready for the resumption of sinking.

JULIA CON.—The 2000 level has been freed of water, but the heat is so great that but little can be accomplished toward cleaning it up and repairing it. Some 50 or 60 ft of double drift are found to be badly caved, the timbers being broken. The flow of water from the mine is now 11 miners' inches. It will decrease to seven inches.

MEXICAN.—The joint Union upraise from the 2000 level is making three ft per day in a vein formation carrying some water. The joint Ophir upraise from the 2100 level will soon connect with the 2000 level north drift and greatly improve ventilation.

SUTRO TUNNEL.—Six hundred men are employed in and about the construction of the sub-drain of the tunnel, and the work is making good progress. There has not yet been an agreement as to terms for raising debris at the Comstock end.

WARD.—Sinking, the shaft being down 1,880 ft. The flow of water continues strong, but is rapidly decreasing.

YELLOW JACKET.—Owing to breaking of a spur wheel, nothing is being done on the 2400 level of the old workings at present. Sinking at the new shaft is going on as usual and making rapid progress. Total depth, 2,445 ft.

BULLION.—The crossent east, 2150 level, is averaging five ft per day, and is in 152 ft from the lateral drift. It is still cutting clay, porphyry and quartz.

NORTH BONANZA AND FLOWERY.—The new engine is ready for use. Some more water has been encountered on the second level, but the flow is rapidly decreasing, showing it to be only a reservoir which has been tapped.

NORTH CON. VIRGINIA.—One of the long-looked-for cables has arrived and has been attached to the big engine. The repairs to the shaft will probably be completed during the current week.

CON. IMPERIAL.—The south drift, 2600 level, is connected with the old workings, 2400 level, of the Yellow Jacket, and an improved ventilation has commenced.

ALTA.—The joint three-compartment incline winze is rapidly approaching the 1750 level, which it will reach by the last of the week. The drift north, 1550 level, is being continued.

UTAH.—The main incline is now making excellent progress, the bottom 435 ft below the 1350 level. The new engines give the best of satisfaction.

BEST & BELCHER.—The joint east drift, 1700 level, has its face 790 ft east of the lateral drift, and in a mixture of clay and porphyry.

ANDES.—The west cross drift, 350 level, has passed through eight ft of hard rock, but is again in a mixture of clay, porphyry and quartz, without any sign of the west wall.

CROWN POINT.—Crosscutting on the 2500 level in two places. No. 1 is joint with Belcher, and No. 2 is 127 ft further north. The latter is in 50 ft, but neither crosscut is in the ledge yet.

EXCHEQUER.—Three ft per day are being added to the length of the north drift, 2400 level; total length, 375 ft. Its face is still in soft vein porphyry carrying stringers of quartz and some water.

OVERMAN.—Still running north on the 1600 level and sinking the winze below that level. No change of formation to note. The O & C shaft has reached the 600 level and is going on down.

EUREKA DISTRICT.

RICH MINE.—*Sentinel*, April 21: The Silver Gate is owned by Mr. D. J. J. McLaughlin, of Ruby Hill, and has been worked by him at intervals for several years. There is an incline down about 120 ft. The ledge is well defined and the walls perfect. It is estimated that there are 30 tons of ore on the dump. About five tons of it is recognized as first-class, and this will work $300 per ton. The balance is counted on as being good for $250 to $400 per ton. Mr. McLaughlin will ship the second-class ore in a few days to the Richmond for reduction. The mine is holding out splendidly as far as work has progressed, and the indications are good that the ledge will continue down indefinitely. Considerable high-grade ore has been left behind on either side of the incline.

COLORADO.

LEADVILLE.—Cor. Denver *Tribune*, April 16: The past week has been prolific in big strikes. At least half a dozen new developments have been made, some of which promise exceedingly well. Most of these are in the new region known as "Evans." There are three gulches to the north and east of Leadville, known as Big Evans, Little Evans, and South Evans. These gulches lie between the lower ranges of hills that skirt Bald mountain, and it is upon these hills that the new prospects have been opened up. But few holes were worked in this new locality previous to January, so that but little was known of the character of the country. Active prospecting has been carried on since that time, and it is now definitely ascertained that large bodies of the best mineral, similar in character and equal in value to the Fryer hill discoveries, exist all along that region. As yet, however, none of the newly-discovered holes have been worked sufficiently to demonstrate the extent of the deposit. In many of the new holes the indications are as good as any about Leadville. Scarcely a foot of land can be found there now that is not covered by a miner's claim. Some of these new finds are held at high figures, while others can be purchased at moderate prices. Among those in which mineral has been found in fair quantities are the Sarsfield, Little Katie, Little Morgan, Flower of Edinburgh, Little Bonanza, and Yaukee Boy. The first of these has been offered for $35,000, and is believed to be well worth the price asked. Some excellent prospect holes in which mineral has not been reached, but where there are first-class indications, lie all along these gulches, and no doubt rich returns will be reaped from them during the next 30 days. The George Washington, Mollie, Emma, Little Maud No. 2, Mountain Queen, and Olivia are among the most promising. Most of these shafts are sunk from 40 to 65 ft, the lower ones having the best indications of being near paying mineral. Probably 200 men have started out to prospect within the last 10 days, a large majority of whom have located their claims in the last mentioned region. Some have gone to Ten Mile and Kokomo, and still others to Eagle river, about 20 miles to the west of Ten Mile. The last named locality is spoken of very highly by parties who were in there during the latter part of last season, and considerable interest is being manifested among old prospectors, who are leaving for the new section by every stage.

Relation of the Mono Volcanoes to the Glacial Drift.

Continued from page 273.

same time also, the basaltic part of the island was formed.

2. Then followed the period of great glaciers and flooded lakes or champlain epoch. The lake was near 700 feet higher than now. Its waters covered the whole plains and washed against the Sierra; and glaciers from this range ran far into the lake and formed icebergs, which floated on its surface and dropped rock fragments on its fine mud bottom.

3. Volcanic forces acting quietly like the solfataros and fumaroles still existing, heaved up the stratified mud bottom of the mid-lake into a gentle mound with quaqua versal dip of the strata, but not rising to the surface. Coincident with this were the eruptions of the plain's volcanoes.

4. The lake then dried away gradually to its present level, leaving the terraces as its old flood marks and exposing the rounded mud island; and erosive agents then sculptured this to its present turreted form, and cut away its margin to its present limits and exposed the mud-covered, older basaltic part.

Lake Rising Again.

The existence of salt and alkaline lakes show an extreme dryness of climate; but the climate of the desert region has not always been dry. During the champlain epoch, the interior plains were covered with immense sheets of water, of which the present saline lakes are the isolated residues. Gilbert has shown that at that time Great Salt lake contained 400 times as much water as now, and that it drained northward through the Snake and Columbia rivers into the Pacific ocean. King has shown that the Nevada basin was at the same time occupied by a vast, irregular sheet of nearly equal extent stretching southward as far as Columbus, Nevada. Pyramid, Winnemucca, Carson, Humboldt and Walker lakes are the concentrated residues of this great lake. Lake Mono also, we have seen, at the same time, was a great sheet of water, whether connected with the other or not is not known. There has been, therefore, an increasing dryness of climate in that region since the champlain. Is it still progressing, or has it reached its maximum? An important question for the Pacific States.

From my observations on Lake Mono, I have no doubt that its level at the time of my visit was rising, and had been rising for 10 or 15 years. The evidence is as follows: Around the margins of the lake I found everywhere old fences of sheep corrals and old trails submerged many feet deep. While visiting the island I found the vegetation of the island, sage brush (*Artemesia tridentata*) and grease wood (*Sarcobatus vermiculatus*), submerged in eight feet of water, and of course killed. Residents about the lake state that the waters have risen 10 or 12 feet in 10 or 15 years. I might be disposed to doubt these observations if the same phenomena had not been observed in other lakes in the same dry region. Salt lake is known to have risen 14 feet in 25 years and submerged large tracts on its flat margins, and the water, by analysis, is far less salt than formerly. Pyramid lake, according to King, has risen nine feet, and Winnemucca lake 22 feet in only four years (1867-1871). The same is said to be true of Walker lake and of Owen lake.

The cause of this is evidently increase of rainfall and snowfall, chiefly the latter. In this connection it may be well to mention an additional evidence of increasing snowfall in the Sierra. I have in a previous paper† drawn attention to a moving snow-field, or rather an imperfect *glacier*, occupying the great cirque at the top of Mt. Lyell—the feeble remnant of the great Tuolumne glacier of glacial times. At the foot of this *glacieret* there is as perfect a terminal moraine as ever was seen. It is a crescentic pile of rock fragments 20 feet high, 50 feet wide at base and about a mile long. The fragments were brought down by the moving ice from the vertical cliffs of the cirque. Many similar fragments are seen lying on the glacier on their way to the moraine, and in various stages of advance. Now not only does this moraine show no signs of being left by a *retreating* glacier, but on the contrary I think it shows signs that the ice is *advancing*. For the snout of the glacieret is not only pressed hard against the moraine, but the outer slope of the moraine, when I saw it, 1872, was just at the *limit of stability*—the least disturbance caused the fragments to roll down. It would seem therefore that the moraine is being pushed slowly forward. Whether the same is true still I know not.*

King, in his recent volume on systematic geology already referred to, has drawn attention to still another evidence of snow advance in the high Sierra. According to him, above the timber belt, there is a comparatively bare region of 1,000 feet vertical, on which for ages there has been too much winter snow to allow the growth of timber. In the timber region bordering the bare region there are many trees which have 250 annual rings. These trees have therefore been growing securely for 250 years. But since 1860 the snow has so far advanced upon the timber region that these great trees are being destroyed by avalanches. It would seem, therefore, that not only has there been recent advance, but that it is the first advance for 250 years.

The rise of the lakes in the desert region is therefore undoubtedly the result of a climatic cycle. But whether the cycle be a long or a short one; whether it be a geological cycle of increasing snowfall—a turn of the cycle of dryness which, commencing after the champlain epoch, culminated in the present arid condition of the desert region; or whether it be only a climatic fluctuation of short duration, and of which therefore geology takes no account—such for instance as may be supposed to be connected with the sun-spot cycle, it is impossible with certainty to determine without observations extending through much longer periods of time. I have hitherto been disposed to think the latter more probable, but King's observations on destruction of trees by avalanches would seem to point to the probability of a long cycle.

Berkeley, Cal., March 1st, 1879.

† *American Journal*, 3d Series, Vol. V., p. 325.

* King in his recent volume on "Systematic Geology of the 40th Parallel," p. 477, says that all Mr. Muir's living glaciers of the Sierra are only moving snow-fields well known to the California surveyors. He then quotes Agassiz defining the distinction between such moving neves or snowfields and true glaciers. This distinction according to Agassiz, consists in the ability to bear rock fragments on its bosom and thus form a moraine. Now it is but justice to Mr. Muir to say that the ice in the Lyell cirque does bear large rock fragments on its surface, and accumulates them at its lower limit as a perfect terminal moraine. Recognizing, however, the fact that this ice mass does not emerge from its native cirque, I have, in my paper on "Ancient Glaciers of the Sierra" (*American Journal*, Vol. V., p. 325,) called it a *glacieret*.

214,321.—AIR VALVE—J. M. Scott, S. F.
214,415.—OAT SEPARATORS—Jas. Magone, Canyon City, Oregon.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Boston Money and Mariposa Mines.

A Boston company has just purchased the Baltimore quartz mine—sometimes called No. 9—situated near Hornitos, Mariposa county. This property was formerly owned by a small company of miners who had been working it in a limited way, extracting and milling a few tons of ore daily. The present owners will at once erect a 20-stamp mill and proceed to open up the lode, which is large and well-formed, in a thorough and systematic way. The ore is free milling and of fair grade, assaying from $10 to $12 per ton, and it is expected that it will yield under the stamps from $8 to $10. The cost of mining and milling is estimated at $3.50 per ton. There is a good body of ore already exposed in the mine, and little fear is entertained but there will be a sufficiency to keep the new mill steadily and profitably employed. This claim lies in a good neighborhood, being near the Washington and other productive mines, some of which have been worked with handsome profit for years. Into the new mill, which will be run by a combination of steam and water, there will be introduced every method and device calculated to economize expenses and insure a close working of the ore. This property was bought on the recommendation of J. S. Phillips of this city, who will exercise a general supervision over it hereafter. This gentleman has so far been fortunate in making choice of mining properties for Eastern investors, and it is to be hoped results will prove that his judgment has not been at fault in the present selection.

Bullion Shipments.

Since our last issue, we have noticed the following bullion shipments:

Martin White, April 13th, $8,089 78; Northern Belle, April 12th, $4,241.03; Highbridge, April 15th, $4,700; Hillside, April 16th, $4,900; Alexander, April 18th, $8,565 85; Con. Virginia, April 19th, $25,613.62; Calfornia, April 19th, $50,650.86; Northern Belle, April 16th, $3,257.41; Hillside, April 20th, $5,300; Martin White, April 16th, $6,250; Grand Prize, April 21st, $12,500; Indepeudence, April 21st, $5,700; Paradise Valley, April 18th, $5,204.34; Christy, April 21st, $6,208.

THE Stevenot Fine Gold amalgamator which we recently illustrated, has been running in this city this week, so that those interested might see it at work. The machine is very simple in construction and operation, and costs $150, a great deal less than any in the market. It may be used in connection with stamps or crushers, and is well adapted for tailings also. Several of these machines are now being made here for California mines.

AN ENGINEER, favorably known in the East, desirous of settling in California, seeks position as Superintendent or Chief Draughtsman. Competent to design stationary, marine, locomotive, mill work, sugar and hydraulic machinery. Speaks Spanish. Unexceptional references. Address EXPERT, this office.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Mount Jefferson Milling and Mining Company.

—Location of principal place of business, San Francisco, California. Location of works, Garrote Mining District, Tuolumne County, California.

Notice is hereby given, that at a meeting of the Directors held on the 21st day of March, 1879, an assessment (No. 6) of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the Company, Room 6, No. 318 Pine street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the 2d day of May, 1879, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Tuesday, the 27th day of May, 1879, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

R. N. VAN BRUNT, Secretary.

Office, Room 6, No. 318 Pine Street, San Francisco, Cal.

California and Oregon Land Company.

—Location of principal place of business, San Francisco, California. Location of Works, State of Oregon.

NOTICE.—There is delinquent upon the following described stock, on account of assessment (No. 2) levied on the first day of March, A. D., 1879, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Allen, J O	130	400	$160 00
Pond, E B	129	50	20 00
Woodsum, O P	106	100	40 00
Woodsum, O P	107	100	40 00
Woodsum, O P	108	100	40 00
Woodsum, O P	109	100	40 00

And in accordance with law, and an order of the Board of Directors, made on the first day of March, 1879, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the Company, on Saturday, the tenth day of May, A. D., 1879, at the hour of two o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

R. N. VAN BRUNT, Secretary.

Office, Room 6, No. 318 Pine street, San Francisco.

Cherokee Flat Blue Gravel Company.—

Location of principal place of business, San Francisco, California. Location of Works, Cherokee Flat, Butte County, California.

Notice is hereby given, that at a meeting of the Directors, held on the tenth day of April, A. D., 1879, an assessment (No. 41), of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, in the Secretary at the office of the company.

Any stock upon which this assessment shall remain unpaid on the twelfth day of May, 1879, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Tuesday, the tenth day of June, A. D., 1879, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

R. N VAN BRUNT, Secretary.

Office, Room 6, No. 318 Pine street, San Francisco, Cal.

Rocky Point Mining Company.—Location

of principal place of business, San Francisco, California. Location of works, Placer county, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 17th day of April, 1879, an assessment (No. 1) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin to the Secretary, at the office of the Company, No. 314 Bush street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 20th day of May, 1879, will be delinquent, and advertised for sale at auction; and unless payment is made before, will be sold on Monday, the 16th day of June, 1879, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Directors.

T. L. BIBBINS, Secretary.

Office, 314 Bush Street, San Francisco, Cal.

Summit Mining Company.—Location of

Principal place of business, San Francisco, California. Location of works, Mineral Point Mining District, Plumas County, Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 7), levied on the 4th day of February, A. D., 1879, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Byers, W T	38	700	35 00
Edwards, J E	39	700	35 00
Gautier, Gustave	156	200	10 00
Kellogg, H W	46	1000	50 00
Lehmann, C, Trustee	200	200	10 00
Lehmann, C, Trustee	207	200	10 00
Turner, J W	65	200	10 00
Thompson, R	24	1200	60 00

And in accordance with law, and an order of the Board of Directors, made on the Fourth day of February, A. D., 1879, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, No. 318 Pine street, Room 6, San Francisco, California, on Tuesday, the Eighth day of April, A. D., 1879, at the hour of three o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

R. N. VAN BRUNT, Sec'y.

Office, Room 6, No. 318 Pine Street, San Francisco, Cal.

POSTPONEMENT.—The sale of delinquent stock of the above named Company is hereby postponed until Tuesday, the Sixth day of May, 1879, at the same hour and place. By order of the Board of Directors.

R. N VAN BRUNT, Secretary.

Office, Room 6, No. 318 Pine street, San Francisco.

Mines and Works of Almaden.

Translated from "Annales des Mines"

By S. B. CHRISTY.

Full geological description of this famous Quicksilver Mine, illustrated by maps and plans of the works. Complete description of the Quicksilver Furnaces and Condensers, etc 48 pages octavo—paper cover—price (postpaid) 50 Cts. Published and sold by DEWEY & CO., 202 Sansome Street, S. F.

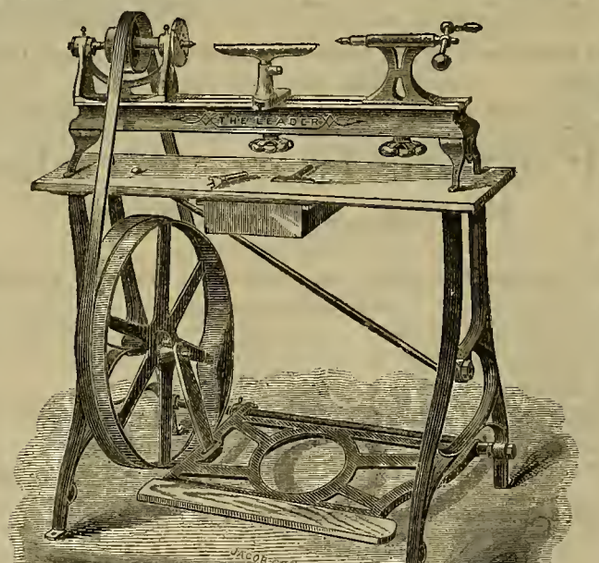
Mill and Mining Machinery Of All Kinds For Sale by BERRY & PLACE

At the Old Stand, Market, head of Front Street, S. F.

Dunham, Carrigan & Co.,

Nos. 107, 109 & 111 Front Street, S. F.

Lathe Without Saw Attachments.

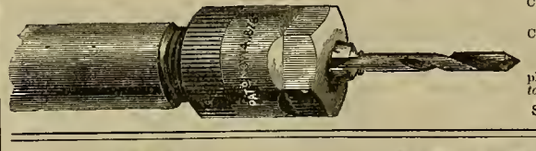


This Lathe has been made especially to meet a want felt by many for a really good and substantially made Foot Lathe at a reasonable price, and we think that we can safely say that it is by far the best Lathe ever placed on the market at the price asked. The bed, head and tail stocks are of iron; the spindles of steel. The bearings of the head stock is conical, so that the wear can be easily taken up.

Material eighteen inch s long and eight inches in diameter can be turned on it. The pieces that accompany this Lathe without extra charge are two T rests, two plain centers, one spur center for wood turning, and one face-plate.

Price of Lathe without Saw Attachments.....$45. Price of Lathe WITH SCROLL Saw Attachment.....$55.
Price of Lathe with both Scroll and Circular Saws, $70.

Trump Drill Chuck.



Chuck, for drills ¼ and under, Price.....$1.50

Chuck, for drills ½ and under, Price.....$2 25

They are made on solid steel plug, centered and *readily fitted to Lathe or Drill Press.*

SEND FOR CIRCULAR.

PIANOS!

LOWEST PRICES,

EASIEST TERMS OF PAYMENT,

MOST RELIABLE INSTRUMENTS. Old Pianos taken as first payment for new. All Instruments fully warranted. Tuning and Repairing. Pianos at Wholesale.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

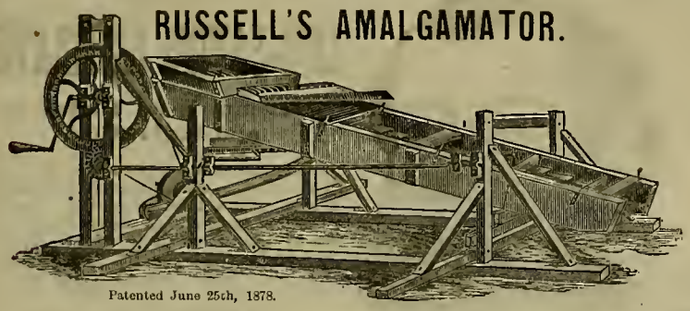
Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

RUSSELL'S AMALGAMATOR.



Patented June 25th, 1878.

SAVE YOUR GOLD

And Also SAVE YOUR QUICKSILVER.

The above Washer and Amalgamator with new patent Wire Bridge Quicksilver Boxes attached, can be worked wet or dry, either by hand, steam, horse or water power, and is easily taken apart and packed. For washing Pulp, Earth, Gravel, Mill Tailings or Black Sand, it is without a rival.

Has been Thoroughly Tested and given Complete Satisfaction.

The entire Lining, Hanging Plates, Riffles and Boxes Amalgamated

IS GUARANTEED TO SAVE THE FINEST OR FLOAT GOLD.

Capacity, 30 to 60 tons per day, according to size. For further particulars apply to

THE SAFETY POWDER COMPANY,

San Francisco, Cal.

CARTRIDGE.

GEN. W. S. ROSECRANS, President.

Fuse Lighter and Fuse.

COL. SAM'L O. GREGORY, Secretary.

Safety Cap and Fuse.

Electric Cap.

Safety Powder, Caps, Electric Caps, and Fuse Lighters.

Under a series of U. S. Patents, after long and carefully conducted experiments and thousands of tests, this Company is prepared to manufacture and supply, for Mining and Engineering Works, the above named articles at prices and on terms as favorable as articles of similar grades are now supplied in this market. Our Powders contain no Nitro-glycerine, no Nitroline, no Gun Cotton, no Fulminates, and are free from the unavoidable dangers in manufacturing transporting, handling and using of all high grade explosives which contain those elements.

Cold does not affect them. They cause no headaches or other inconveniences in handling, and the smoke from their explosion contains no poisoning or sickening vapors.

Their blasting force, with slight tamping, at least equals that of any Powders now used, but they admit and require strong tamping to bring out their immense and peculiar lifting power which follows their detonating work. They should be fired, therefore, by our

Safety Cap,

Which allows tamping without danger. They can be fired by any caps now employed in blasting, but the use of these is always dangerous with any Powder, and the loss of the throwing power resulting from lack of tamping renders it with our Powders doubly objectionable.

Our SAFETY CAPS have twice or thrice the force of triple Giant Caps. When set on fire they do not explode, but merely burn off, and are perfectly safe in transporting and in tamping.

In round tin boxes, 50 cents.

The Safety Fuse Lighter,

Cheap, handy and sure to light the Fuse upon the end of which it is fastened, only needs a trial to be appreciated by every miner who is up to "snuffs." 25 Cents per box; sent by mail.

Safety Fuse,

Equal to the best in the market, will be supplied at the lowest market prices.

In consequence of spurious imitations of

LEA AND PERRINS' SAUCE,

which are calculated to deceive the Public, Lea and Perrins have adopted A NEW LABEL, bearing their Signature, thus,

which is placed on every bottle of WORCESTERSHIRE SAUCE, and without which none is genuine.

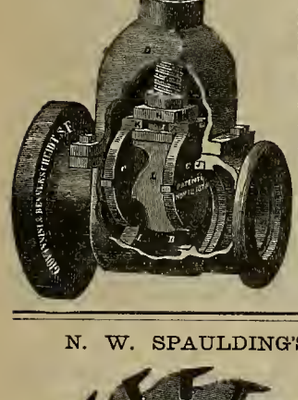
Union Brass Foundry and Mechanical Work Shop.



GIOVANNINI & CO.,

417 and 419 Mission Street, - - SAN FRANCISCO.

The attention of our customers and especially of those interested in Water Works, Gas Works or Mines is respectfully called to our very important improvement in the construction of Stop Valves (or Gates). They differ from all others in that the inner faces are perfectly parallel, therefore when the Gate or Valve is to be opened, at the first movement of the screw the center block (see cut) releases the disks from their bearings, so that they will move easily and prevent the wearing of the inner faces.

This Gate has proved very efficient in Pipes of all sizes, and under any pressure and from its double form and perfect joint formation is especially valuable for use in large Pipes for water, steam and gas, and from its avoidance of any wedge shape cannot jam at any point (see cut).

The **G. & B. Valves** (or Gates) have no equal in simplicity of construction of all working parts, ease of access for repairs, and durability.

We have recently enlarged and fitted up our Brass Foundry and Shop with all the latest improved Tools and Machinery, thus greatly increasing our facilities for rapidly executing orders for all sizes of Stop Valves (or Gates) from three-inch to four feet in diameter, or any size, to order. We guarantee them to give better satisfaction, cost less money, and last longer than any other Valve in use.

We are also prepared to execute all orders in Brass Work for Breweries, Distilleries, Plumbers, Gas and Mining Apparatus, Ship Work, Soda Apparatus, Steam Fittings, Meters, Gauges and Indicators. Also in Machine Pattern and Model Making, and Clock Work. Gear cut to order. Brass Castings of all kinds. We are confident of our ability, and all orders entrusted to us will be executed with promptness and dispatch.

GIOVANNINI & CO., 417 & 419 Mission St, S. F.

VOLUME XXXVIII Number 18.

Wenzell's Pneumatic Clock System.

The question of time is as old as the human race, and as time has progressed the methods and instruments to measure time have been improved. To the savage, the natural division of time by the rolling seasons and rising and setting of the sun, were, for his simple wants, all-sufficient; but with the progress of civilization the necessity of more accurate division of the day was indispensable. The sun dial and the first mechanical contrivance by means of the Clepsydra, or water clock, as also the sand glass and candle clock, were among the first devices to obtain time.

Although the art of clock making has reached such perfection at the present day, that in clocks of the best construction—the variation between the recorded and absolute time will be only a few seconds during the entire year—yet the principle of construction remains the same as in the days of Galileo. A weight continues to be used for obtaining an uniform motive power, and the long pendulum is indispensable for the accurate measurement of the fleeting hours.

These conditions of movements being absolutely necessary, it is impossible to manufacture the motive and regulating power of an accurate time-piece of a shape or size at all adapted for the requirements of a modern dwelling house; and so a substitute has been found in the handsome mantel and other varieties of fancy clocks, but all more or less unreliable as time keepers—requiring a great deal of attention; and, when several clocks are in the house, frequently the cause of considerable inconvenience and dissatisfaction from it being impossible to tell which clock is right.

A good many attempts have been made to obtain an uniform system of time registration by all the clocks in one house, and even of all the public clocks of a city. The electric clock was introduced by Wheatstone as far back as 1840, and promising results were accomplished, but their practical application has not been a success, being unreliable as time keepers.

A California inventor, Mr. Hermann J. Wenzell, finally accomplished the long-sought object by devising a simple and unfailing means of obtaining uniformity of time, and one which the experience of several years has proved practical and accurate. The system is so reliable in its action and comprehensive in its scope that the number of clock faces upon which it is capable of showing precisely the same time, as that indicated by the regulator, is practically unlimited.

The Wenzell Pneumatic or air clocks are now recognized as the best for the purposes indicated. The two essential parts in the construction of a good clock are the pendulum and weight, which are still used by watchmakers as regulators, and for scientific purposes. The ornamental spring mantel clock has taken the place of the old reliable family clock in our parlors, and a very cheap one has been placed in the kitchen; but as both are being run by a spring which, as it is wound up or run down, gives an unequal power, a spring clock is not as good and reliable a time-keeper as the old grandfather's clock.

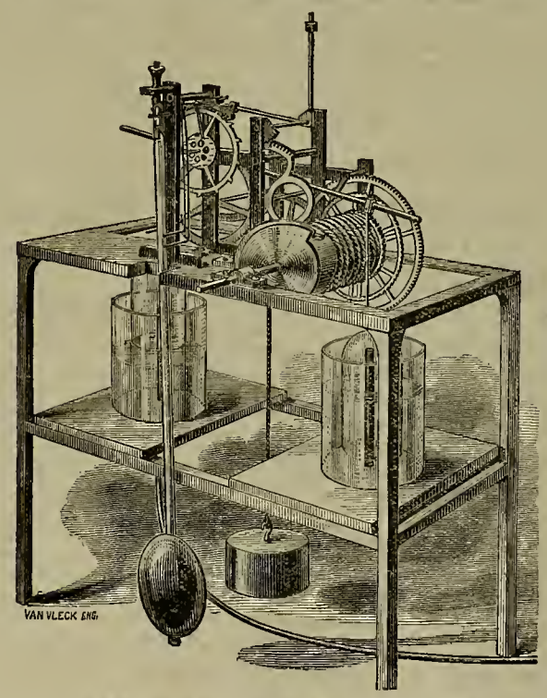
In the construction of a regulator for running clocks by air pressure, the inventor has made use of the advantages of the old principle, and so that his system can be adapted to clocks of any design. This regulator is shown in the engraving on this page.

The prominent features of the invention may be summarized as follows: In any convenient portion of a building is placed a regulator, which is connected with two simple air pumps worked by wheel-work. Attached to these pumps is a pipe, similar to a small gaspipe, with connecting branches. These pipes can be conducted to any number of buildings, and to the rooms where a clock-face is required to be shown. They can be introduced into an ordinary mantel clock mounting, and the costly but frequently useless works contained therein be substituted by a simple face, and silent motion communicated to the hands by the pulsations of the air pumps of the regulator working unceasingly and infallibly perhaps far away in some dark closet.

The great advantage of this system of clock propulsion is this: That time can be distributed and accurately recorded all over a house, or a city, with as much facility and certainty as gas or water, and no matter how numerous the clock-faces may be, it is the regulator alone that requires winding once a week, and as a consequence every other face will show the same time, to a second, without any attention whatever.

Should the winding of the regulator be neglected, it begins to strike a bell for the last 24 hours, calling for attention.

These clock-faces can be introduced in a mirror, in a picture frame, on the wall, on the mantel of a room, or over a door, or suspended like a chandelier, where it would be inconvenient or impossible to keep ordinary clockwork going. The clock-faces, having no works, make no ticking noise. They can be made transparent to show the time at night, and to strike the hours. There is no overwinding,



WENZELL'S REGULATOR FOR AIR CLOCKS.

breaking of springs, or use of keys, and in fact no repairs. It may here be stated, that the electrical clocks at the New City Hall have by no means given satisfaction, and the Commissioners have adopted Wenzell's Air Clock for the unfinished portion of the building. After a most thorough examination from a scientific point of view the St. Ignatius College has also concluded to introduce the clocks in the new building on Hayes street and Van Ness avenue. In the palatial residence of Mrs. Hopkins no less than 35 clocks, each of a different design, have been put up. They are also in use at the Nevada Block, the Baldwin Hotel, London and San Francisco Bank, San Francisco Verein, Real Estate Associates Building, German Hospital, etc. Practical working for several years in these and other buildings, prove that this pneumatic clock system furnishes correct and uniform time for public or private buildings. They have been also introduced in Vienna and Paris and numbers in Europe. These clocks and regulator may be examined in detail at the office and manufactory of the inventor, No. 328 Kearny St., in this city.

TRACK on the Southern Pacific is now laid half a mile east of Moricopa wells, and regular trains will be running to that point next Monday.

Assaying at the University.

Some time ago we published a short account of the College of Mines of the University of California, and called attention to the importance of the work of education it was doing on this coast. We have now to add that the intention then expressed, of adding to the theoretical instruction received, a practical course in all branches of assaying, has been successfully carried out, and that the students are now actually at work in the metallurgical laboratory fitted up for that purpose. It was hoped to commence the present course in the large laboratories of the new Mechanics-Mines building, but it was found impossible to set up the apparatus lately brought from Germany in time to permit of its use by the present senior class. Therefore the experimental laboratory has been pressed into service, and will continue in use the remainder of the term. Still, this building is fully as commodious and provides fully equal facilities to those found in the average city assay offices. The building is divided into three apartments. First, a room for analysis, wet assaying, mixing and weighing, which is furnished with an extensive and varied assortment of crucibles, scorifiers, glass ware and other apparatus used in assaying; second, the weighing room, which contains besides the usual balances, an Oestling and a Becker balance; third, the furnace room, containing a medium sized French muffle furnace which will accomodate eight scorifiere, a small-sized muffle furnace and two crucible furnaces. The class is primarily instructed in the work by Prof. Becker. They then put the theory into actual practice under the immediate supervision of Mr. Dwight Huntley, who has had an extensive experience in assaying both in San Francisco and Nevada, and is therefore eminently fitted for the position of instructor.

The importance of a School of Mines on this coast makes this subject peculiarly interesting, for it is an assurance that the college is the right thing in the right place. It is not wholly theoretical nor yet wholly practical. It is demonstrably a combination of both theory and practice, and therefore essentially fitted for turning out competent and efficient mining engineers.

The Leadville Mines.

Remarkable as the mineral deposits about Leadville unquestionably are, some very grave difficulties and drawbacks seem likely to develop themselves as the work of exploration and ore reduction proceeds in that district. First, the climate, because of the great altitude, presents a serious hindrance to cheap and successful mining operations. The winters are long and bitterly cold, the snow falling early and lying for several months to a great depth. Nothing of a useful kind can be raised, for the double reason that there is no soil and that killing frosts occur every night in the year. Even the summers are disagreeable and unfavorable for out-door work, rain falling almost every afternoon from the middle of June till the last of September. As at all great elevations in this latitude, pneumonia and other diseases of the respiratory organs are exceedingly prevalent in and around Leadville, great numbers having suffered from these complaints the past winter, a large percentage of the cases reaching a fatal termination. Neither health nor comfort can be counted upon by persons who, north of the fortieth degree, take up a residence at an altitude of 12,000 feet or more.

Then a trouble is likely to be encountered from much of the ore obtained here having too little lead to insure its successful smelting. With less than 25% of this metal for a flux it is difficult to reduce these carbonate ores by this method. While much of the ore from these mines carries a large proportion of lead, the majority carries less than 20% and cannot therefore be successfully smelted. That these ores will, with depth, grow richer in lead can hardly be hoped for, as this would run counter to past experience in this class of deposits. Everything considered, Leadville, now so crowded and bustling, does not seem likely to grow into a town of very large dimensions. When all the grounds around it shall have been taken up and there is nothing more to attract prospectors to the vicinage, or even retain those already there, its population will be diminished, only such remaining as can get work or as have secured locations requiring their presence. The number of furnaces to be erected on the spot will depend upon the quantity of self-fluxing ore these mines shall afford. If this shall turn out to be large these establishments will be numerous, and *vice versa*. In any event, a great deal of ore will be sent elsewhere for reduction, that is, if it shall be found rich enough in silver to bear cost of transportation. A careful survey of the field discloses to our view very little in these Leadville mines that ought to greatly excite the California capitalist, speculator, or prospector.

MINING NEAR READING.—A mile and a half above Reading, on the west bank of the Sacramento river, are the hydraulic claims of Breslauer & Tiffan. Their ditch is only one mile long. This, with the reservoir near the claim, gives plenty of water, with a moderate fall, during the rainy season. They have a fine and coarse red gravel bank extending some 30 feet above bedrock, and wash through a 100-foot bedrock tunnel, with several hundred feet of two-foot flume, dumping into the river. A clean-up for the season will be made in about two weeks, when a good paying yield is confidently looked for. From general appearances, and the best information obtainable, we should judge a large amount of ground is yet to be worked successfully in the vicinity of Reading. The only question seems to be as to a large and cheap supply of water.

CONCLUDED TO KEEP IT.—The owners of the Hite mine, after offering it for sale in the East, have withdrawn it from market, a valuable body of ore having lately been developed in the mine. This property is situated in Mariposa county, California, and has yielded the owners to date over a million in dividends.

THE Colliusville canning factory starts up this week. The run of salmon up to this time has been small.

The Valley of the Gunnison.

The valley of the Gunnison is described by all who have visited it as a paradise compared with the Leadville plateau. The altitude is not so great by several thousand feet, and the soil is as rich as that of any of the Illinois prairies. In summer and winter the grass grows in abundance and in rank luxuriance. Timber is also plentiful, the pines attaining three times the size of those growing near Leadville. The valley is known to contain extensive coal banks, and that, too, of a superior quality. Owing to their inaccessibility, no attempt has as yet been made to develop them, but there is little doubt but during the coming summer companies will be formed for the purpose of mining this coal, all of which will find a ready market in Leadville. As the case stands, one of the chief difficulties in the way of smelting is the lack of coal and coke. The latter, indeed, has to be hauled all the way from Trinidad, which greatly adds to the expense of operating reduction works in Leadville.

The miners who passed the last summer on the Gunnison found carbonates in various localities, both along that stream and Willow creek. They had no means of arriving at the value of the ore, but, as it looked well, they kept on prospecting and mining until late in the season, when two of their number concluded to come out, leaving the others to guard the mines during the winter. They accordingly packed 600 pounds of ore in sacks and brought it to Leadville for an assay. That small quantity of ore was sold to one of the smeltere here for $613, showing an assay of over 2,000 ounces to the ton.

The village or settlement of Gunnison lies on the river of the same name, 57 miles from Cleora, nearly due west. It consists at present only of a postoffice, a store, and blacksmith shop. Twenty-five miles north of Gunnison the traveler comes to a spur of the Elk mountains named Crested Butte. In and about Crested Butte there rise three little rivers, named respectively Slate, Washington and Taylor, all of which unite and flow into the Gunnison. In the headwaters of these streams considerable prospecting was done last summer by the party of which Mr. Smith was a member. He says that considerable bodies of ore are to be found in that neighborhood. Unlike the silver deposits of Leadville, they are found in

True Fissure Veins

With outcroppings plainly in view on the side of the mountains. The silver is found in conjunction with galena and copper, and occasionally with carbonates crystallized and having a color of light gray. The silver varies in richness, as it does in all other districts, running from 100 to 1,500 ounces per ton, although the average is higher than is generally found in this camp. In most of the claims already prospected gold has been found, varying from one-fourth of an ounce to 25 ounces.

The climate in the Gunnison valley is described as much milder than on the mountain tops. The warm rains coming over from Utah fall abundantly, the clouds being squeezed when they strike the lofty Sierra Nevada range, and deprived of their moisture. Vegetation is luxuriant everywhere in the valley, and wheat, corn and potatoes, can be raised easily. The basin of the Gunnison is in reality a vast park, being 100 miles long from east to west, and nearly as much in width. In the center of this basin flows the river, while from all the sides pour down the waters of the Uncompahgre, Lake Fork, Cebolla, Cochetope, Slate and Taylor rivers, besides numberless other creeks, abounding in speckled trout, while the adjacent woods are alive with deer, elk, bear and other game. The Elk mountains on the north are said to be of enormous hight, striking ruggedness and most unique and singular appearance. A recent writer says of them: "They differ from any other mountains on the globe because of their peculiar colors and strange forms. In the very front rank of the amazing array of peaks is the Teocalli mountain, a vast pyramid in bulk and form, showing the strange features of successive terraces, rising one above another, with cliff faces and level benches. The form is like the ancient sacrificial altars of the Aztecs, called by them "tcocalli"—hence the name. Teocalli is approached by a lovely open, grassy valley, with a pretty little creek, deeply fringed with trees, running through it, and dividing at the foot of the mountain, a branch pouring down from each of its sides. Viewed in the bright sunlight, the wilderness of pyramidal cones glow in red, yellow, brown and deep maroon, and on the northern and eastern slopes are the largest known fields of perpetual snow in all the Rocky mountains."—*Leadville Cor. Chicago Tribune.*

Moving the Decimal Point to Suit the Case.—The Horn Silver mining company of Utah, having disposed of 40,000 shares of their stock in New York, now offer an additional 25,000 at $17.50 each; these heavy sales at such handsome prices being based on the large quantity of valuable ore in sight in the mine, reported to be $17,000,000 in net profits—say a total of 50 millions, or such a matter. We alluded last week to the big figures that were now being employed in connection with this class of estimates, suggesting that in accepting these latter it would generally be safe to remove the decimal point one figure towards the left—perhaps we might as well remove it two, in this case.

Cape Foulweather.

The *Willamette Farmer* argues that there are good and substantial arguments to be made in favor of Cape Foulweather as the site for a harbor of refuge, if it shall prove that the location is well adapted to the purpose. That is, of course, the main object, but a point might almost be strained in its favor upon the ground that the construction of a safe harbor there will give the Willamette valley the benefit of another seaport. The construction of the harbor will certainly result in the building of the narrow-gauge railroad from Corvallis to the ocean—not to Yaquina bay merely, but to the shores of the constructed harbor. Such a consummation would be of the greatest importance, for while that point cannot become the great commercial port of the northwest, it can do a lively trade, and will result in bringing prosperity to the shores of Yaquina bay, and give the upper counties more direct communication and shorter distance to reach San Francisco, or even to load vessels for Europe, saving the great expense and detention that attends loading vessels at Portland. This advantage can only attend the construction of the harbor where it can be reached by railroad communication with the interior. The pass from Corvallis to Yaquina offers the most favorable route for such a road, and the enterprise of Benton and Linn county farmers has already secured a commencement of that enterprise, and it has been very faithfully worked up, so that its practicability is thoroughly understood. Any improvement in commercial facilities redounds to the benefit of the producer. The harbor of refuge at or near Yaquina bay, and the construction of the narrow-gauge road to connect the Willamette valley therewith, will enable producers of the upper and middle valley counties to ship their products much cheaper, and they will thrive better in proportion.

How well the location is adapted to this purpose is thus stated by a Salem paper: A careful survey of the bay north of Cape Foulweather by the United States engineers has demonstrated the fact that such a harbor already exists there formed by nature, and that only a small outlay is necessary to make it entirely safe, easy of entrance and ample for all practical purposes. At this time there is a sufficient depth of water to float the Great Eastern in perfect safety. It is not Yaquina bay proper, but a little north of that, some three or four miles, and is simply a large cove with good entrance and good natural protection. An expenditure of $656,000 will make it entirely secure, while the smallest estimate for any other point surveyed on this coast is over $3,000,000.

The King of Artesian Well Engineers.

Mr. Eugene Bandel of Benicia, sends us a copy of Wirth's *Deutscher Gewerbskalender* for 1871, in which is a lengthy biographico-technical sketch of Carl Gotthelf Kind, the "King of Artesian Well Engineers." From this sketch we translate the following short summary.

The sinking of deep bore-holes and particularly of such as require principally drilling, has been in earlier times a matter of high importance. However, the art proper, the rational management of well-boring, is a production of the present century. The advances of scientific geology, mineralogy and mechanics, furnished the basis for the explanation of phenomena that had previously been ascribed to blind chance, and without the thorough investigation of which the well-borer's drill would never have been taken from the hands of the rude laborer, and placed in those of the rationally educated engineer.

To the latter class of men belongs Kind, who will always, among all nations, be referred to as the one who knew so well how to improve the practice of well-boring, that the art was made to assume a quite new form.

The special improvements of Kind's in the domain of well-boring instruments and methods for the sinking of bore-holes of both large and small diameters, are so varied and numerous, that space enough is not demanded here to discuss them all. We bring forward, therefore, only the chief ones.

The most radical of Kind's improvements and inventions are as follows: First, boring with wooden instead of iron rods; second, an apparatus called "free-fall-drill," by means of which the drill, after being raised as far as necessary by the rods, falls loose away from the latter and thus accomplishes the drilling; third, auger for widening the bore-hole; fourth, safeties, by means of which breakages of the tools can be immediately discovered; fifth, augers for boring shafts of very great diameter; and sixth, means for making water-tight bored shafts of great diameter.

Rushing.—Three hundred men and teams are at work north of Snake river building the Utah & Northern road. One hundred thousand ties are ready for laying. The Laramie rolling mills are turning out tons of rails for the road, and every prospect points to its rapid advance into Idaho. The cars will run to the Snake river bridge this month. New passenger cars for the road are coming in the Ogden yard, and when the sleeping cars are ready we will have a change of time. The Utah & Northern passenger trains will then make close connection with the U. P. express.—*Ogden Freeman.*

Excursions to the Sierras.

It is understood that a large number of school teachers have decided to spend their summer vacation in visiting Mount Shasta and intervening points of interest. For some reason but few tourists seem to have learned of or duly appreciated that portion of the Sierra Nevada mountains lying in Shasta and adjacent counties. Probably because so much more has been written and printed by Eastern and California journalists concerning the glories of the more familiar (but not more attractive) section of the Sierras crossed by the overland route. The C. P. R. R. Co. by offering reduced rates to tourists over their northern routes realize the above facts, evidently, and are determined to do their part towards making the grandeurs of the scenery and the delightfulness of the climate of northern California better known.

It is also expected that many farming and other camping parties will take a northern direction during their vacation this year.

All will visit en route more or less of the principal towns and cities, including Colusa, Marysville, Chico, Tehama, Red Bluff, Reading and Shasta, passing the old Reading grant in the upper Sacramento valley just before entering the placer and quartz mining districts of the Sierra Nevadas, over 70 miles distant by route to the everlastingly white crowned Shasta.

The U. S. Government fish-hatching station (the most important nursery in all probability in the world) is on the McCloud river 22 miles from Reading. Good fishing is found upwards on different streams, and game is plentiful in the mountains and valleys from this point. Southern's station is 33 miles beyond. Eleven miles further, at Bailey's station, is the lower Soda springs, the water of which is fine, effervescing and icy cool. Five miles on Campbell's hotel is reached at the upper Soda springs, equally notable for a mild draft of wholesome mineral water. Eight miles then brings the tourist into Strawberry valley, in fine view and seemingly in the very presence of Mount Shasta. This and Squaw valley are spoken of in terms of unmeasured admiration by those who enjoyed their pure and delightful atmosphere.

For the benefit of those who may wish the figures, we annex the schedule of excursion rates via the northern division of the C. P. R. R. Co.:

No. Miles from Reading.	To Station named and Return.	From San Fran'co	From Sacramento
22	U. S. Fishery—Allens	24.50	10.50
44	Slate Creek	28.80	23.80
54	Southerns	30.80	25.80
64	Lower Soda Springs	32.80	27.80
65	Castle Rock	33.00	28.00
69	Upper Soda Springs	33.80	28.80
77	Strawberry Valley—Sissons	35.40	30.40

This brings the tourist to the vicinity of the majestic Mount Shasta, famous in song and story.

The Catamaran "Zarifa."—The catamaran is a nondescript vessel new to these waters. It is made of two long and slender parallel hulls, lying apart 12 or 16 feet but joined together by cross-beams. The original pattern is a South Sea Island production. It has been introduced into Eastern waters for some years past, but for some reason or other has not met with much favor in the yacht clubs and yacht regattas. The first catamaran made had a solid deck thrown over the breach between the two hulls, but the strain was so great by the hulls spreading keel out that the deck sprung. Beams were then introduced and securely riveted to the hulls and a deck placed on top, but the vessel in this condition lacked elasticity. The latest improvement is to connect these hulls with beams provided with a ball and socket joint at the point of connection, and a center beam linked in the middle. This allows each hull freedom to play independent of the workings of the other, and relieves the beams of the strain they would otherwise have to withstand. A catamaran of this style of construction, and owned by Robert Hall, of the firm of Howe & Hall, has been imported from the East, where she was built. The hulls are 33 feet in length and two feet in the beam, and 16 feet apart. She is fore and aft sloop rig, carrying a jib almost as large as her mainsail. The length of her canvas is 58 feet—nearly double the length of the hull. Her draft, with half a dozen persons on board, is not over 12 inches. She has been named the *Zarifa*. The *Zarifa* has been admitted into the San Francisco Yacht Club. Such a vessel as the *Zarifa* can be built and equipped in this city for $2,300. A round bottom vessel of equal capacity would cost about $5,000.—*S. F. Bulletin.*

Sub-marine Telegraph to South Africa.—The report comes from London that the British government has decided upon the immediate construction of a sub-marine telegraph to South Africa, having accepted the tender of the Eastern Telegraph Company. The route is by way of Aden, Zanzibar, Mozambique, Delagoa bay, and Natal. It will connect with the whole of the Eastern system of telegraph. From the same source we learn that the subterranean lines in Germany, to which we have several times referred, are attaining vast dimensions, and that the Reichstag has just voted $450,000 for further extensions.

Measurement of Water.

In determining the quantity of water discharged from any ditch, flume or pump column, the method adopted, as a general rule, consists in the selection of a plank (often without regard to any particular thickness), through which a rectangular opening is cut one inch wide by a number of inches long, to the edges of which are tacked two guide cleats or strips, between which a thin strip of wood, forming a gate, is fitted, so that an opening for the discharge of water one inch high by a suitable number of inches long can be made at will, and the number of square inches contained in said opening are spoken of as so many "miners' inches" of water. The head over the center of the opening is not generally mentioned unless requested, and when given will vary from four inches up to ten inches, depending upon the locality, usages, convenience or notions of the individuals gauging the water, and so we find from published records the following variations in the size of opening, head co-efficients and discharge of water, according to the usages of the different mining camps. At Smartsville, the head to center of opening is 9 inches; opening, 4 inches high by 25 inches long. The bottom edge of the opening is on a level with the bottom of the box, and will discharge 100 "miners' inches," and it is said that each inch will discharge 1.76 cubic feet per minute.

The Eureka Lake and Canal Co. measure through an orifice 2 inches high, 6 inches head to center, and an opening 20 inches long is said to deliver 40 miners' inches. The Excelsior, also the Sear's Ditch Co., deliver water under 10 inches to center of orifice.

The Phœnix Ditch Co., deliver it through an orifice 3 inches high, and pressure to center of opening of 5½ inches.

Gold Hill Ditch Co., El Dorado county, the orifice is 2 inches high, 1 inch wide and 4-inch pressure (whether to top of opening or center is not stated).

The Park Canal and mining company, in El Dorado county, delivered 1.39 cubic feet per minute as a miners' inch.

The Civil Code of the State of California, v. 1, p. 404, sec. 1,415, defines, that in locating claims for water rights, the "miners' inch" shall be under a four-inch pressure, which in no way defines the quantity of water discharged, as no dimensions of opening are defined.

Experiments made by H. Smith, Jr., to determine the value of a "miners' inch," at the North Bloomfield, Milton and La Grange mines, the opening was 50 inches long, 2 inches wide, 7 inches to center, through a 3-inch plank; bottom edge of opening had the last inch chamfered off, leaving the lower surface of the opening in contact with the water, similar to an opening that would be cut through a two-inch plank. The discharge for the one-hundredth part of the opening or one miners' inch, gave 1.5744 cubic feet per minute. The ratio of actual to theoretical discharge is stated to be 61.6%. The second set of experiments on the same size opening and head, made by A. J. Bowie, Jr., at the La Grange mine, the effective discharge per one miners' inch is given at 1.4994 cubic feet per minute, or ratio of effective to theoretical discharge 59.05%.

From the above collated statement the necessity will appear of finding out what the parties using the term "miners' inch" mean, or at what mining camp they were educated, before an approximate determination can be arrived at as to the quantity of water in cubic feet or gallons referred to.

On the Comstock, I believe, a majority of the persons using the term "miners' inch" mean a flow of water equal to 12 gallons per minute, or 1.604 cubic feet in the same time, and for convenience of reference I have arranged the following table, giving the flow of water for one "miners' inch," according to the head assumed, varying from four to ten inches to the center of the orifice. The co-efficient of contraction is taken at 6-10, being an average value from experiments, with an opening of one square inch cut through a two-inch plank, the temperature of the water being at 70°, one gallon equaling 231 cubic inches, and the weight of same at the above temperature is almost exactly 8.3 pounds:

Head to Center of Opening.	Discharge per Minute in		
	Cubic Ft..	Gallons.	Pounds.
4 inches	1.159	8.669	71.96
5 inches	1.292	9.665	80.22
6 inches	1.417	10.599	87.98
7 inches	1.532	11.460	95.12
8 inches	1.637	12.245	101.63
9 inches	1.737	12.993	107.84
10 inches	1.830	13.689	113.62

For any other size of opening, either of hight or length, the co-efficient of contraction, due to friction, and with it the quantity of discharge, will vary; and hence, when "miners' inches" are spoken of, all the conditions affecting the discharge or measurement should be given, if anything more than a guess at the quantity meant is desirable.—*W. R. Eckart, in Territorial Enterprise.*

Cooling Hot Journals.—Von Heeren proposes a method of cooling hot journals by a mixture of sulphur and oil or grease. The fine metal dust formed when a journal runs hot, and which strongly acts upon both journal and bearing, forms a sulphide of sulphur. This compound, which grows soft and greasy, does not cause any appreciable amount of friction. It has been very successfully used by the steamers of the North German Lloyds.

MECHANICAL PROGRESS.

Improvements in Iron Production.

In our last issue we gave an extract from an article written by J. W. Mallet for the *American Chemical Journal* entitled "A brief review of the most important changes in the industrial applications of chemistry within the last few years." The portion which is of most especial interest to our readers is that on the improvements in iron production, which we continue from last week:

As regards wrought iron, whose day for many purposes can by no means be considered as gone by, the most notable manufacturing improvement has undoubtedly been the introduction of mechanical puddling as a substitute for the more laborious and less uniform hand work. After many previous attempts, success in this direction has come with the application of the rotating hearth, of which the Danks furnace arrangement deserves to be taken as the type. The more general use of currents of water through double furnace walls as the means of allowing the highest temperatures within, with diminished risk of injury to the walls themselves, is an extension of the long-used water backs of the refinery furnace.

For cast iron, aside from the marked increase in the size of many of the furnaces built, and in some hands the use of a blast of considerably higher temperature than was usual a few years ago, the question of most interest has been that of the elimination from the metal of phosphorus and sulphur, particularly the former, with a view to the supply of metal to the steel makers suited in this respect to their requirements, since the modern methods of steel manufacture do not tend to remove phosphorus if present, the Bessemer process even relatively increasing its amount, and its retention in the steel to any large extent being ordinarily in the highest degree objectionable. The comparative scarcity and therefore cost of ores originally free, or nearly so, from phosphorus, while others are abundant against which the presence of this element can alone be urged in objection, renders the problem one of great importance.

Of the many plans proposed for getting rid of the undesirable element, two seem most to deserve notice. It has been found that in Cleveland ironstone from Yorkshire in England, and the same is probably true of many other ores, the phosphorus exists mainly, if not solely, as calcium phosphate, and that by washing the ore with a solution of sulphurous acid, obtained by passing the sulphur dioxide from burning pyrites into water, a large proportion, up to even 90% of the phosphorus, may be dissolved out and removed. It has been urged against this process as a fatal objection that the ore must be in fine powder to allow sufficiently thorough contact with the liquid acid, while the pulverulent condition unfits it for smelting in the ordinary way. While this is true as regards after use in the blast furnace, it seems quite possible that ore in powder might be managed in the Siemens furnace for the production of "Landon" steel, and, in the absence of material naturally pure enough, this process of preparatory washing may yet find application to a certain extent.

The other plan to be mentioned has more extensive claims to attention, if the facts upon which it rests are fully confirmed by further experience, and if it can be brought into practically workable shape. Mr. Lowthian Bell, to whose intelligently directed researches we owe much important information in regard to the chemistry of iron smelting, believes he has ascertained that phosphorus may be in large measure removed from melted cast iron by oxidation at a temperature lower than that suited for puddling, the oxygen being derived from a bath of molten oxide of iron or slag very rich in such oxide; though at a higher temperature, at all approaching that of the Bessemer converter, phosphorus would be taken up again by the iron from the very same slag. It is proposed that the iron shall be brought rapidly into contact with the rich slag by running it from the furnace into a circular converting vessel, revolving about its axis and containing the slag already in a state of fusion. In one experiment it was found that the phosphorus in iron from Cleveland ore could by such treatment be brought down to .055%, while continued contact, at full puddling heat, with the puddling furnace slag which had served as the means of purification, raised the proportion of phosphorus again to .153% in 65 minutes, and to .365% in three hours. These experiments are suggestive and full of promise that a solution of this important problem will yet be found, though as yet it cannot be said to have been reached in a practically useful and generally applicable form.

In noting the chemical aspects of the iron and steel industry, as developed in the last quarter of a century, we can not overlook the magnificent scale upon which the mechanical appliances used in working the metal have outgrown their former dimensions.

A visit to such works as those of Creuzot in France, Krupp's establishment at Essen, in Germany, the heavy gun factories at Chatham and the armor-plate mills at Sheffield, in England, or even to several of the works which have grown up in this country, presents a truly impressive picture of mechanical power directed and controlled by human brains. Such a single tool as the great Creuzot steam hammer, with its 75 or 80 tons of iron falling 18 feet upon an anvil of nearly 900 tons, and capable of forging masses of steel of 120 tons or more, represents a marvelous advance upon the means at the command of the iron workers of 50 or even 20 years ago. Yet the very source of the demand for these mighty machine tools, the growth of the manufacture of iron, and yet more steel, has, in the improved character of the material produced, opened up a still wider field and enlarged possibilities for the employment of mechanical energy upon the grandest scale.

MANGANESE STEEL should show a very fine grain in fracture, and an analysis should give substantially the following results: Sulphur, .10; phosphorus, 27; carbon, 65; manganese, 1.50. Metallurgists tell us that such a metal resists shocks very well, and that this enormous quantity of mangsnese added to the metal neutralizes the evil effects of phosphorus. But the best thing that can be done is to avoid the use of such cast metal cured by manganese. Two strips of the same metal when white-hot were welded together, but when it was attempted to bend them the first blow divided the strip into two pieces through the weld. Steel must not contain more than 0.3% or 0.4% of mangsnese, and a metal containing 1.50% or 2% of manganese is in most cases good for nothing. Inferior material, even if cured by manganese, will always give inferior steel. But as certain works prepare such a curious steel, it would be a benefit for the buyers if the manufacturers would supply them with a true analysis of the steel, because otherwise the buyer may get a cast metal which only the manufacturer can call "steel."

THE evils attending the use of oils and fats as lubricants upon machinery are well known to engineers and mechanics, but the causes and nature of their injurious action are not so generally understood. We give, therefore, a brief but very lucid explanation of their action which we find credited to Dr. Marquardt, by our contemporary, the Boston *Journal of Chemistry*. The most obvious and least objectionable evil attending their use is the gradual oxidation (or gumming) which they undergo, and in consequence of which their lubricating qualities rapidly diminish. A more objectionable property of these substances shows itself when they are applied to such parts of machinery as are more or less highly heated. In such circumstances, these substances are decomposed into their constituents, glycerine and fatty acids. The latter combine with the iron work of machinery to form an iron soap, the metal surfaces being corroded thereby and fresh surfaces exposed to corrosion. Marquardt recommends the substitution of the mineral oils (heavy pétroleum products that boil above 600° F.) for animal oils and fats as the remedy.

THE MANUFACTURE OF GUN BARRELS.—In the manufacture of a gun barrel, the process has changed somewhat at the Springfield Armory since 1861. Then an iron "scalp," 18 inches long, six inches wide, one-half an inch thick and weighing 10 pounds, was thrown into a furnace, heated, and curved in a rolling machine. It received only two welding heats, but was changed many times from the furnace to the rolling machine, or until it was rolled to the proper size and extended to the length of the barrel. In the rolling process a cavity was preserved with different sized steel rods. While hot, the barrel was passed on a rod into a straightening machine, afterwards annealed, cone-seated, bored, turned, ground, milled, rifled and polished. Now the workmen start with a steel bar eight or ten feet long and about one inch in thickness; cut it into pieces six or eight inches long, bore each piece, pass them into a furnace on a rod, then into the rolling machine, and proceed as in the old process.

RAILROAD ITEMS.—A French writer estimates that 4,000,000 tons of rails are required every year to renew the worn-out stock on the railways of the world already in operation, besides what are needed to lay down new roads. The average wear of a rail is 10 years. The rolling mills of the United States have a capacity of nearly 2,000,000 tons, though the consumption of rails, including imports is not half that amount. The capital invested in all the railroads of the globe exceeds $15,500,000,000. These roads, according to the statistics of Prof. Neumann-Spallart, require 62,000 locomotives, 112,000 passenger carriages, and 1,500,000 goods trucks. Annually 1,600,000,000 tons of merchandise and 1,500,000,000 passengers are conveyed by these means of transit.

WORKING STEAM AT HIGHER PRESSURE.—It is well known that great efficiency in steam engines is obtained by an increase of pressure and the use of expansion. To accomplish this, the point lies not so much with the engine as with the boiler, engineers finding no difficulty in working an engine with steam at 150 or 200 pounds per square inch; therefore Mr. Walt, an eminent Liverpool engineer, thinks there is no practical limit to the working pressure. Some engineers will be inclined to differ with this opinion, as the management of steam used expansively in simple reciprocating engines at ranges of pressure much exceeding those named, is considered by many risky practice.

SCIENTIFIC PROGRESS.

New Minerals.

Gedonite is the name applied by Helm, to what he describes as a new fossil resin, occurring with the amber of the Baltic region, and distinguished from it by reason of its greater friability, which unfits it for some of the applications of amber. The workmen call it friable or unripe amber. The author holds that this resin is not from the true amber pine (*Pinites succinifer*), but from some allied species. He finds it to be softer than true amber, to have a lower melting point, and to contain less oxygen in its composition. It is more readily soluble in ether and other solvents than amber, and contains no succinic acid. The name is from *Gedonia*, the Latin designation of the ancient city of Dantzic, near which it is met with. (For full description consult *Arch. d. Pharmacie*, December, 1878.)

Randite is the name given provisionally to a supposed new mineral substance, the analysis of which was reported to the Academy of Natural Sciences, of Philadelphia, at a recent meeting. The name is in honor of a well-known local mineralogist.

Urisite, a new mineral species, is described by Frenzel as occurring in the Caucasus, in association with Gelheisenerz (Jarosite ?) and conperas. Color, lemon-yellow to orange; streak, ocher-yellow; hardness, difficult to determine, but very low; specific gravity, 2.22; occurrence in bulbous masses, or pulverulent, earthy; the masses may be readily crushed between the fingers. When one of them is crushed, the glitter of exceedingly small crystals may be observed, of which the mass is made up. The crystals are orthorhombic, and under the microscope appear to have a stout prismatic habitus, with sharp edges, and to be generally well developed. The basal plane is often absent, and occasionally is strongly developed at one extremity, and absent, or but very slightly developed at the other, so that the crystals have occasionally a hemiphoric aspect, and resemble very closely the well-known tabular crystals of calamine. The crystals are transparent. After the removal of a few per cent. of insoluble impurities, the mineral was found to have the following constitution:

Sulphuric acid	32.08%
Ferric oxide	21.23%
Soda	16.50%
Water	19.80%
Total	99.66%

corresponding to the formula, Fe_2O_3, $2Na_2O$, $4SO_3$, $8H_2O$, and placing the mineral in Dana's group of hydrous sulphates.

INTERESTING EXPERIMENT.—During a recent snow storm, in the early afternoon, an interesting experiment was tried in Paris. At the moment when the sky was darkened by snow, the electric lamps were lighted in the square of the Theater Francais. The reflection of the light from the snow-flakes immediately dispelled the darkness and produced a very pleasing effect. It is proposed to try a similar experiment in misty weather, and if the light can penetrate even to the distance of 20 meters (65 6 feet), Jahlochkoff lamps will be established at points where the passing is most frequent.

THE influence of minute forms of vegetation in producing disease is illustrated in a singular example given in the *American Naturalist*. The dried blood of horses that had died of the "Loodiana fever," in India, on being sent to England, there afforded seed from which a crop of *Bacillus anthracis* has been grown, which justified its distant pathological origin by reproducing the disease in other animals.

FAWSITT has recorded a curious experiment on the resonance of flames. A tuning fork struck upon a table, and held till its sound was inaudible, was placed in the tip of the flame of a Bunsen burner. The sound came out again loud enough to be heard at some distance. Sir William Thomson explains the result by supposing that the flame acts as a resonator owing to the differences in the density of the gases which it contains.

FORMATION OF DEW.—An Amherst Professor has made a series of experiments from which he deduces a theory of the formation of dew exactly the opposite to that commonly taught. He maintains that dew, instead of being the result of condensation of the moisture of the atmosphere by contact with objects of lower temperature, is caused by condensation of warm vapors rising from the earth when the temperature of the air is lower than that of the earth.

PINTO'S JOURNEY ACROSS AFRICA.—Pinto, the Portuguese explorer, reports that, notwithstanding the grievous hardships and difficulties, he succeeded in saving all his papers, embracing 20 geographical charts, many topographical maps, three volumes of notes, meteorological studies, drawings, and a diary of the complete exploration of the Upper Zambesi with its 22 cataracts.

Light and Heat in Gas Flames.

At the recent meeting of the American Gas Light Association, Dr. T. O'Conner Sloane, Brooklyn, New York, read a paper as above.

It is well known to us, he said, that heat, in its industrial applications, is wasted to a great extent. The old problem of the conversion of heat of low into corresponding heat of high temperature, has to be solved, and to its non-solution the waste in most cases is due.

Theoretically, one pound of coal should melt 40 pounds of iron, yet this result is never even approached in metallurgical practice.

I wish to examine very cursorily the loss of heat in a gas flame. Light is here produced by the intense heat. The combustible gases are peculiarly fitted to produce such heat, because, as they are already in the gaseous state, they do not, in their combustion, have to make the step from solid to gaseous, as solid combustibles do.

The light given by the flame is due to the ignition of particles of solid matter. Carbon is present in the unignited gas in combination with hydrogen, as constituent atoms of gaseous hydrocarbon. When the gas burns, the heat of the flame decomposes these compounds; solid carbon, in a state of almost molecular division, is liberated, and becoming white hot, or incandescent, emits light. It travels upward through the flame, until reaching the top and outer zones, it is burnt into carbon dioxide, commonly called carbonic acid gas.

All the light of gas is due to the ignition of this carbon. The proof of this fact is, that while gases and liquids ignited may give light, it can always be determined by the spectroscopic analysis whether light is due to an ignited gas or not. Theoretically, and in fact, the spectrum of light derived from the ignition of a gas is discontinuous, while liquids and solids ignited give a continuous one. On subjecting the light of illuminating gas to this examination, it is found that it is due to the ignition of solid or liquid matter, because its spectrum is continuous. As there is no reason for the belief or probability that there is a liquid there present, we find that its light is derived from an ignited solid, and by analysis we find that carbon is the only substance present that remains in the solid state at elevated or even ordinary temperatures.

Where Does Coal Oil Come From?

This is one of the questions that has long agitated the scientific world, and upon the answer to it more depends than seems to at first sight. If we know its source we can fairly determine as to the nature and extent of the supplies, and as to where to look for them. The *Scientific American* says: Some have thought that the oils have been produced by a slow distillation during the process of coal formation. A fatal objection, however, to this theory is found in the fact that Great Britain, which has immense coal beds, contains nothing of the kind, though supposed traces have been found here and there.

The silurian and devonian rocks, which contain the sources of most of the oil wells now in existence, have great quantities of fossil remains, and this has suggested the theory that the oils have resulted from their decomposition.

Prof. Mendeljeff thinks that on the first formation of the earth vast reservoirs of inorganic iron and carbon existed in the interior of the globe. These were reached by the water condensing on the newly formed land and percolating beneath its surface. The heat decomposed the water into its component parts, oxygen and hydrogen, the first forming with the iron oxide of iron, the latter with the carbon petroleum and other hydro-carbons. If this theory be the correct one, there still exists in the center of the earth reservoirs of petroleum that are to the sources as yet known as the ocean is to the spring, whose waters finally find a resting place in its bosom.

Dr. T. Sterry Hunt, of Massachusetts, propounded in 1861 a theory to which he still adheres. He thinks that many of the animated beings of early ages were half vegetable, half animal, and that the decomposition of their tissues produced what is known as mineral oil. Certain magnetic oliferous limestones have been found to contain 4½% of their bulk of petroleum. A square mile of these 35 feet thick would yield nearly 8,000,000 barrels, and as the area of these rocks is very great, they may contain supplies calculated to last an indefinite period of time. The subject is one well worthy the attention of all interested in oil wells.—*N. Y. Journal of Commerce.*

DECOMPOSITION OF WOOD-TAR AT A RED HEAT.—A. Atterberg mentions that the results obtained by Lihermann, Burg, Salzmann, and Wichelhaus agree with his own observations on the tar of pine wood. By passing the tar and the less volatile tar oil of the Swedish "wood-oil" works through iron tubes filled with coke at bright redness, he obtained a tar containing all the important constituents of coal tar. It yielded 7% benzol and toluol; it was rich in naphthaline; it contained a tolerable quantity of anthracene, but little phenol. At incipient redness were obtained 10% toluol, containing a little benzol; phenols boiling between 190° and and 220°, but little phenylic acid, 0.3% of anthracene, but no naphthaline.—*Chemical News.*

Mining Share Market.

Hopeful signs of life have been seen here and there during the past week, though the fluctuations have not been very great, nor prices very permanent. There have been some good features and some serious drawbacks. The former in the scarcity of marginal holders, the absence of wild and varied fluctuations, and a firm and apparently healthy demand for prominent shares. The latter in the discouraging lack of dependence to be placed on the regularity of present bullion production and the delay in reaching the long-promised new bonanza ground in the Comstocks. The early part of the week presented the same old story, prices firm and business light. Farther along, a stronger tone was developed and a number of stocks, notably the south end Comstocks, rose. The movement was slight, however, for but few succeeded in reaching a dollar rise. Toward the close there was a strengthening of quotations all along the line, with an evident purpose of forcing a rising and active market. This movement can hardly be referred to any actual "finds," it is rather the result of a feeling that there is a better and more healthy speculative market not far ahead in the future.

Accounts for Their Failure.

Editors Press:—In your last issue you say that you are surprised at, and cannot account for, the many English failures in "stocks, mines, tunnels and other schemes" on this coast, and court answers from those who think they can throw any light on the subject.

In regard to stocks English investors have, in common with all outsiders in this hazardous game, only added to the ill-gotten gains of the insiders. As regards their investments in mines, I must be allowed to dissent from the following expressions that occur in your remarks on this subject: "And yet they do not seem to have acted precipitately in making these investments." "They neglected none of the usual precautions." "They employed competent experts," etc., etc.

In treating this matter seriously it must be admitted that there are many blanks to a prize in American as well as English mining, and therefore more than ordinary amounts of practical experience and common sense are required, for both selection and development of mines, here as well as elsewhere.

I will therefore ask you, and through you these English investors, the following pertinent questions:

Would they be willing to work a Cornish mine simply on the recommendations of college professors or graduates, even were they no less eminent than Dana or the celebrated Englishmen, Lyell, De le Beche or Murchison? Have not Cornish mines been *invariably* worked only after advice from *experienced, practical* captains?

We have many such practical men here whose intelligence and long experience have greatly aided American miners to success; yet, strange as it may appear, only in a few instances, have these parties from abroad availed themselves of their valuable services. If they would consult more generally the opinions of men having practical knowledge of mines and mining affairs, their chances for making a final success would be greatly increased; besides, we hardly ever hear of anyone belonging to this class of experts, making money enough out of two or three mine examinations to enable them to give up business and live on their incomes.

Anglo-Columbian.

San Francisco, April 29th, 1879.

Copper City, Shasta County.—We learn that since the recent assignment, the Extra mining company's mill is steadily yielding a good profit and the assignees are paying off the back wages of the workmen, as preferred claims under the law. The O'Harra furnace has done good service at this mine. This furnace has demonstrated that ores in this district can be worked at a profit. Will not this fact prove an incentive for capitalists of good judgment to come forward in season and develop many of the idle and rich claims of Shasta county, having ores that have heretofore been considered difficult of reduction. The Winthrop company are doing limited prospect work. The Afterthought company have a new O'Harra furnace erected, which will go into operation soon.

At the Iowa Agricultural College every girl in the junior class is taught how to cook and other household accomplishments.

A valuable limestone quarry has been discovered in the hills west of Colusa.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

The Oneida.—*Dispatch*, April 26: A crosscut has been running for some time past in the Oneida mine, in search of a vein of quartz calculated to exist in the direction the tunnel was run. In this crosscut a ledge has been struck, which, being followed down a short distance, has developed some very fair looking rock. It is reported that a number of additional stamps will be set in operation at the mill about the first of next month, there being only 20 employed at the present time.

Plymouth Notes.—Cor. *Ledger*, April 26: Aden & Co. have bonded their quartz mine to a San Francisco company of capitalists, who have commenced work. The claim is patented, and is located about three-fourths of a mile south of the Phœnix lode. Charles Green and company have commenced work on the quartz claim on the south extension of Thomas Bowden & Co.'s claim. It is their intention to fully prospect the ground this season. Lucky Baldwin is interested in the development of the Aden mine. Last Friday the long deferred pay day of the Phœnix company rolled around, to the joy of the workmen. During the last seven months, so New York papers say, dividends have been paid to the amount of $114,000. It is not known whether that includes all the surplus earnings of the company or only the dividends paid to New York stockholders.

DEL NORTE.

Coal Prospect.—Crescent City *Courier*, April 26: While Jose Teran was digging post holes for Jos. Marhoffer, on his ranch, he struck a prospect of coal which is thought to be an extensive vein. The work of further prospecting will be done immediately, which may develop a mine of wealth.

Silver Mine.—A rumor is afloat that a silver and copper lode has lately been discovered about eight miles north of Big Flat, by a Mr. Condon. If reports prove true, it is nearly, if not quite equal to the great mineral discoveries at Leadville, Colorado. The work of prospecting it has already began.

EL DORADO.

Springfield Mine.—Placerville *Democrat*, April 26: This mine, formerly the "Church Union," is in splendid condition. The main incline will soon be down to the 700 level. A strong force is at work on the stopes keeping the 16-stamp mill running steadily. The development of the mine has progressed so far that an additional battery of 10 stamps will soon be put in. Mr. L. R. Foundstone, the superintendent, is thoroughly conversant with his business, and, under his management, everything moves as smooth as clock work.

FRESNO.

Tin Mine.—*Expositor*, April 26: Since the discovery of Charley Converse's tin mine, on the south side of King's river, several other deposits of tin have been discovered in the Sierras. The deposits appear to be extensive—one vein being traced for over a mile, and varying in width from 30 to 60 ft. If the ore should prove rich enough to work, and sinking on the veins show them to be permanent, a new species of mining industry will be developed. A good tin mine is more valuable than a gold mine.

MARIPOSA.

Rich Prospects.—*Gazette*, April 26: A rich prospect has recently been struck in the Pine Tree mine and tunnel, of the Mariposa Land and Mining Co., where the tunnel taps or crosses the specimen vein. At this point they have been sinking a shaft which is 166 ft below the level of the main tunnel, and about 60 ft below the bed of the river. Already a four-ft vein of good milling ore is at command, and in this is an exceedingly rich strata of rock about three inches in width, and growing wider as the work advances. There are said to be other and richer developments recently cropped out in the vicinity of the valley which are astoundingly rich in gold, but for certain reasons are kept a secret. It may be that the secret discovery is just off the edge and will be found necessary to move the stakes over a little, so as to be included inside or outside the present survey. It is well known to be a portable boundary, or was during Fremont's administration.

MONO.

Standard.—*Standard*, April 20: The south drift from the main shaft, 385 level, has been run 15 ft; total length, 380 ft. The ledge is three ft wide, and looks well. It is expected that a connection will be made in a few days between this drift and the north drift on the Cook ledge. The east crosscut from this south drift is in seven ft, and at present is in hard rock. North drift to connect with the incline is in 141 ft; progress, 14 ft. The ledge is three ft wide, of very fine ore. An upraise has been made on this ledge 20 ft, at a point 100 ft north of main east crosscut, where the ledge is three and one-half ft wide, of good ore. The east crosscut, 700 level, is in 40 ft. The rock is still very hard. The west crosscut is in 57 ft. The West Standard winze is down 70 ft, and shows the ledge 18 inches wide, of rich ore. The Gildea south drift is in 115 ft. The ledge is two ft wide, and looks well. The Cook ledge in the north drift is 18 inches wide, of very rich ore. This drift is in 170 ft. The stopes are looking well.

Bulwer Con.—The south drift, 380 level, is in 272 ft; progress, 10 ft. The ledge is two ft wide, and looks well. The west crosscut from this drift is in 120 ft, a progress of 20 ft. The rock in the face is very hard. The north drift from this crosscut is in 30 ft. The ledge is three ft wide. The south drift is in 25 ft. The ledge here is two ft wide, and looks well. The south drift, 300 level, has been extended 13 ft; total length, 102 ft. The ledge is two and one-half ft wide, of very fine ore. The Stonewall stopes are looking well.

Red Cloud Con.—The west crosscut, 400 level, is in 259 ft. Since passing the Packard and Morton vein, the drift has passed through 35 ft of low-grade quartz. One seam of clay and quartz was cut, prospecting well in coarse gold. The east crosscut, same level, is in 206 ft. On the 250 level, drifts are being extended north and south on the Red Cloud vein. That to the south is two and one-fourth ft wide, of $20 ore.

Summit.—The north drift, 200 level, has been run 10 ft; total length, 136 ft. The ledge is 10 inches wide, and looks well. The east crosscut from this drift is in 34 ft, and at present is in very hard ground. The south drift is in 250 ft; progress, 39 ft. The ledge is 18 inches wide. The shaft is down 68 ft below the 200 station. The ledge in the bottom is two ft wide.

Tioga.—On the 320 level a progress of 10½ ft was made in the west crosscut. On the 420 level, 17 ft was made in the east crosscut. The west crosscut, 520 level, is in 110 ft, a progress of 27 ft the past week. A north drift will soon be started on this level. The shaft will be widened to a three-compartment from the surface down within three weeks.

The Belvidere.—The winze on Great Western Hill is down a distance of 40 ft. The bottom of the winze is not showing as much rich ore as when started, and is from 25 to 30 ft deep. The ore chimney seems to make off to the north. The Bulwer tunnel is now in Belvidere ground, and, judging by the sound of their work and without a survey, they must now be very close to the Great Western ledge. This tunnel will crosscut their ground about 150 ft deeper and about 150 ft further north than the winze they are now sinking. The Bulwer will soon connect their 406 level from the Standard new shaft with the bottom of the winze in the Stonewall ledge. This will give good air and enable them to cheaply prosecute important work on the east side of their ground.

Fine Development.—One of the most encouraging developments that has taken place on the east-southeast slope of the Bodie bluff for months past is the cutting of a two and one-half ft ledge of clean, well-defined quartz, on the 250 level of the Jupiter, a distance of 72 ft directly east of the main shaft. The strike of the ledge is a peculiar feature, as its course at the face of the crosscut is pretty sharp northeast and southwest. The ore prospects at the narrow point passed through satisfactorily, and drifting upon it is not unlikely to run into ore of superior grade, as it possesses an unusually healthy character.

NEVADA.

Round Mountain.—*Herald*, April 20: From near the south end of the south tunnel a drift has been run 86 ft, and on each side of this drifting is at present going on. The ground is being drifted from the end of the branch tunnel toward the main tunnel. There are at present 12 men employed at the mine and they are taking out the gravel quite rapidly. There is a fine natural dump at the mouth of the tunnel and the company have constructed about 500 ft of flume, with a splendid under-current, through which the gravel is passed in the washing process. Water is obtained from the South Yuba ditch. The company have just let a contract to extend the main tunnel ahead 100 ft further.

The Planet.—*Transcript*, April 26: Blue gravel has been struck in the Planet mine, near Lowell Hill, in the upraise from the tunnel, at a distance of 1,712 ft from its mouth. The upraise was commenced several weeks ago, and had reached a distance of 20 ft when the regular blue gravel channel that runs through the ridge was run into. The gravel is of exactly the same character as is found in the Swamp Angel, adjoining ground, being composed of fine broken quartz and cement, and prospects in gold. It is not yet ascertained whether the bottom of the channel has been struck or whether it is on the pitch of the bedrock. Drifts will be run to determine this fact, and if found necessary the tunnel will be extended on its regular grade to reach the channel at its lowest point. It is believed, however, that the tunnel is low enough to work the ground to full advantage. The company owns a large body of ground which will require years to work out.

Washington Mine.—The new shaft on the Washington mine having been opened through, about two weeks more will be required to do the necessary timbering to put it in good working condition. The company intend putting in a new water wheel to drive the pump. It will be 40 ft in diameter, and driven by water from the ditch that supplies the stamps of the Idaho mill.

The Hudson Mine.—Everything at the Hudson mine in Pleasant valley is running to the satisfaction of the management. Level No. 2, at a depth of 184 ft, is now in 32 ft south, the work on it all having been done within two weeks. The vein in this tunnel is 17 inches thick, and quite rich in sulphurets and free gold. The tunnel is to be pushed ahead by contract about 50 ft further before stoping commences.

Other Notes.—The McAllis claim, at Hunt's hill, which has been shut down for repairs for several days, commences washing again this week. The Florence blue gravel mining company partially suspended operations a short time since to put in a derrick and make other improvements and repairs. This week washing will be commenced in full blast again. The Pittsburg mine is taking out good rock on the 600, 700, and 800 levels. The mill is kept running up to its full capacity, and is doing good work. A blast of 800 kegs of powder was made at the claims of the English company at You Bet lately. An immense amount of ground was broken up by the blast, and extended so far as to endanger the road, the bank being within 30 ft of the road, which is badly cracked.

PLACER.

New Mine.—*Herald*, April 20: A short time ago Geo. Manuel discovered and commenced work on a new quartz ledge on Duke's place, near the Stone House, a short distance down the ravine from Auburn. He has the shaft down now 22 ft, and in sinking that depth, has taken out 10 tons of the ledge rock. A sample crushed at Simons & Pelster's mill panned out about $10 to the ton. This prospect is considered quite encouraging.

Excitement.—*Argus*, April 26: There is some local excitement over rich reported discoveries made in two quartz mines lately re-located about half a mile southeast of Penryn. Mr. Fogg, of Sacramento, is the owner of one of these claims. He is about to erect a 10-stamp mill to be run by water from the Bear River ditch.

SAN LUIS OBISPO.

Gold Discoveries.—*South Coast*, April 23: It is reported that rich placer gold has been discovered on the headwaters of the Santa Maria river. It has been known for a long time that gold was there, but recent prospecting has developed the fact that the diggings are rich. Quite a number of persons have already gone out.

SANTA BARBARA.

Prospecting.—Lompoc *Record*, April 26: Lompoc is still striving to get up an excitement among gold hunters. The recent developments in this direction would seem to indicate that she may yet rank favorably with prominent mining districts. The findings thus far, though very promising, are not sufficiently alarming to cause farmers to neglect their soil, though many have already staked off claims, and had their first experience in placer mining. The Russel amalgamator, which we believe was shipped down from San Francisco, did not give entire satisfaction, as it was almost impossible to save the fine gold with it. Some fine specimens of quartz were brought in from the vicinity of El Tranquillon last week.

SHASTA.

Copper City.—Reading *Independent*, April 24: There are 30 men employed in the Extra mill, there being two shifts of 15 men each. The mill is kept constantly running, and bullion is being produced at the rate of about $5,000 per week. Under the able management of Mr. Hall expenses are reduced to the lowest possible figure, and at the rate they are at present turning out bullion it will not be long before the company will be free of debt.

SIERRA.

Hunter's.—Downieville *Messenger*, April 20: The ground of this company lies beneath the ridge of which Mount Filmore is the most conspicuous point, across the course of the rich lead of the Howland Flat mine of days gone by; the Union, Hawkeye, Down-East, Pittsburg, Monumental, Empire, all drew upon this deposit, and now the Bonanza takes it up where the Empire left off, and the Hunter's joins immediately upon the Bonanza, covering the whole ridge, from beyond the summit northwest to the outcrop of the rim rock upon the southeast, and for a full mile along the natural and inevitable course of the lead. The claim has a tunnel into and 400 ft beyond the rim rock, which pitches under the channel, being from 50 to 100 ft above the bottom. A shaft will be sunk in the said channel this summer, and when its riches are thus demonstrated another tunnel will be run to tap it.

TRINITY.

Lower Trinity.—*Journal*, April 20: From this section mining prospects were never more cheering. Rumor says that near the mouth of Hawkins creek, where parties have been engaged running tunnels for several years, the Blue Lead has at last been struck and promises large production. A company now working have a bank of gravel 50 ft in depth, the lower 15 ft being regular blue gravel, and the belief is that the old bed of Trinity river has been found. The deposit is known to extend for half a mile and probably much farther. The gold found in the blue gravel is principally mixed with quartz. There are said to be many similar openings in that section, but capital is needed to bring water in order that they may be worked.

New River.—A Portuguese company on Quimby's Flat, have lately struck a back channel which is very rich. It lays further back than has ever been worked before. A contract has been let for a six-ft ditch from main New river to Rattlesnake bar where excellent prospects have been obtained. The Slide Creek company, on the North Fork of New river, are at work and well satisfied with their prospects.

Working Well.—Everything at Dixon Bar is working splendidly. The company has been running several days, and as an indication of the prospects it is stated that gold can be seen in the riffles. One thousand ft more ditch has been contracted for, and when completed two giants will be run, thus working to better advantage. A partial clean-up will soon be made.

NEVADA.

WASHOE DISTRICT.

Our usual Washoe letter having failed to come to hand in time for this issue, we substitute therefor latest letters received by companies in this city from Superintendents on the Comstock:

Belcher.—Letter of 26th: North incline has attained a depth of 116 ft below the 2660 level, having been sunk 25 ft and timbered 36 ft during the week. The bottom still continues in good blasting ground. To the length of the 2500 south drift 28 ft have been added, making its total length 328 ft. The face of this drift is in good working ground. Crosscut No. 4, on the 2360 level, is now in 128 ft, having made 32 ft during the week. The crosscut is passing through stringers of quartz assaying from $8 to $10 per ton, but has not yet reached the vein.

Lady Bryan.—Letter of 26th: Since last report the shaft was sunk 10 ft; hard bird's-eye porphyry, the same material now in the bottom of it. The north drift, 600 level, was extended 23 ft through porphyry full of iron with bunches of quartz through it, the same material now in the face. The south drift was extended 21 ft through quartz giving low assays, showing very plainly that the quartz is getting to the east of the drift as they go south. The east crosscut from the south drift was extended 24 ft through a mixture of quartz, clay and porphyry, the same material now in the face; everything is running well in and about the mine, the water is getting less.

Mexican.—Letter of 26th: On the 2100 level the joint Ophir upraise is up to the 2000 level, and they have commenced drifting to connect with the main north drift, which connection they expect to make on Monday next. On the 2000 level the joint Union Con. upraise to connect with the joint winze down from the 1600 level is now up 66 ft, having been extended 22 ft during the past week. The material passed through still continues in vein formation, showing an increase of water. On the 1600 level the joint Union Con. winze has been sunk and timbered 12 ft during the week, and is now 318 ft on the slope below that level. The water causes some delay in sinking, but is easily handled by the donkey pump. They are still engaged in repairing the north drift to the Sierra Nevada shaft.

Crown Point.—Letter of 28th: Since last report they have sunk the incline winze 30 ft; total distance, 180 ft, on the slope below the 2506 level. The bottom is dry ground. The joint crosscut No. 1, 2500 level, is in 66 ft. Crosscut No. 2 is in a distance of 144 ft. Both crosscuts are still in dry porphyry, neither of them having yet reached the ledge.

Bullion.—Letter of 28th: The east crosscut, on the 2150 level, has been advanced 36 ft. The formation in this crosscut is vein porphyry, with streaks of quartz. Work will be discontinued in this crosscut during this week to allow the erection of the new air compressor at the Imperial and Bullion shafts. The station at the 2150 level for the winze engine is not yet completed; work will not be discontinued at this point.

Union Con.—Letter of 26th: On our 1000 level we have sunk and timbered the joint Mexican winze 12 ft during the past week, making a total depth of 378 ft on slope below that level. The water causes some delay in sinking, but it is easily handled by the donkey pump. We are still repairing the north drift to Sierra Nevada shaft. Flow of water from east drift continues to be about 1½ inches. On 2000 level the main north drift has been extended four ft, and is now 183 ft north of our south line. The material is somewhat harder than at date of last report, showing some water. Joint Mexican upraise to connect with the joint winze down from 1600 level now up 66 ft been extended 22 ft during the past week; material continues vein formation showing increase of water. On 2300 level main south drift from Sierra Nevada incline now in 60 ft passing through vein formation with streaks of clay showing some water.

Exchequer.—Letter of 28th: During the past week our north drift has been advanced 18 ft, making a total of 368 ft. The formation is soft vein porphyry with streaks of quartz. A small seepage of water still exists, but not sufficient to interfere with work. Work will be discontinued at this point during the week to allow the erection of the new air compressor at the Imperial and Bullion shafts.

Gould & Curry.—Letter of 28th: The 1700 east joint drift has been extended 34 ft since last report. Face of drift is at present in a soft formation. Good progress is being made in retimbering the 1700 level winze station. The Osbiston shaft was sunk and retimbered 15 ft during the week; there is a stronger flow of water than at last report. The drain tunnel is in 380 ft.

Best & Belcher.—Letter of 28th: The 1700 level joint east crosscut is in a distance of 815 ft, from the north lateral drift; the face is in soft ground. We have stopped all work on the 1006 level for the present. The new joint shaft has attained a depth of 530 ft, 15 ft having been sunk and timbered during the week. The bottom is in good sinking ground. The drain tunnel was extended 30 ft; total length to date, 386 ft.

Chollar.—Letter of 26th: During the past week we have repaired 20 ft of Chollar-Norcross-Savage shaft. Water has raised 122½ ft since last weekly report, and now stands 1,804 ft below the surface, making 517 ft of water in the shaft. Temperature of the water, 127° Fahr.

California.—Letter of 26th: Shipped to-day nine bars bullion valued at $41,920.86; total to date $322,418.37.

Con. Virginia.—Letter of 26th: Shipped to-day six bars bullion valued at $20,643.20; total to date $212,344.42.

Julia.—Letter of 26th: We are progressing with the repairs on the 2000 level south drift as rapidly as the extreme heat will permit. Winze sinking from 1800 level has attained a depth of 43 ft. Continue to develop a fine character of metal bearing quartz.

Ophir.—Letter of 24th: Shipped to-day five bars bullion valued at $10,677.14.

BATTLE MOUNTAIN DISTRICT.

The Bowers Coal Mine.—*Silver State*, April 20: This mine or coal deposit was discovered by L. H. Bowers, the present owner, on the 12th of June, 1875, and filed as coal land in the United States Land Office at Elko, January 20th, 1876. At the surface it presented two stratas of coal, separated by a strata of sandstone a few inches in thickness, and these conditions have been preserved with great regularity to a depth of 180 ft, on the incline, which Mr. Bowers has sunk. The dip of the vein is about 22°, very regular, and the formation is pronounced to be of the most favorable character, consisting of slate on the under and sandstone on the upper side. At the present depth there are two veins separated by the strata of sandstone above referred to; the upper of which measures four ft and the lower two and a half ft in thickness of solid coal. H. C. Evans, of Pottsville, Pa., a practical coal miner, analyzed a specimen and pronounced it lignite of the best quality for making steam and other uses. Mr. Bowers uses it for blacksmithing, and burns it in a grate in his house with perfect satisfaction. It has also been tested by blacksmiths at Lewis and Battle Mountain, and found to be all that could be desired, burning brightly and leaving but a small quantity of clear white ash.

BELMONT DISTRICT.

Belmont.—*Courier*, April 19: All work at the mine has progressed satisfactorily with fine results during the past week. The winze has been sunk from the 300 level 13 ft in a three-ft vein of quartz, with from 12 to 15 inches of good milling ore. The winze is now sunk 56 ft, the same being in ore all the way and think there is no doubt but that this ore body will extend to the 400 level. A drift from the winze running west 50 ft below the 306 level on this ore body is to be started and continued as long as ore is found. The 300 level drift running from south raise, north end of mine, is showing two ft of quartz with a strong trace of mineral through it. Have advanced some

Continued on page 292.

The Proposed Sacramento River Relief Canal.

The Sacramento *Bee* gives ths following as the latest information upon this important puhlic work: The commissioners of the Sacramento river drainage district, Messrs. R. S. Carey, W. F. Knox and Rohert Eghert, met this morning at their office in this city, 53 J street, for the purpose of examining the maps, plens, etc., of the engineers for the proposed canal which is to serve as a relief to the river.

They found the work progressing satisfactorily under the supervision of Mr. James C. Pierson, who is assisted hy Mr. William Bassett, of this city. The chief engineer of the district is Mr. Isaac W. Smith, of San Francisco. A number of maps have heen prepared, showing the topography of the country in detail, the courses and fall of the creeks, the lins of ths proposed rslief canal, etc.

Probable Route of the Canal.

Ths engineers have apparently done their work well and thoroughly, and it is a very sasy matter for any person of ordinary intelligence to get a very accurate idea of the extent and character of the work to he done by referriug to the maps now ready for the engraver. Tns canal uuder the provisions of the act providing for its construction—is to hegin at Knight's Landing and run iu a southerly direction, on a grade that will utilize the fall of the water, until it reaches tbe "sink of Putah," when it will bear westerly and continue in a line parallel with and ahout six miles easterly from the Vallejo railroad, to the head of Lindsey slough. The course of this slough is then followed to the

Montezuma Hills.

Through these bills a cut is proposed which would be from five to six miles in length, reaching Montezuma slough at Denverton. On the line of this proposed cut through the hills the engineers hored a series of wells, 1,000 feet apart, to determine the character of soil to he encountered in making the cut, should the present survey he agreed upon. It was found to he composed of sand, clay and gravel, which will offer no resistance to the rapid progress of the proposed cut.

Much Valuable Land

Will be drained and hrought into cultivation ehould the proposed canal he constructed with the prohable changes to he suggested hy the euginecr in his forthcoming report. The fall of Putah creek, from near Greene McMahon's ranch, heyond Davisville, to "the sink" averages six feet per mile. At the latter point its hanks disappear, and the water spreade over a large basin, finally finding their way into Sacramento river through Ceche slough. There is a large area of first-class land lying between the sink and the Sacramento river, which is susceptible of heing reclaimed. About eight miles helow Sacramento the great hasin which receives the deposits of Putah and Cache creeks is divided hy a ridge and levee along Babel's slough, which extends out to what is knowu as "Willow Point" some four miles east of the high prairie land behind the town of Dixon. This ridge stops the flow of the Putah waters until the upper part of the hasin is filled, when they run out between Willow Point aud the main land and settle in aud about Big Lake, in Lisbon district, opposite Freeport. Big Lake and vicinity is

The Lowest Point

Between Kuight's Landing and the Montezuma Hills, and is in fact so far as the engineers have ascertained, within a foot or two of the low tide level of Suisun bay. If this be the case, it looks as though there would necessarily etill remain a considerahle district of unreclaimed land in that neighborhood after the canal is constructed.

The above are the principal pointe of information to be had at the present time, but the report of the engineer, which it is expected will ehortly be published, will contain everything of interest in connection with the enterprise, and will doubtless prove a very valuable document. Whether the present proposed canal shall he opened or not, the work done by the engineers will be of incalculable benefit to this part of the State, and will in time well repay for the expense incurred.

THE COMSTOCK AS A LEAD-BEARING MINE.—A French company having purchased the old Telegraph mine at Bingham, Utah, sent out a couple of experts to examine and report on the eame; which business, having been got through with, the company find themselves the owners of a very valuahle property; that is, if the report of these experts may be accepted as conclusive on that point. We had some how got the impression that the Telegraph mine was not of much account, had never yielded any large profit, had, in fact, been run with loss to the owners. However, we glad to hear that it is really a hig thing and would he inclined to endorse it as such, had not one of these experts, by shifting the Comstock over on the base range, betrayed such an ignorance of our mines as tends greatly to impair our confidence in his judgment of the matters.

THE American Institute of Mining Engineers, on Wednesday, March 26th, formally transferred its valuable collection of ores, minerals, aud metallurgical products to the custody of the Pennsylvania Museum and School of Industrial Art.

Southern Inyo.

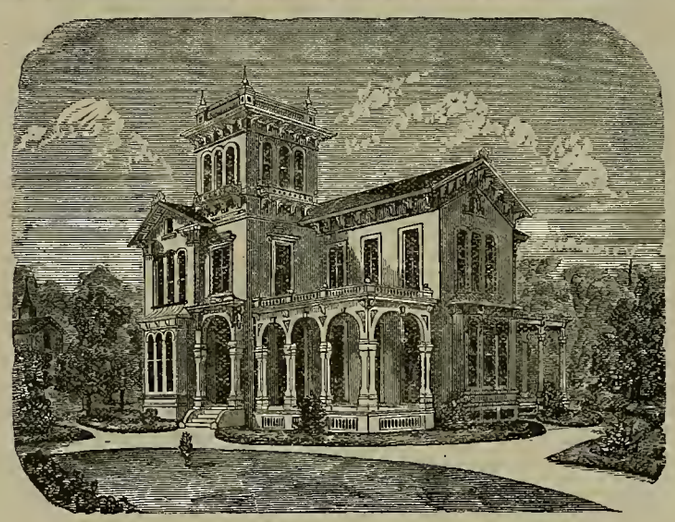
Mr. A. C. Pratt, editor of the *Carson Valley News*, recently made a trip south from Bodie, into southern Mono and Inyo counties, and in an editorial in his paper sums up his views as follows: "It is useless to dwell upon what intervenes hetween here and Bodie. Our readers are already familiar with that section and its resources. Beyond that lies a country known to be rich in mineral, to which we all look with more or less interest, and conjecture when and where tbe next great development will be made. Mining territory is becoming more circumscribed, and people realize that sooner or later this great mineral belt, extending for over 200 miles south, which has been superficially prospected and neglected for years, like Bodie, will attract the attention of men of sufficient enterprise and means to develop its merits. Our readers care little about detailed descriptions of mines, hut 'what do you think of the country?' We think it is a country of the greatest possihilities of any on this coast. The White and Inyo range of mountains, bouuding Owens valley on the east, are kuown to hs rich in hoth gold and silver, from one extreme to the other, a distance of over 150 miles. Benton, Bodie and Aurora on the north have exemplified their richness in a very conclusive manner. Indian district, on the west, has exceediugly bright prospects, and one or two paying miues—the Tower, at least, which is in the same range of hills. Further west is the Mammoth, which is reported to have recently developed an immeuse gold ledge, eight feet in width, at a depth of some 300 feet, and of marvelous richness. Down opposite and west of Independence are some valuable minee of free gold and exceedingly rich. Cerro Gordo has, and is still shipping her lead and silver bulliou, in a quiet sort of way, and almost innumerahle rich ledges of gold and silver-bearing rock have been discovered by men of small means, who have uever been able to work them, and which are never heard from except as the traveler picks up a piece of rock from soue dusty mantelpiece, sparkling with gold, and inquires where it came from, and is told that it came from a mine belonging to Mr. Joues or Smith. He asks 'what are they doing with it,' and the answer is, 'nothing; they bave not means or facilities for working it. If there is ever anything done with the mines in this section they hope to sell.' In this condition everything rests. People seem to be discouraged, and Micawber-like, are now waiting for something to turn up. They know that they have rich mines around them, but they have never yet succeeded (with the exception of Cerro Gordo, perhaps) in bringing them to the notice of the mining world. Bodie development has placed them 100 miles nearer the notice of mining capitalists, and it is not improbable that they may soon attract attentiou. If Mammoth is as good as reported, it will he another gain of 50 miles in that direction. The next step may be the Bishop Creek mines and the Independence country. Bishop Creek is oue of the most fertile valleye on the coast, and capable of supplying an indefinite number of miuing camps on either side. The climate is quite warm, but very favorable for mining and aud agriculture. Owens river supplies ahundance of water, and the Sierras, there as here, have almost inexhaustible forests of timher. We think Owens valley has a great future."

A Rural Mansion.

We give on this page a design for a rnral home which may bs pleasing to some of our readers who are comfortahly furnished with this world's goods, and desire to erect a residence in keeping with their means. The design is in the Italien style, and as may be seen by the hosts of windows it is well planned for a sunny home. It is therefore adapted in this feature to this State, for nowhere else in the world perhaps is sunlight so highly esteemed as here. There is a world of wisdom in this love of sunlight which we hold, and if we plan our houses to catch the sun, and make proper allowance for ventillation, we sball have pure air in abundance, which is a foundation stone of health. Houses range all the way from "grave to gay," from "lively to severe," in the treatment they accord to sunlight and the outer air. Our sunlight is so genial and our atmosphere sò delightful, that we can well afford to give them free ingress to our homes.

It will be noticed that the plan is well furnished with piazzas. These in our warmer districts are great treasures, although near the coast they are of less value. In the interior the shade of the piazza when the sun is high will make the lower rooms delightfully cool, and though at noon the upper rooms will be overwarm, the approach of our cool night air will dispel the extra heat and make them fit palaces for the drowsy god.

Although the design is rather plain in some features, it hes a generous outline and suggests thoughts of spaciousness. To get the best effect of the design the building should he located at a distance from the highway, and be approacbed hy paths and roadways winding among grass plots and shubbery. A grove at the rear would afford a fine background for the picture. The house is well adapted for building of wood, and would probably cost $10,000 or $12,000 if the interior be finished to correspond with the exterior. The design is by J. H. Hobbs & Son, the Philadelphia architects, and they furnish the following description of the ground plau: *A*, vestibule, 11 by 11 feet; *B*, parlor, 15 feet 2 inches by 21 feet 3 inches; *C*, library, 11 feet 6 inches by 15 feet 2 inches; *D*, dining-room, 17 feet 3 inches by 26 feet; *E*, kitchen, 15 feet 2 inches by 22 feet 2 inches; *G*, scullery, 15 feet 2 inchee by 15 feet 2 inches; *H*, china-closet; *I*, front porch; *J*, side porch; *K*, back shed; main hall, 11 feet wide.



DESIGN FOR RURAL VILLA IN ITALIAN STYLE.

GROUND PLAN.

These rooms are all spacious. Thc second floor may be finishcd into six good-sized chambers, with abundant closet room, etc.

INDESTRUCTIBLE STONE.—The quarries lately opened on Bear river contain a stone that is indestructible by fire, but eo variegated in color and stratified that it can be easily worked into mauy forms of usefulness, such as brick, furnace-liuings, etc. An incorporation has been formed, under the name of the "Stockbridge Quarry Company," which is now fairly under the way quarrying out, sawing, planing and polishing this material in any deeired shape required. The stratification admits of slabs heing taken out varying in thickness from one inch to several feet, and so soft when first exposed as to be worked with plane or saw with more ease than a pine board, but soon hardens and becomes suitable for use. It will answer for mantel pieces, table tops, countere, einks, tombstoues, fire bricks, well curbs or any other requirement that brick or marble could be put to. The stone is of many varieties in color, and takes on a very fine polish. Several orders have been made for it for tombstones, and it can be worked out almost as cheaply for that purpose as could be done with boards. Quite a demand is expected in that way. The Idaho company have used several thousands of brick, made from this stone, as a farnace lining, and the Godfrey Mining Co. is also putting it into use for well curbing. The company is now putting up a larger mill than their experimental one, which is to be driven by steam to do sawing, planing and polishing, and working the stone into such shape as customers may order.—*Grass Valley Union.*

Interesting to Anthropologists.

The *Grant County Herald* contains the following letter from Richmond, New Mexico, which will be of interest to antiquarians. A resident here, while excavating an old building for ths purpose of making a cellar, found two skeletons, one of a grown person and the other of a child. The skeleton of the grown person was found about six feet heneath the surfece of the ruins, almost intact. The skull was well shaped, except for a small protuberance ahout where phrenologists locate amativeness. Tho teeth were small and sound. Placed near the skull was found a small olla, containing what seemed to he the thigh hones of a turkey. After the skull was taken from its place, hair was discovered which on examination was found to bs brown. But when exposed a short time to the air it hecame so much dust. The skeleton of the child was found in a niche in the east wall, securely closed by a thin rock nearly two feet squars. The building had evidently heen burned at some time, as all the timbers which were used in its structure were found in e charred condition. Ths timber used was the cedar. Who were the peoplc who once must have bcen so numerous from the mouth of the Gila to its source? The whols valley at ons time was thickly studded with buildings. Nowhere is there a record of any race that had the protuberance on the skull aforesaid. At first it was believed that this was malformation caused by some accident to the skull, but eince it has been assured to be hereditary to the race. The protuberance was ehout the eize of a hen's egg. This rece cultivated tbe soil, because we find corn about the size of the small sweet pumpkin or squash seed, a seed whicb is the exact counterpart of hemp, and numerous kinds of seeds resembliug melon varieties. They had e beast of burden, for we find the teeth of some animal which must bave heen very large. The first European that visited the Gila was Father Nisa, the romancing priest, in 1539. He says that the traditions of the Aztec were full of stories relative to the old civilization, and its fabulous wealth. Historians differ in opinion, but many believe that this people were extinct before tbe Aztec race knew anything about this country. The tradition of the Apaches is that they have been living here about 900 years, snd that when they came they found the ruins about es we find them. If such is the cese, it may have heen several centuriee previoue to the arrival of the Apache, when this people ahandoned the country or were destroyed.

The Vancouver Gold Field.

It has heen known hy some persons ever since the exciting mining times of 1857 that there wes more or less fine gold existing in the smell streams running througb Clarke county to the Columbia, but in their anxiety to make big hauls, the miners all went to the mountains, abandoning the fields where gold was known to exist. Last October, Hein Kulper, an old miner, and J. O. Smith, hoth residents of this city, went out to prospect Burnt Bridge creek, which empties into Vancouver lake, two and one-half miles north and west of this city. They finally set some sluice boxes on land belonging to M. Wintler, Esq., and when the rain would permit, worked off and on for a month, just long enough to clean up a couple of times and demonstrate that there was pay in the dirt. They labored under eome difficulties, as the fall was slight, the weather bad, and the tailings had to he ehoveled out, but they made about $3 a day to the man. Thie set of owners of lands on the creek bottom to thinking, and among them George Tooley went prospecting on the piece of ground nearest the lake, below all the others. He soon demonstrated that there was good pay in the bottom, and continued at work running a ditch to get water, wheu Portland parties heard of the discovery, and came over to look after it. For several weeks negotiations for the purchase of the property by these Portland parties have been going on, and last week a bargain was concluded, the Portland men agreeing to pay $10,000 for Tooley'e property and putting down $600 forfeit to secure the purchase. They also purchased T. J. Wilson's land above the Tooley farm for $2,200. Tooley still retaims the piece above the road where he resides, which is as rich in gold as any other part of the bottom. Whether any mining operations are to be carried on this season by the Portland parties we have no information. Although the existence of these paying diggings hae been known here all winter, no public mention has been made of it for the reason that it would do no good to create an excitement thet would fill the country with a lot of needy adventurers, who could do nothing on their own account, as every availahle foot of mining ground was held by farmers and land owners, without whose consent no mining could be done. Now the field will be developed, and it is certaiu to pay well, without bringing with it the evils of a mining excitement. One or two old miners from the upper country have signified their intention of prospecting the country nearer the mountains this season, and they will find, as Vancouver men have found hsfore them, a ehow in many places, and psrhaps good mining ground.—*Vancouver Independent.*

Agriculture in the Government Surveys.

Our friend, Dr. Sturtevant, of the *Scientific Farmer*, brings forward an important matter when he laments that the government surveys of our vast territorial regions have almost wholly ignored the gathering of important data concerning the agricultural resources, adaptations and possibilities of the new lands which they have traversed. It is true that many of the reports have contained allusions to agricultaral values, but they have been in the main hasty generalizations, wholly subsidiary to the purely scientific investigations which occupy the leading place. The crowning work of the Hayden survey, the atlas of Colorado, it is true, makes more pretentious to industrial value and awards the subject one of its superb maps. Perhaps the failure to give industrial resources the attention they merit, has been owing to the fact that these surveys have been planned and executed by men who thought but little of industrial matters, but it has been a mistake nevertheless, and one which should be corrected in the future work of the government. We agree with Dr. Sturtevant that the scientific value of the explorations should not be reduced, but there should evidently be grafted upon them industrial features. It is true that the gathering of abstract scientific truth is a deed worthy of public patronage, but where it is evidently to the interest of the country to have these waste places utilized and populated, and as the money to execute the explorations comes from the devotees of industry rather than of science, it is plain that facts for practical use should at least stand upon a par with abstract researches.

This boon to workers has, in the case of several prosperous States, been secured by surveys under State patronage. In our own State an industrial survey, as urged by Prof. Hilgard, finds approval among many people. But the new regions which are in the main, the property of the general government, must be made known by the government surveys. It is certainly as much to the interest of our whole people that a new and valuable stock range should be as thoroughly studied as a glacier, and that the irrigation capacity of a river in a dry land should be estimated as carefully as the hight of a mountain. That these facts have not been set forth has been a sin of omission. What has been done is perhaps well, but the other should not have been left undone. In making up an expedition staff, place should certainly be made for men of experience and judgment who could set forth industrial values, while their scientific colleagues were measuring triangles, mapping moraines, bagging buttes and studying ethnology in Indian bones and relics. As a new regime has now been arranged by Congress for future governmental exploration, it will be timely to expand the fundamental plan of these public studies so that points of direct importance to the whole country shall not be neglected.—*Pacific Rural Press.*

The San Francisco *Call* says that the line proposed as the extension of the Central or West Side railroad has been definitely located, excepting at one or two points, and the right of way secured, excepting in cases of a few land tracts owned by non-residents. For the privilege of passing over these lands, the company may be compelled to sue under the law condemning rights of way. In any case, the progress of the work will not, in any way, be hindered. The contract for the grading of the first 10 miles of road from the present terminus at St. Joseph, in Yamhill, to Amity, in the same county, has been let, and work is progressing fairly, considering the state of the weather. Another contract for grading from Amity south will soon be let. The sites for the bridge across the north fork of the Yamhill have been built, and butts set up and piles driven for a pier on the west side of the main stream. The work of driving piles for the bridge to span Cozine creek, near McMinnicke, will commence in a few days. Almost all the timbers for the large trestlee and for truss bridges of the northern part of the road are framed. Over 17,000 ties have been completed, and a special train is now engaged in carrying them to St. Joe, where they will be sent out by construction cars as required. The construction, passenger, baggage and box cars are progressing rapidly at the machine shops of the Oregon and California Railroad Company. The first vessel, with 1,600 tons of iron, left Philadelphia on the 26th of February, and other lots of rails, with car wheels and axles, have left by vessel for San Francisco, from whence they will be shipped by steamer to this city. Another large lot of wheels, axles and other materials for car construction will arrive by the *State of California*, now on her way to Portland from Philadelphia.

Utah and Northern Extension Railroad. This road is completed as far as a point four miles beyond Eagle Rock. This makes the entire length of the water 217 miles. Of this 26 miles have been laid since the 26th of February last, and the road is now about four miles from the point where it will cross Snake river. For this last named point the road has been vigorously pushed since the recommencement of work this spring, with a view to its early completion in order that the iron bridge, now being built East, could be shipped over the road and laid across the Snake river before the month has passed.

Useful Information.

Sights Seen from a Railroad Train.

Some new optical delusions have been described by Dr. L. P. Thompson. Those connected with the railroad may serve to relieve the tedium of travel by affording an agreeable exercise to the mind in endeavoring to explain them. When a landscape is observed from a moving train, all objects to the remote horizon appear to be passing in the contrary direction, those nearest having the greatest velocity. Consequently, if the attention be fixed upon any object at some distance from the line, all objects beyond will relatively appear to be moving foward with the train, while objects nearer appear to be moving backwards. The combined effect is to make the landscape appear to be revolving centrally round whatever point we fix our attention upon. Rain seen from a moving train always seems to be falling obliquely (except in a very strong gale in the direction of the train's motion) in a direction opposite to that of the motion of the train. But if another train happens to pass in the opposite direction, and we look out at this and follow it with our eyes, raindrops falling between the two trains will seem to be flying forward with ourselves. If we stand upon a platform of a station and watch a train approach, the end of the engine appears to enlargo or swell as it approaches, and occupies a larger area of the field of vision. Conversely the end of the last car on a returning train appears to shrink down and contract as it diminishes in apparent magnitude. An observer at some slight elevation above a railroad, seeing two trains pass along simultaneously in opposite directions, will receive the impression of one long train moving round a circle.

Art as an Aid to Industry.—A mechanic working in the blacksmith's shop of the Phœnix Iron Company, at Phœnixville, Pa., visited the Pennsylvania Museum and School of Industrial Arts in Memorial Hall, and took a fancy to the quaint and beautiful work in wrought iron there exhibited—vines, flowers, tendrils, and leaves, wrought by hand on the anvil by the skilled smiths of foreign lands. He not only admired them, but saw in that sort of work the opening of a profitable industry. So at night, in his own house, at a forge improvised for the occasion, he and his brother worked out designs in forged iron—oak leaves, acorns, and the like. Having finished his work, he took specimens to the trustees of the museum, told what he could do, and borrowed models for the continuance of his work. There is already a considerable demand for such ornamental iron work in the decoration of buildings, and it is safe to predict for the new industry and its originators a successful and profitable employment.—*Scientific American.*

To make a Razor Strop—Select a piece of satin, maple, or rose wood, 12 inches long, 1¾ inches wide, and ⅜ inch thick; allow 3½ inches for length of handle. Half an inch from where the handle begins, notch out the thickness of the leather so as to make it flush toward the end. Taper also the thickness of the leather; this precaution prevents the case from tearing up the leather in putting the strop in. Then round the wood very slightly, just enough (say one-twelfth of an inch) to keep from cutting by the razor in stropping and turning over the same. Now select a proper-sized piece of fine French bookbinder's calfskin, cover with good wheat or rye paste, then lay the edge in the notch, and secure it in place with a small vice, proceed to rub it down firmly and as solid as possible with a teeth-brush handle (always at hand, or should be), and, after the whole is thoroughly dry, trim it neatly and make the case.

Emery Belts and Wheels.—A correspondent says that most users of emery belts and emery wheels do not use glue that is thick enough, fearing it may chill before the sand or emery can be spread. In making an emery wheel or belt, if the cloth has never been glued, it should be sized with glue about as thick as lard oil, and allowed to dry thoroughly before applying the glue which holds the emery. Have the emery heated to 200° Fah., and coat the belt or wheel with glue about as thick as molasses and roll it in the hot emery. If a wheel or belt thus treated is allowed sufficient time to become thoroughly dry it will be very serviceable.

Cleaning Sponges.—A gelatinous substance frequently forms in sponges after prolonged use in water. A weak solution of permanganate of potassa will remove it. The brown stain caused by the chemical can be got rid of by soaking in very dilute muriatic acid. An old and dirty sponge may be cleaned by first soaking it for some hours in a solution of permanganate of potassa, then squeezing it, and putting it into a weak solution of hydrochloric acid, one part acid to 10 parts water.

Simple Mode of Silvering Metals.—Small articles may easily be coated with silver by dipping them first into a solution of common salt, and rubbing with a mixture of one part of precipitated chloride of silver, two parts of potassa alum, eight parts of common salt, and the same quantity of cream of tartar. The article is then washed and dried with a soft rag.

New Nickel-Plating Solution not Patented.

In view of the recent decision in regard to nickel-plating, the following information from the *Manufacturer and Builder* may be found of useful interest:

Messrs. Boynton, Wiler & Co., in England, have for sale a new nickel-plating solution, which they confidently recommend for the following reasons: 1st. It is a solution of the double salt of cyanide of nickel and potassium, and consequently not a solution which is used and prepared by the alleged Adams process. 2d. It will plate on all metals directly, including zinc, lead and solder, and penetrates deeply into the pores of the cathode, thereby preventing oxidation. 3d. It will positively plate three times faster than any known process; sometimes in about eight minutes. 4th. It never requires a special regulation by electricity, thereby preventing the burning of the smallest articles by the strongest currents. 5th. Articles to be plated never become injured from oxidation in the solution. 6th. It produces a coherent, tenacious and flexible deposit, superior to any known to science. 7th. No acid dips are required for any kind of work, while Dr. Adams claims that acid dips are very essential for good results. 8th. The expense of keeping the solution in perfect working order does not exceed $5 per 100 gallons per month, if ordinary care is used, as in all other solutions.

They are prepared to sell this solution on favorable terms, thereby dispensing with the license or royalty business altogether.

Cement for Joining Metals with Non-Metallic Substances.—To obtain a cement suitable for joining metals and non-metallic substances, mix liquid glue with a sufficient quantity of wood-ashes to form a thick mass. The ashes should be added in small quantities to the glue while boiling, and constantly stirred. A sort of mastic is thus obtained, which, applied hot to the two surfaces that are to be joined, make them adhere firmly together. A similar substance may be prepared by dissolving in boiling water two and one-fourth pounds of glue and two ounces of gum ammoniac, adding, in small quantities, about two ounces of sulphuric acid.

Wax Pencils.—Now that such enormous deposits of mineral wax have been found in Utah, it may be of interest to point to a minor use of this substance for wax pencils, which, it is stated, are made by an Austrian firm, Messrs. Ofenheim, Griffen Co., for marking and writing on all kinds of wood, linen, cloth, and paper, and as a substitute for chalk for blackboards. It is stated that the marks with these pencils are not obliterated by moisture or rubbing, nor are they affected by acids.

Grease-Spots on Clothing.—In using benzole or turpentine, people make the mistake of wetting the cloth with the turpentine and then rubbing it with a sponge or piece of cloth. The only way to radically remove grease-spots is to place soft blotting-paper beneath and on top of the grease-spot, which spot has first been thoroughly saturated with the benzole, and then well pressed. The fat gets now dissolved and absorbed by the paper, and entirely removed from the clothing.

Good Health.

Care of Children's Eyes.

It is no uncommon thing now to see, or hear of, mere children using eye-glasses, because of some defect of eight. Myopia (for near-sightedness) is the most common defect, and it is said to be manifestly increasing among school-children, in other countries as well as in our own. The eyes of studious children are especially liable to suffer. Reading tires weak eyes, and eyes grow weak or diseased from too steady application to books. There are many disadvantages connected with learning the alphabet in very early childhood, and danger to the sight may be reckoned among them. The eyes of children, like all their other organs and faculties, are adapted to the study of natural objects, or the phenomena of the world into which they have lately come. This study is play to them, and tends to a healthy development of both mind and body. Their introduction to the fine long lines of little black letters in print should not come too early, or too rapidly—not until a love for nature and a faculty for observation have been so cultivated that reading will not be immoderately attractive. Then they must learn to read and study in a proper light, one that shines upon the book or paper, and not directly upon the eyes. A hanging lamp is much to be desired, and those who read in the evening can sit so that the light comes down upon the page from behind them. In gathering about the evening lamp upon the table, those who read should sit so that the light shines upon the hook or paper from over the shoulder—the left shoulder if practicable. The eyes suffer severe strain from reading when lying down. One who is too tired to sit up, is too tired to read. When the body is enfeebled by disease, the eyes are weak sympathetically and should not be allowed close application. Reading in railway cars, or in any place where it is impossible to keep a steady focus for the sight, causes strain and injury to the eyes. Children should be taught to avoid all these injurious practices. Most of the youthful cases of near-sightedness are those who begin to learn piano-playing when quite young, and it seems that the fixing of the sight upon the notes, while the energies are at the same time bent upon the schooling of the fingers, has a peculiar tendency to develop near-sightedness. Ought not a child's music lessen to be made very short, and the hours of practice few and of brief duration? We think so not only for the sake of the eyes, but also for the sake of the spinal column and the nervous system.

Bad Temper and Insanity.

Says the *Popular Science Monthly:* Passionate people—the hasty kind—who flare up in a blaze, like fire to tow or a real to powder, without taking time to inquire whether there is any ground for such a pyrotechnic display, and then get more furious when they find out there was no cause for their fiery feats, may learn a useful as well as a serious lesson from an item in Dr. Blanchard's report of the King's County Lunatic Asylum, that "three men and three women became insane by uncontrollable temper."

We all feel a sympathy for one who has become demented from loss of kindred, from disappointment, and from a hard lot in life; but we can have no such feeling for quarrelsome, ill-natured, fretful, fault-finding, complaining, grumbling creatures, the greater part of whose every-day life tends to make those whose calamity it is to be bound to them, as miserable as themselves. Bad temper is a crime, and, like other crimes, is ordained in the course of nature, to meet, sooner or later, its merited reward. Other vile passions may have some points of extenuation, the pleasure, for example, which may attend their indulgence, but ill-nature—that is, a fretful, fault-finding spirit, in its origin, action and end, has no extenuating quality; and, in the application of the old principle, "with what measure ye mete, it shall be measured to you again," will find a most pitiable end. Therefore, with all the power that has been given you, strive and strive for life, to mortify this deed of the flesh. Watch hourly, watch every moment against the indulgence of a hasty temper, as being offensive to yourself and contemptible in the eyes of your fellow man—contemptible, because for the person who possesses it, and knows it, yet indulges in it, and makes no effective efforts to restrain it, no human being can have any abiding attachment or respect, founded as it is in low morals, or low intellect, or both.

Preventing Seasickness.—Of the many annoyances to which the traveling public is subject at this particular season, seasickness is, perhaps, the most distressing. A perfect cure for this malady would rob ocean travel of half its terrors. No drug, however, has been discovered which acts as a specific. The cause of the sickness is largely, if not wholly, due to the involuntary and unexpected motions to which the passenger is subjected on board ship. These cause undue pressure upon the stomach and liver, and derange the action of those organs. To prevent this, attention has recently been called to an old plan, which is said to be very successful. It consists in regulating the act of breathing according to the pitching or rolling of the vessel, drawing in the breath as she rises, and breathing out as she falls into the trough or the waves. After a little experience the practice, it is said, becomes involuntary. When seasickness has fairly set in, the only thing to be done is to get rid of the extra bile thrown into the circulation, and to allay the irritation of the stomach. For the latter, brandy is the popular remedy, but cool, effervescing drinks are preferable. Champagne is recommended as the best medicine to subdue nausea, and give the necessary tone to the system.—*Scientific American.*

Gases of the Stomach.—In a paper recently read before the Paris Academy of Medicine, the author expressed the opinion that food does not produce gas, and that the gases which are found in the digestive tubes proceed from the external air, the blood and fecal matter; these gases are continually put in motion by the pathological contractions of the muscular fibers of the intestines; expelled by the mouth, they are constantly renewed, and their production may be as incessant in a starving man as in one who is well fed. This symptom of production of gas, therefore, signifies an irritation of the stomach, which is always consecutive to a long-standing gastric dyspepsia. No therapeutic agent need be sought to combat these gases.

Preventives of Lead Colic.—If working in lead, wash the hands several times a day in a strong decoction of oak-bark. Keep the hair short, and (if a painter) wear a clean cloth cap. The clothes should be frequently washed, and the hands also, especially before touching food. Before eating the mouth should be rinsed with cold water. A weak oak-bark decoction should be used as a wash several times a week. The body should be sponged night and morning with cold or tepid water, and the hair thoroughly washed every evening after work. The food should contain a large proportion of fatty substances, and milk should be taken in large quantities.

The Week.

With tbe near approach of the Constitutional election interest rises to a fever heat, and men of all parties hrace tbemselves for more energetic efforts in furtherence of success and remedy of failure. Which ever way the election goes tbe prospect for California, and for the Pacific coast generally, is a hopeful one. From the propitiousness of natural agencies our prosperity is generally assured. The abundant rains and past good weather have made a bountiful grain crop certain. But it is in mining that the improving outlook is most apparent.

True, stooks are down, but this is not always an unfavorable sign. Without doubt the legitimate field of mining is widening every day. From all our States and Territories come news of extensive prospecting, location of new districts, opening of new mines and large increase of bullion products. The hydraulic miners are especially favored in the unusual ahundance of water. The severity of winter which has so impeded the fall development of many mountain camps, has gradually passed into the more favorahle weather of spring; and from them also the chorus of drills and sledges and of blasting thunder resounds with loudly increasing vigor.

LIEUT. WILLARD YOUNG and command have resumed the work of surveying Great Salt Lake, at tbe place wbere it was discontinued last year.

THE Reichstag has voted the eum of 1,830,000 marks for the further coustruction of subterranean telegraph wires in Germany.

QUEEN VICTORIA has left Italy for England.

A Word More About Investing in Dividend-Paying Mines.

Certain of our Eastern contemporaries affect to regard it as a little strange that the PRESS should have thought it worth whils to caution investors abroad against buying the sbares of dividend-paying mines on this coast. Our remarks in this connection were intended to not exactly discourage the purchase of such shares, but to suggest that the buyers look out that they do not pay too high prices for them under the impression that these dividends are to bs indefinitely continued. We have mines that for a long series of years have yielded steady profits; but they have not generally been listed at tbe etock boards here or elsewhere, nor are their shares in a public way at all dealt in. With the properties that have attracted wide notice through the disbursement of large net earninge and extensive transactions on the stock exchanges the dividend-paying era has not been protracted. These properties have not, in fact, remained long in bonanza. With our exhaustive system of mining this was impossible. The enginery we employ does its work too rapidly. What ore body could long hold out against the depleting forces of these modern agencies and appliances! One after another every dividend-paying mine on the Comstock has by this intensified and energized process been forced over the dead line, there to remain till it recovers the function of profitable production. During the past twenty years a full dozen of these properties have in this manner been relegated to their first sterile and profitless condition. With deeper exploration some of these mines will be restored to prosperity, while others will probably be marked by such persistent barrenness, as will lead at last to their entire abandonment.

And so of our fertile mines elsewhere: attacked in such force their resources must soon show signs of failurc, if they do not wholly give out. So far as the stock of ore in a single mine or many mines is concerned, it is merely a questiou whether, through the employment of these improved mechanisms and methods, it shall be speedily used up, or whether by an adherence to the old ways and meaus its life ehall he extended. If our ore-bearing deposits were few or of limited extent, it might perhaps be best to slacken our pace and be a little more guarded against their waste. As it is, however, with the material in such exhaustless quantity an opposite policy would no doubt be the best, as it certainly is the one which we shall continue to pursue—going on as we have begun, driving this business under high pressure, delivering our mines by the Cæsarean process, and leaving dividends the magnificent hut cvanescent thing tbey are at prcsent. We can take no backward step in this industry. We shall go on doing our lifting and pumping with great hoisting works, performing with a single engine a service for which in the Spanish American mines an army of pcons was required. Our capacious mills will continue reducing the ore for which in Mexico alone 14,000 mules were kept to drive the arastras and tread the patios. Our motto in the future as in the past will be onward and downward, paying dividends when the mines can earn and the mauagers deem it policy to spare them.

To invest in the shares of some of our non-dividend paying mines might not just now be such a dangerous experiment. Certain of these properties under very thorough exploration afford signs of approaching ore devclopments, which should they be realized would cause the price of these shares to advance rapidly. Eastern investors put their money into railroad, coal and other stocks that not only afford no net revenue, but which can in no event be expected to make any great advance on the figures at which they are now quoted. Nor are these stocks free from fluctuations, sometimes quite as extreme as anything ever seen in our mining share market. Shares in the New York Central and Hudson River Railroad, accounted a standard stock the world over, fell ten years ago in a single montb from $192 to $85. The stock of the Panama Railroad, another favorite, stood at $369 per share in September, 1868, and at $49 in June, 1871. Toledo & Wabash Railroad shares fell from $88 in August, 1869, to $1 in July, 1877, and hundreds of other examples of like purport might be quoted. Even gold under the manipulations of Eastern epeculators has been made to tumble at a fearful rate in the short space of 24 hours.

But, after all, we rather incline to the opinion lately expressed by us, that parties in the East desirous of becoming interested in our mines had better engage in the business in a practical way, going in as we do here on the hedrock principle. Let them buy or hunt for mines, and having secured them, open, outfit and work them, taking the chauces of their proving remunerative or a failure. The business is not now attended with much hazard; it can, in fact, by proper care, be made a very sure one. The field is large and open to all. It has been well explored, our pioneer prospectors having penetrated to the remotest parts of it. There is safety everywhere. The dangers that attended early exploration have disappeared, and even the difficulties that at first beset the business have been greatly diminished. The ground has been cleared ready for the planting, and a great harvest awaits those who ehall come to seed it. The stranger should repair first to San Francisco, get posted and then strike out in almost any direction, for go wbich way he will he can hardly go amiss. Our mineral regions stretch interminably away to the north, east and south of us, and from this point can be penstrated for many hundred miles by rail, which besides expediting travel and promoting comfort, greatly lessens the cost of transportation to the interior, hefore one of the heaviest burdens of mining.

Notes on Trinity County.

A Prosperous Year—A Large Out-put of Bullion—New Enterprisee, Etc.

From an old and well-knowu resident of Trinity county, who called upon us the past week, we have been able to gather some very acceptable intelligence touching the condition and prospects of the various branebes of miniug in that remote section of the State, and from which it is not always easy to obtain very full informatiou through ordinary channels. This, in the opiuion of our informant, is likely to prove an exceptionally good year for the mining industries of Trinity, for, while the rains were delayed two months later than usual, more than the average amount of gold dust will be taken out the current year, as the weather of late has been extremely favorable, and a number of new hydraulic mines have this season come into the field as hullion producers. The annual yield of gold in this county has, one time and another, fluctuated considerably. At first it amounted to over $3,000,000. This was when the mining population was large, and extended from 1850 to 1854; after which the yearly out-put gradually fell off till it reached scarcely more than $1,000,000. Some five or six yeare ago the bullion product began to increase, and for the past two or three years has averaged very nearly $1,500,000. It is generally expected that it will thie season exceed that sum, and that the increase will, for several yeare to come, be quite rapid. Next year they count on $2,000,000 at least, many fixing the eum at $2,250,000. The total production of Trinity county to date approximates $100,000,000, ranking it about the seventh or eighth on the list of our bullion-producing counties.

The Quartz Minee.

Besides the additional hydraulic claims that will, for a number of years, continue to be outfitted and set to work, quartz mining in this sectiou of country is destined to grow very eoon into au important factor in bullion production. It is only four or five years eince any attention began to be paid in Trinity to this branch of mining, and, although no very big mines have since been developed nor extensive mills put up, the business is in an excellent condition, as much so, probably, as in any other part of the State. This class of minere have had no aid up there from outside capital, nor, for that matter, have they had any pecuniary aid from home sources, not having asked for nor required it. The auriferous lodes, so far as discovered, do not appear to he very widely distributed, their occurrence in large numhere and marked strength being confined to a few localities; the most noted consisting of the Bullychoop, the Deadwood, and the Eastman Gulch districts. At these places the lodes, without being very powerful, are well formed, and at a depth of 200 feet show themselves regular and persistent, conforming, in fact, to all the geological requirements of true veins. Tbe ores are free milling, and, worked in arastras, have yielded from $30 to $100 per ton; averaging at least $70 per ton. Only one or two small mills have yet been put up, the miners preferriug to work their ores in arastrae till such time as they have fully tested their lodes and determined their capacity for ore productiou By pursuing this policy they have opened their mines to a considerable depth, know just what they have got and what they want; have made some money, are out of debt and own their properties wholly themselves. No parties have lost any money in quartz mining in Trinity. They have no deserted tunnels, ruined hoisting works nor great crushing mills standiug idle up there. There is also an absence of incorporated companies with millions of capital stock, assessing shareholdere and wasting the money iu a thousand questionable ways. Many of the quartz miners now require hoisting works and some increaee of milling capacity, but they will he able to provide these themselves, and mostly from the net earnings made from their mines.

From this showing it would certainly look as if quartz mining in Trinity was in a healthful condition. There might be some inducements for parties with larger means to engage in the business there; but they are not great, the lodes and the ores heing of such character and the natural facilities so good, that the locator is able, as a general thing, to work them succesefully on his own account. In the future this business will no douht continue to advance with a slow and steady pace, reaching ultimately very respectable dimensions. Quartz can be mined and milled in that county as cheaply as anywhere else on the coast, tbe country beiug well watered and timbered, and the climate such that operatione can be successfully prosecuted at all seasons of the year.

Hydraulic Mining.

The most of the placer mining in Trinity is done by the hydraulic method, which is now in use throughout a belt of country stretching along the Trinity river for 60 or 70 miles. Never has there been greatsr activity in this branch of the business than at present. Every company has plenty of water, and all are running day and night, week days and Sundays—hydraulic miners, nowhere, in fact, suspend work on the ssventh day during the water season. So auxious have the Trinity miners shown themselves to make the most of the water while it lasts, that some of them have not evsn stopped to clean up, none having done so this spring as often as usual. Ths result has been, that whils mors gold dust is being taken out, less has bssn shipped than in ordinary years. Business, however, is good, prosperity with the miners meaning there prosperity for all. At this time thers are but few idle men to bs seen in Trinity; all are busy, either running their own claims or working for others, lahor being in active demand at fair wages.

Some of the Live Mines.

Among the more largely producing hydraulic compauies iu this county are the McGillivray, the Weaverville ditch, the Buckeye Mountain, Oregon Gulch, Dixou'e Bar, etc., each of whicb cleans up yearly from $20,000 to $80,000, three-fourths of it being net profits. A good part of the Dixon's Bar Company is made np of residents of Oakland. They built a ditch and opened and outfitted their ground last year at considerable expense. They are now washing with a full head of water, and cannot fail to do well, as their gravel is known to be rich. The Buckeye company, who own a splendid water right, have also completed a large ditch delivering water upon their extensive gravel claims. Some portions of tbeir ground, more especially that at Boalt'e hill, have in times past been distinguished for an immense production of gold dust. But the great body of their richest gravel has not yet been reached, and cannot be until the tunnel now being driven is completed. When this work is finished it will probably open up one of the most fertile cbannele ever explored in Trinity county. Aside from this the company own eeveral hundred acree of deep gravel banke that everywhere ehow good hydraulic proepects.

New Enterprisee.

On tbe lower Trinity a number of new projects are about being carried out, eome of whicb are of considerable magnitude, and when completed will greatly increase the bullion product of the county. The Slide Creek company are building a ditcb and flumes for taking water from the main river and conveying it on Rattlesnake bar, where they have a large amount of rich gravel through which an old buried cbannel is supposed to run. They have a sawmill which cuts all the lumber required for tbeir various purposes. Another party in the same nighborhood will soon begin cutting a ditch also to take water from the eame stream and deliver it on a bar at the mouth of Slide creek, where extensive washing operatione will be carried on. This bar containe 25 acree of good gravel ranging from 30 to 60 feet in depth. This water will be taken across the Trinity in a flume supported on trestle works. Two or three smaller companies are in like manner engaged here bringing water upon their claims, taking the same from either the main river or some of its emaller branches. The most important enterprise lately set on foot in this vicinity is, however, one deeigned to introduce a heavy stream of water on

Taylor's Bar,

An extensive body of gold-bearing gravel lying on the east eide of the lower Trinity, about 36 miles northwest of Weaverville. This har has always been noted for its richness, the gravel yielding a higher percentage of gold than almost any other along the river. Being owned, however, by one of the old-time minsrs who lived upon it with his family, content so long as he got enough from it to afford him a comfortable subsistence with little labor; it has remained up to the present time in very nearly its original condition, just enough work having been done to prove its value without diminishing to an appreciable extent its productivs capacities. This bar covere an area of some 160 or 170 acres, two of the buried gold-bearing channels running its entire length, with a third lying a few hundred feet further back and at a higher level, but within the limits of the claim. These channels have been opened with tunnels and proven to be of the most fertile character, the dirt taken from them yielding from $5 to $10 to the cubic yard. Not long eince the former owner of this property, E. B. Barnum, not foreseeing the great impetus likely so soon to be given to hydraulic operations on the lower Trinity, disposed of the eame to Eastern purchasere for $125,000, the principal huyers being residents of Indianapolis. It is a property that, in the opinion of our informant, never ehould have gone out of the hands of Californians, and would not, if they had been alive to their own interests. It is the case, however, that Californians too generally want only mines suited for epeculative purposes, to whicb these gold-giving hydraulic hanks are not well adapted. There is not enough of the element of hazard about them for this. It is not convenient to go long or short, or to effect corners on the shares of mines that yield with so much steadiness and certainty. But it matters not to the Trinitarians who gets possession of these lifeless claims—animates and spends money on them, and thereby enlivens trade and invigorates business generally; securing for themselves in the end large and lasting profits. The gold is in these bars along the Trinity. For 30 years

the old crop of miners thers have been well aware of this fact, but they havo not had the energy to open up these deposits and bring water upon them. If now other parties will coms in and accomplish this work, it will he for ths good of all, as its performance will necessitats the sxpenditure of money, create an additional domand for labor, and return a thousand fold to the investors.

Importance of Beginning Right—A Man Who Knows His Businees.

This property was hought for these Eastern parties by I. M. Taylor, a wsll-knowu mining expert in his city. It is not from him, however, that the bar derives its name. It was callsd after an early pioneer on the lower Trinity, and who having bsen among the first to work on this har left it ths heritage of his nams, while he, after haviug enriched himself drifting out the dirt along its edges, floatsd away into the forgotten aud unknown. Our San Francisco sxpert having bsen callsd upon to take a look at this grouud, wsnt up, examinsd it carefully, and without dickering or asking qusstions took it so quickly that the old man Barnum had not time to advancs his price, as his neighbors thought he ought to have done.

Appurtsnant to this ground is a franchiso to the entirs waters of Frenoh creek, a large stream hsading in the Salmon mountains and emptying into the Trinity a little above Taylor's bar, an appendage that alons is worth more than the present owners gave for ths whole property. If Taylor's har, with this water right and the rich gravel it commands, wers located in Nevada, or other of the mors contral mining counties of the State, it would be considered cheap at three or four timcs the price givsn for it by these parties. But it is worth none the lese where it is, as rssults will prove when the water of French creek shall begin to do its work on the auriferous banks and along the old channels of this splendid property. So much for sending the right kind of a man to do thie sort of work, the most fatal mistake made by mine investore lying usually at the very threshold of proceedings. If a miniug property be devoid of solid merit, or if a price be paid for it greatly dieproportioned to its actual value, it is vain to hope for a favorable issue, however ably and economically it may afterwards be managed. Hence the importance that these errors be at the start duly guarded against. I. M. Taylor went to Trinity several years ago, and was alike fortunate in pointing ont some of the best things there. He was the first man of advanced ideas to visit the Altoona cinnabar district in the northern part of the county, the subsequent history of which has fully verified what was said by him on a subject then so little understood.

The new proprietore of Taylor'e bar have already taken active measures for equipping the ground and bringing water upon it, and as they have ample means they design doing this work in a manner superior to anything yet seen in that part of the country. The services of a capahle and experienced euperintendeut have been secured, the surveys for the new ditch are under way, and preparations being made for the erection of a sawmill for cutting the lumher required for flumes, sluices and other purposes. These works will be pushed to completion, including the cutting of a large sized canal, as rapidly as possible, aud with a view to having the whole ready for active use by the commencement of another water season, when it ie expected that such clean-ups will be made here as will astonish even "old Trinity." While there are still good openings for the investment of money in gravel mines up there, they are not numerous, the water being all taken up and minersas a general thiug holding their claims at pretty good prices.

A Mountain Sinking.—It is not uncommon in the Gulf and Southeastern Atlantic Statee for large bodies of land to eink below their original levels, but such phenomena have generally occurred in the low and sandy countries. The Toccoa (Georgia) *Herald*, however, reports the subsidence of a whole mountain in that country which is composed of, at least, half rock. A heavy storm was felt on the 20th of March accompanied by thunder and lightning and a terrible ehaking of the ground. Immediately following this, it was found that the whole north side of Chattoogo mountain, sloping down at an angle of 45 degrees to the Chattoogo river and 1,200 feet in hight, was gradnally sinking. There was a break near the top, and at one point, over the top of a eloping ridge, a perpendicular rock showed itself, the depth of which was about 16 feet and the extent 30 or 40 acres. The bank was in the form of a horseshoe, the toe being at the top of the mountain. Trees were standing with their roots up, and large stones cast out upon the surface. About three years ago an earthquake cracked the mountain at the point where the present break occurred, but no notice was taken of it at the time. Some fear is manifested by the inhabitants as to the resulte of this subsidence and the depth to which it may extend.

A man was arrested in San Francisco for offering to sell 60 votes to be used as the purchaser might desire.

R. D. Hume will contract to put 3,000,000 salmon into the Columhia annually, for ten years, at $5,000 per year.

The total insurance on the loss by the Eureka fire foots up $136,087.

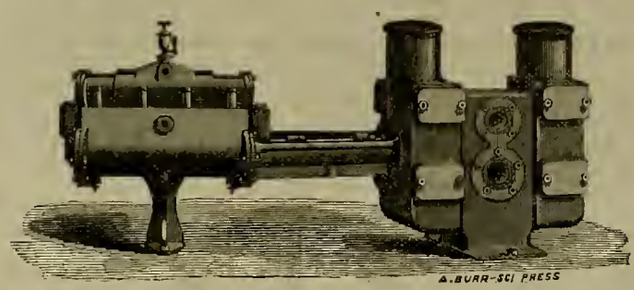
Dow's Improved Steam Pump.

When direct acting steam pumps (or suob as did not reqnire au eccentric to move the valve) cams into use, it was deemed sufficient if the piston could be made to reciprocate with a distant approach to certainty of action, wbich would not now be tolerated; it being held only reqnisite that it would continue working under the constant eye of an engineer without much of any variation of duty or coudition. As use and experience increased, improvements were suggested and made as new requirements developed thsmselves, until we have now several recognized makers of direct acting steam pumps which are generally accepted as the standard.

In making thcse pumps, all the makers have followed one direct principle—that of operating the main or auxiliary valve by means of positive contact through intermediate mechanism of reciprocating pistons or connections with the main or auxiliary valves. While thie has given positive movement to the valves, yet it has been impossible to adjust this line of contact to meet the reqnirements which are shown under variations of work or steam pressure. That is, without mechanical adjustment, the time of contact of operating parts is (not allowing for lost motion by wear or otherwise) when the piston is at a fixed distance from the end of its stroke; and this, although the pump may act comparatively well and emoothly when being operated at fixed speed, any increase of speed and work leaves the distribution of steam behind its proper timo. Thns, in increasing the speed of the pump, there is an increase of momentum in the reciprocating parts, and consequently, an earlier action of the valves becomes necessary in a really efficient direct acting steam pump. Thus an increase of work and speed demands more port opening for admission and exhaustion of steam; but the action of valves which are moved hy mechanical contact is directly the opposite of this, heing not only later in action but more limited in movement. This naturally results in two losses: contraction of steam opening for admission of steam to the piston, thereby not ohtaining full benefit of the boiler pressure; and secondly, by decreasing the exhaust opening, creating excessive back pressure ahead of the piston, requiring additional hoiler pressure to overcome it. And therefore, steam pump manufacturers recognizing this, to tbem, insurmountable evil, naturally increase the size of the steam cylinder above what is really necessary to do the work, providing the distribution of steam could be positively controlled.

Indicator carde from steam pumps by several of the leading manufacturers shows this to a very marked degree. Another source of loss is the large amount of clearance space which has to be given to steam pumps of this kind by the necessity of making provision for lost motion; the actual stroke of the pump when new being much less in some cases than that called for by catalogue, and there is consequently an excessive expenditure or waste at each change of motion. This prevents any cushioning by exhaust steam and also by live steam successfully under any circumstances without filling immense clearance spaces, and consequently increased cost of fuel. Tc produco the best results in pumping, the column of water should start slowly and the valves in the pump bo allowed to seat and open slowly. This can only be done by a proper motion of the pump piston, which is actuated by the steam piston through a proper distribution of ths steam. This is most clearly shown in the action of the steam pump patented recently through the Mining and Scientific Press Patcut Agency by Mr. George E. Dow, aud mannfactured by ths Hops Iron Works in this city.

In this pump, neither ths piston or rod, or any tappets, arms or cams, come in contact to operato tho auxiliary or main valvc, aud yet the action is positive and always accommodating itself to the varying requiremsuts of the work. The valve movement is never behind, but is increased in velocity and length of travel by increased speed and work; at the same time the increased momentum is compensated for by the arrangement for compressiou and cushion by tho exhaust bringing the pisten gradually at rest, allowing the valves in tho pump to gradnally seat with tho least possible amount of slippage and as gently opening without perceptible concussion. A comparison of the indicator diagrams taken from this steam pump—both steam and water cylinders, with diagrams from other well-known makers, we are informed, showe marked superiority in the action of the valve motion. The clearance is reduced to a minimum in this pump, being less than two per cent., and as no provision has to be made for lost motion, the piston has the same stroke when new as when old.



DOW'S IMPROVED STEAM PUMP.

No live steam is used for cushioning or operating the supplementary piston, so that losses in other pumps are reducod to nothing in this pump through this canse. It is claimed that by the automatic adjustment of port opening no wire drawing on the steam side or back preesure on the exhaust side, exists; consequently, the steam cylinder in this pump is made of less area in proportion to the area of the pump piston than can he made by other huilders for the same duty. The pump valves, air chamber, piston and channel ways have received serious attention, which indicator diagrams provo are smooth, noiseless and economical in action.

These pumps are manufactured of ordinary sizes for general hoiler feeding and of any special sizes for particular work. In presenting these pumps to the public, Mr. W. W. Hanscom, the manufacturer, does not assume or pretend that one kind of pump will perform every kind of work with the hest economy, but prefers to construct the pumps for particular service after knowing the duty required and conditione under which it is to operate. In euch cases he guarantees good satisfaction.

The Sutro Tnnnel sub-drain will contain two separate compartments each 18 hy 24 inches in the clear. It will he ahout four miles in length, and will require an immense quentity of lumber, the material used being three-inch plank.

Grizzly bears are making things lively for cattle on the Liebre rancho, Los Angeles county.

Lincoln's Patent Axle.

We present herewith engravings which represent an improved axle recently patented, through the Mining and Scientific Press Patent Agency, by Edgar E. Lincoln, of San Joso, Santa Clara county. By the construction shown, the axles aud axle boxes may bo united and the size of tho journals hs reduced to very small proportions. It is rendered perfectly dustproof and easy to lubricate, aud the space which the box occupies within the huh is reduced so that the mortises for the spoke tenons may bs sxtcnded near tho center, thersby greatly strengthening the important points, while any oil or lubricant is prevented from finding its way from tho journal to the interior of the hub to loosen tho spokes.

Fig. 1 is a longitudinal section of the box, showing the manuor in which it is fittsd into a hub, and also ths journal. Fig. 2 is a view of thc axls and socket.

A is thc axle, which may be mads in any of the desired forms. It is here shown as squars, with au enlarged hsad, *B*, upon it. A hole, *C*, is hored centrally into the end of tho axle, and the spindlc or journal, *D*, is fitted to turn within this nole or hox, which is formed on the axle. In order to retain it in place, a groove, *E*, is turned around the axle, and the point of a screw or pin, *F*, enters the groovs, or in soms similar manner proveuts the spindls from being drawn.

A cylindrical box, *G*, formed upon the spindle, is exactly fitted to the enlargement, *B*, which it sncloses, when the spindle is in placs within the axle, and it will hs seen that ths principal portion of the strain, caused by the side motion of the wheel, will be transferred directly from the box to the axle through the enlarged head, *B*, and will prevent breakages at that point where axles usually give out.

The spindle, *D*, may be made very small, serving, as it does, only as a guide and to hold the box to its place upon the part *B*. The box, *G*, enters the hub but a short distance, having a sufficient space between it and the outer end of the hub to allow the mortises for the spokee to extend towards the center much further than when the usual axle box is employed, extending entirely through the huh, and this materially strengthens the spoke tenons.

A slender extensiou, *H*, from the end of the hox may pass to the outer end of the hub, and a nut upon its outer end holds the box in place and prevents its coming out.

By this construction, the inventor is enabled to make a strong, solid connectiou between the wheel and axle. The peint at which the strain comes most heavily is enlarged, and there ie less liahility to breakage, whilo the spindle itself is very slender, and will consequently run with less friction. As the hox enters the hub but a short distance, it does not occupy the spacc neeclcd for the spokes, and at the same time the wheel will be very steady in its movements.

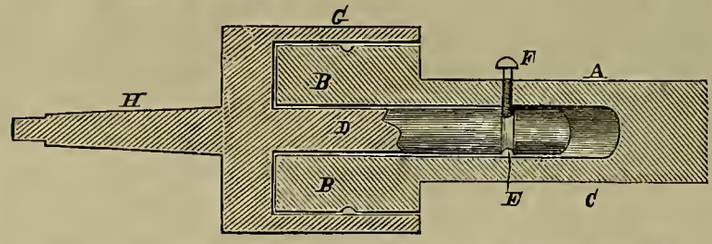


FIG. 1. LONGITUDINAL SECTION OF LINCOLN'S IMPROVED AXLE.

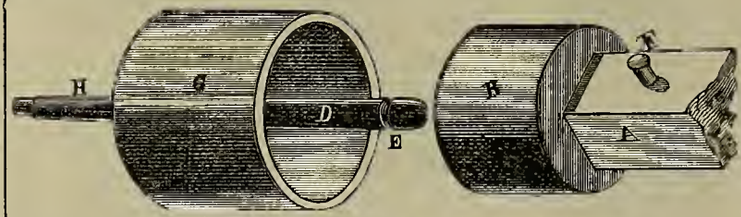

FIG. 2. VIEW OF AXLE AND SOCKET.

Quartz Mining near Home.

While tbis branch of business is making satisfactory headway throughout all parts of our mining domain, it appears to be advancing in certain localities with especial rapidity. Foremost among these stands the Bodie district, where extreme activity seems combined with a look of permanence not often seen in even the most hrisk aud long-lived camps. Bodie stands no longer in the category of experiments. Its success is pretty well assured. Through this district strikes a tier of gold-hearing lodes, some of which have now been extensively worked for over two years, and yielded at a satisfactory rate. Others are in course of development, some having been advanced very nearly to a productive state. In the course of a few months there will probably be twice as many mines turning out hullion as there are at present; and as the principal ore hodies appear to hold their proportions well in depth, and more mills are in course of crection, the shipments of gold from this district ought to aggregate two millions within another year.

And the important mineral discoveries of Mono county are not being confined to Bodie. In the Snake aud Indian districts, further south, a great number of valuable ore deposits have lately heen found. Some of those in Snake, helonging to the Mammoth company, are of extraordinary dimensions, and carrying a great quantity of ore of high grade, for the reduction of wbich this company have put up a mill of large capacity. In the Esmeralda district such encouraging prospects are being met with as promise to restore life to that ahandoned locality, and briug to it, if not such a rush of population, a more permanent prosperity than it has ever yet enjoyed. Over at the Dunderberg mine, northwest of Bodie, another old camp is likely to be resuscitated, this being unquestionably a property of great magnitude and merit, only requiring a trifling expenditure to start it off on a long aud prosperous career.

In the counties along the main gold helt west of the Sierra, quartz mining is also looking up, engaging more attention aud making hetter returns than ever before. In Tuolumne and Amador a very noticeahle onward movement has lately taken place in this industry, and even in the extreme northern part of the State it is getting a foothold from which it will not be likely to slip in the future.

CAUTION

To Hydraulic Miners.

The public generally and Hydraulic Miners especially are hereby notified that any parties making or using the contrivance known as the HOSKIN DEFLECTOR will be prosecuted to the full extent of the law, said machine having been declared by the U. S. Circuit Court an infringement upon my patent, the

Bloomfield Deflecting Nozzle.

The public are also cautioned against using the Hoskin Deflector because of its danger to life and limb, this device having already occasioned several deaths and other serious accidents. The BLOOMFIELD DEFLECTOR is entirely safe, its two and a half years use without accident, as well as its construction, proves it to be a reliable contrivance.

Any parties wishing to purchase the right to use these Deflectors can do so by applying to the undersigned,

HENRY C. PERKINS,

North Bloomfield, Nevada Co., Cal., October 1st, 1878.

SAVE YOUR GOLD!

Highly Important to Miners and Quartz Mill Men!

SILVER PLATED AMALGAMATING PLATES.

The best process yet discovered for saving fine or float gold. Extensively used with great success in gravel and placer mining in various parts of the Pacific Coast. Over five hundred orders have been filled, and the demand is constantly increasing. A large number of these Plates were sent to Snake River mines, Idaho, last year, and a great many orders are being filled for them this season. Circulars containing full instructions for working these Plates sent with each order. Old Mining Plates bought or taken in exchange for new Silver Plated Plates, and full value allowed. Gold extracted from old Plates at a moderate cost by a new and economical process. Old Plates (which often contain a surplus of gold above the cost of plating) can be re-plated.

With the most extensive facilities on the Pacific Coast, orders can be filled very promptly and satisfaction guaranteed.

Mining Men and the public generally are cautioned against unprincipled and irresponsible parties traveling through the country, endeavoring to secure orders for very inferior qualities of Silver Plated Mining Plates.

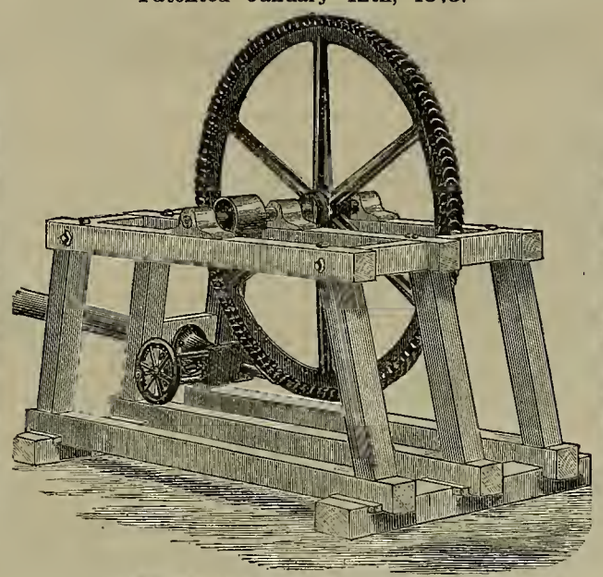
EDWARD G. DENNISTON, - - - - - - - - PROPRIETOR.

Knight's Water Wheel,

Patented January 12th, 1875.

This Wheel possesses more power for a given percentage of Water than any yet offered to the public. They are in practical use in many Mills and Hoisting Works, and never fail to give entire satisfaction, which facts speak fully for their efficiency, and render further comment unnecessary.



This Wheel possesses more power for a given percentage of Water than any yet offered to the public. They are in practical use in many Mills and Hoisting Works, and never fail to give entire satisfaction, which facts speak fully for their efficiency, and render further comment unnecessary.

The KNIGHT WHEEL is used in the following named Mills and Hoisting Works, to which the Public are referred:

1-Eight-foot wheel, running Oneida Co.'s Mill, Amador county, Cal.; 60 stamps. Rob't Robinson, Supt.
1-Eight-foot wheel, running Con. Amador Mining Co.'s Mill, Amador county, Cal.; 40 stamps and two Hepburn pans. David Davis, Supt.
1-Eight-foot wheel, running Lincoln Gold Mining Co.'s Mill, Amador County, Cal.; 40 stamps.
1-Eight-foot wheel running pump at same company's mine. S. D. R. Stewart, Supt.
1-Eight-foot wheel, running Keystone Con. Mining Co.'s Mill, Amador county, Cal.; 40 stamps.
2-Four and one-half foot wheels, used in hoisting by reversible water power at same company's mine. O. C. Hewitt, Supt.
1-Four and one-half foot wheel, running Original Co.'s Mill, Amador County, Cal.; 40 stamps, one pan, one rock-breaker. J. R. Johns, Supt.
1-Four-foot wheel, running Gover Mining Co.'s new mill, Amador county, Cal.; 20 stamps.
1-Eight-foot wheel, running same company's old mill; 10 stamps. John Palmer, Supt.
1-Six-foot wheel, running Talisman Mining Co.'s Mill, Amador county, Cal.; 10 stamps.
1-Eight-foot wheel, hoisting and driving pump at same company's mine. John Tregloan, Supt.
1-Four and one-half foot wheel, running Bunker Hill Mining Co.'s Mill, Amador county, Cal.; 10 stamps. John Palmer, Supt.
1-Six-foot wheel, running St. Patrick's Mill, Newcastle, Placer county, Cal.; 15 stamps. Jno. Townsend, Supt.
1-Eight foot wheel, hoisting and running pump, compressor and hoisting at Sheba Silver Mining Co.'s mine, State of Nevada.
1-Four and one-half foot wheel, running Luck Q. M. Co.'s Mill; 10 stamps; Oregon.
1-Four and one-half foot wheel, running Republic Mill, Nevada county, Cal.; 20 stamps. E. H. Dyer, Supt.
1-Six-foot water wheel runuing at the Plumas Eureka Mill, Cal., 48 stamps, 2 pans, 7 ore-breakers and 22 concentrators.
1-Eight-foot water wheel running 40 stamps for the same Company. Wm. Johns, Sup't.
4-Six-foot water wheels running the Sierra Buttes Mills, Sierra Co., Cal. Wm. Johns, Sup't.
2-Six-foot and 2 four and one-half-foot wheels running Soulsby G. M. Co.'s Mills, hoisting and pumping works, Sonora, Tuolumne County, Cal. J. Leechman, Sup't.
1-Six-foot water wheel running Providence 20-stamp mill, Nevada City, Cal.
1-Four and one-half-foot wheel running DeFrees Mill, Tuscarora District, Nevada.
1-Six-foot water wheel running 20 stamps at Julian mine, Newcastle, Placer Co., Cal. A. H. Schnabel, Prop'r.
1-Six-foot water wheel ruuning Mammoth Mill, 30 stamps and 14 pans and ore-breakers, Mammoth Lake District, Mono Co., Cal. Clark, Sup't.

Ingersoll Rock Drills.

In use in the largest and best Mines of the Coast.

HAS AUTOMATIC FEED.

Has less Repairs.

Is Lighter and more Easily Adjusted than any other Drill.

Our DRY AIR COMPRESSORS are the most Economical Compressors in the Market.

MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.

The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

SAN LORENZO, December 6th, 1877.

MESSRS. DEWEY & CO.—*Gentlemen:* I received the Letters Patent for my invention on the 6th inst., and beg to thank you for the gentlemanly and business-like manner in which you have dealt with me from the beginning of my application. I shall always feel it a pleasure to recommend you to all I come in contact with who need Letters Patent. Respectfully, WM. DALE.

Continued from page 285.

18 ft. On same level running from shaft have made but 10 ft, the vein matter is getting softer.

HIGHBRIDGE.—Have connected the north and south drifts on sixth level. This level connects with drift in Belmont mine 196 ft south of shaft. Had advanced seventh level 17 ft north when water came in in such quantities that it was thought advisable to discontinue work until arrangements could be made for hoisting it. They had commenced a crosscut in sixth level, finding some very rich ore, and when suspended the indications were very favorable for finding a large body before the hanging wall was reached. Before commencing work in these levels it will be necessary to sink a sump, which will enable them to raise enough water for the boilers, saving the expense of hauling it, as previously done. The next work on these levels will be to finish crosscutting on the sixth and crosscut to and across the seventh level north of shaft. The mill is running as well as usual.

EUREKA DISTRICT.

THE HAMBURG.—*Sentinel* April 26: West crosscut on 600 level has been extended 18 ft, the face being in broken limestone, with seams of iron through it. East crosscut from south drift, on 600 level, is now in 22 ft, almost the entire face being in iron, with seams of good ore mixed through it. The stopes above the intermediate drift are looking very well, and are yielding a considerable amount of first-class ore.

THE FOURTH OF JULY.—Work was resumed on the 14th inst. The stopes above the tunnel level are looking very well, and yielding a considerable amount of first-class ore. On the north side of the old inclined winze they have found a vein of gray carbonate ore, about two ft wide, that is of good quality. They have somewhere near 25 tons of ore, already sacked, on the dump ready for shipment to the furnace, a considerable quantity in the mine, already broken, and will commence shipping ore to the furnace at an early day.

EUREKA CON.—There is no particular change to note in regard to the mine. The ore bodies are holding out well, with very fair prospects in the lower levels for developments that will keep the mine on a paying basis for some time to come. The following work has been done in the several levels: Fourth level—North crosscut from main drift continued 22 ft, and is now in 75 ft. Fifth level—East drift from cave continued 10 ft, and is now in 416 ft; started lateral drift running east and made 18 ft. Thirteenth level—West drift from station continued 30 ft, and is now in 300 ft; started drift running west from crosscut No. 1, and made 10 ft.

GOOD HOPE DISTRICT.

MINING NOTES.—*Silver State*, April 19: Important developments have recently been made in the mines of Good Hope district. In the Silver Brick, at a depth of 65 ft, the ledge has widened out and carries considerable ruby, black sulphurets and native silver. The Buckeye, at a depth of 25 ft, is three and a half ft thick, and 14 inches of it is rich in black sulphurets and wire silver. The Aurora, the oldest claim in the district, has been sold to San Francisco capitalists for $30,000.

PARADISE DISTRICT.

SPRING CITY NOTES.—The working force on the Paradise mine has been reduced. The reasons are the accumulation of ore on the dumps and lack of milling facilities. This company have over 1,500 tons of good milling ore on its dumps, not rich enough to ship without assorting, but good paying ore for a mill of its own. There are four tunnels, within a distance of 1,000 ft, in on the ledge from 50 to 170 ft, in all of which, the top, bottom and face is in good ore. In fact there seems to be no end to the ore now in sight, and a piece cannot be broken off anywhere that does not show more or less mineral. Two mills, one of 10 and the other of 20-stamp capacity are to be erected in the canyon this summer. The Bullion is an immense mine—12 to 15 ft wide. A force of eight miners are working it and taking out great quantities of very rich ore, which, for lack of milling facilities, must be piled on the dump. The Big Prize and Rough & Ready are each working a small force of miners, and while piling up some good ore, are developing excellent mines. Work is suspended for the present on the Mount Rose and North Mammoth, pending the arrival of a new superintendent, who is expected daily.

REESE RIVER DISTRICT.

WESTERN NYE.—Grantsville *Sun*, April 26: The Illinois mine has been opened up to a depth of 450 ft. At a depth on the vein of 100 ft a tunnel has been run in several hundred ft, and from this tunnel level, winzes have been struck at different points. The ore vein is from two to eight ft in width. The ore is principally carbonate of lead and carries a large percentage of silver. There is a 10-ton furnace at Lodi. The property of this company worked successfully until the company got into its financial troubles and was obliged to shut down.

AT THE TYBO.—About 30 men have been discharged from the furnaces; caused by the shutting down of furnace No. 1. Should No. 1 again resume work, the same number of men will be put on as soon as she does. The mine and one furnace are still running as usual. The men were paid on the first of the month, which put considerable coin in circulation. Little confidence, however, is expressed in the permanence of the present arrangement and a great many are leaving Tybo.

ARIZONA.

GLOBE DISTRICT NEWS.—*Silver Belt*, April 11: The proprietors of the Golden Eagle are going ahead with the development on their claim. They are now arastraring several tons as an experiment, and if satisfactory results are obtained, will have several more worked at the Haskin mill, provided arrangements can be made to run it through, it being gold ore. Mr. Thomas Newland left yesterday for the Pioneer mine, 16 miles south of Globe, accompanied by Frank Barbell and Epply Bros., to begin work on the Pioneer South. They propose to commence a tunnel at the bottom of the gulch intersecting the ledge and run in 300 ft. At that distance they will have attained a depth of 150 ft, which will give them stoping ground to take out several hundred tons of ore. In event of the mine proving to be what they anticipate, they will then arrange to have a mill erected in that vicinity, and will put up hoisting and pumping works.

MOHAVE COUNTY.—Cor. *Sentinel*, April 19: The Moss mine is undoubtedly sold. Mr. Hitchins lately passed through here with Mr Randolph, the expert, to examine the mine, though he said the mine was sold whether the expert's report is favorable or not. The Mineral Park mill and Keystone mine have been sold to a company of brokers on Wall street, New York, by Ben Spear, and he has gone there to get the money. The mill is in operation, and turns out a fair quantity of bullion. They charge $50 per ton for working, so the ore has to be rich to pay; this short run has been very successful for the miners, or rather chloriders.

LYNX CREEK.—*Enterprise*, April 26: The placer miners are still taking out considerable gold, but water is becoming very scarce, and unless it rains before long sluicing for the season will cease in this camp. The Thunderbolt mill is running day and night. The company at present have in their employ 27 men at the mine and mill together, and the work is satisfactorily carried on under the supervision of Major Dake. There are quite a large number of men prospecting in Walker district at present.

PATAGONIA.—*Star*, April 24: The recent discoveries made by Hershaw, Fea and others, are developing immensely rich. The ledges are mammoth in size, and 10 ft sunk on them shows solid metal, ranging from 3 to 18 ft in width. The discoverers are working silently, but it is the greatest discovery yet made in the Territory, if at depth they prove only one-fourth of the surface showing. Assays run from $70 up to $2,600 in silver. There are nine locations, and all within one and a half miles of inexhaustible wood and water.

SONORA.—The mines of the Altar gold and silver mining company, in Sonora, are developing fine ores. The level which is being run in the 60-ft shaft has struck a rich body ore assaying over $2,000 per ton.

Silver With the Gold.

[Written for the PRESS by A. B. PAUL.]

In my former article under the above caption, there was an omission of both dollar and per cent. marks—as one set of figures gave the gold and silver in dollars and cents, while the other was in *per cent.*

In order to make the matter more clear, I will not only repeat the figures, but enlarge on them, by giving assays, which I have since found. Thus, assays of *tailings* in dollars and cents:

	Gold.	Silver.
No. 1	$10.64	$3.14
No. 2	5.02	3.03
No. 3	15.55	9.28
No. 4	12.06	4.90
No. 5	4.13	6.77
No. 6	10.04	3 14
No. 7	5.02	3.93
No. 8	13.55	6.28
No. 9	8.79	6.28

You have here as an average, $9.42 in gold and $5.29 in silver. It will thus be seen that although a given amount of gold was saved in the first working, that no silver could have been (excepting that naturally alloyed with the gold) which is but a small per cent. It is certainly safe to say, that the average of all the "gold" ores of California is fully $5 per ton in silver, and every millman must judge for himself whether he had better run this off or seek to save it—to say nothing about the gold run off. What is further evidence of this waste, is the much larger quantity of silver per ton, to be found in the concentrations from our "gold" ores, and which, quite frequently, will run up to $30 and $40 per ton. No one concentrating sulphurets, should allow himself to be ignorant of the silver they contain, or to loose all they may have.

The following will exhibit in *per cent.* the gold and silver of our California ores, as per the deductions made by several of the most celebrated analytical chemists:

Gold. Per Cent.	Fineness.	Silver. Per Cent.	Fineness.	Copper. Per Cent.	Iron. Per Cent.	Silica. Per Cent.	Total.
75.86	758.6	20.67	206.7	0.29	54	2.44	99.73
80.57	805.7	12.33	123.3	0.29	54		100.00
86.87	868.7	12.33	123.3	.85			99.38
88.75	887.5	10.05	105.0			1.40	99.80
89.61	896.1	8.88	088.8				98.49
90.70	907.0	8.88	088.8				99.58
90.33	903.3	9.07	090.7				99.40
90.90	909.0	8.70	087.0		1.10		98.23
90.66	906.6	9.04	094.4		33		99.83
92.70	927.0	7.00	070.0	0.40	20		99.80
92.00	920.0	7.00	070.0		Trace.		100.00
93.53	935.3	6.47	064.7				100.00
96.42	964.2	3.50	035.8				100.00

Now all this must make it clear to our millmen, that they are running to waste too much of the precious metals. It is about time we quit this crushing system, of *crushing rock*, and give more care to saving the metals. Investigate as they do in silver mining, know what value your ore contains per ton *before reducing*, and I am sure the big difference between value and results will make millmen think and seek to save the difference.

THE *Independent* claims for the town of Sutro a population of 1,500. There are at present 600 men at work in the tunnel.

New Incorporations.

The following companies have filed certificates of Incorporation in the County Clerk's office at San Francisco:

HERMIT G. & S. M. Co.—Capital, $3,000,000. Directors—Herman E. Giffin, John Tonkin, F. M. Biber, Frederick Schumacker, Nathaniel T. Messer, John P. Bacon and T. C. Boyd.

UNION EXCHEQUER G. M. Co.—Object: To operate in Nevada. Capital, $5,000,000. Directors—T. W. Smart, John G. Green, Joseph S. Atwill, J. D. Brewer and Rudolph Schroeder.

LEOTA CON. M. Co.—Object: To operate in Inyo county. Capital, $20,000,000. Directors—J. M. Seawell, Candido Gutierrez, W. Ayer, J. H. Tingman, J. H. Johnson, T. R. Hayes and C. J. Wiley.

ROCHE ROCK M. Co.—Object: To operate in Nevada county. Capital, $500,000. Directors—Henry Odgers, W. H. George, Joseph Constance, John Skews and William George.

OVERTON M. Co.—Object: To operate in Bodie district. Capital, $1,000,000. Directors—A. C. Dunn, D. L. Smoot, E. D. Farnsworth, E. K. Wood and Robert Taylor.

NORTH STANDARD G. & S. M. Co.—Object: To operate in Bodie district. Capital, $10,000,000. Directors—J. McMechan, Bernard Lande, A. Burr, H. C. Van Dyck and W. L. Locke.

NORTH BULWER S. & M. Co.—Object: To operate in Bodie district. Capital, $10,000,000. Directors—J. McMechan, Bernard Lande, A. Burr, H. C. Van Dyck and W. L. Locke.

BULWER CON. G. & S. M. Co.—Object: To operate in Bodie district. Capital, $10,000,000. Directors—Daniel Cook, John F. Boyd, Seth Cook, W. Willis, Monroe Thomas, R. N. Graves and W. S. Wood.

FAIR VIEW M. Co.—Object: To operate in Mohave county, Arizona. Capital, $1,200,000. Directors—E. C. Bodley, Michael Wolfe, R. C. Swan, H. H. Collier, R. K. Whiteside, H. W. Wright, O. B. Kimball.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO.'S MINING AND SCIENTIFIC PRESS PATENT AGENCY.]

By Special Dispatch from Washington. D. C.

FOR THE WEEK ENDING APRIL 22D, 1879.

CARRIAGE.—A. Bink, S. F.
FIRE EXTINGUISHER.—W. F. Ferguson, Dixon, Cal.
HARROW.—Silas Harris, S. F.
LOOM.—R. H. H. Hunt, S. F.
SLOP HOPPER.—John G. Ils, S. F.
REGULATOR FOR ELECTRIC LIGHTS.—E. J. Molera and J. C. Cebrian, S. F.
REGULATOR FOR ELECTRIC LIGHTS.—E. J. Molera and J. C. Cebrian, S. F.
CARBON FLOATS FOR ELECTRIC LAMPS.—E. J. Molera and J. C. Cebrian, S. F.
VEHICLE RUNNING GEAR.—Chas. Oester, S. F.
ROCK DRILL.—H. Richman, S. F.
OXIDIZING, ETC., FURNACE.—W. T. Rickard, S. F.
TWISTING AND UNTWISTING FIBER.—A. T. Sherwood, S. F.
PORTABLE DERRICK.—J. Uriell, Collegeville, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

JUMP SEAT CARRIAGE.—Anthony Bink, S. F. Dated April 22d. These improvements are more particularly applicable to jnmp seat buggies, or those in which the seats are moved in such a manner as to form a double or single seated buggy or carriage. Great difficulty has hitherto been met in this class of carriages, because the springs which properly support one seat are not suitably proportioned to support two seats when they are opened out by any means employed; and the first part of this invention consists in a novel construction whereby the whole body is proportionately lengthened out as the seats are separated, and the seats themselves are placed so as to distribute the weight upon the springs. The inventiou also relates to a novel construction for a single and extension top, which is fitted to be used on either class of buggy, and in a means for usiug it with a single buggy or of packing away the rear portion. The device is very simplo and compact, and the chango from single to double, or *vice versa*, is made very quickly. The carriages are now being made by M. Kitzmuller, 850 Howard street.

FARM GATE.—E. L. Rugg, Capay, Yolo Co. Dated April 22d. This invention relates to that class of gates which are opened and closed by the driver or rider without the necessity of getting down from the wagon or horse, and the improvements consist in fitting between uprights a gate which may be slid up and down in grooves, the gate being balanced by weights. A peculiarly shaped hook or catch serves to bold the gate in an elevated position after it is raised by a cord hauging from the frame, and this hook is so constructed that the opposite cord when pulled upon will release said hook and allow the gate to descend. The ropes are so arranged that either will act as an opening or disengaging cord, according to the direction in which the team passes through.

METALLIC HARROW.—Silas Harris, S. F. Dated April 22d. The improvements consist in riveting on each side of the holes through the flat bars composing the harrow frame, a peculiarly formed right angled piece of spring steel, the two pieces forming a clamp for the harrow tooth. The upper edges of these clamps are nearer together than the lower, so that as they are driven apart by the insertion of the tooth, they grip the tootb firmly and hold it in place. The inner faces of the clamps are roughened so as to hold the tooth more firmly.

PORTABLE DERRICK.—J. Uriell, Collegeville, San Joaquin Co. Dated April 22d. This patent covers certain improvements in that class of field derricks such as are used in the field for threshing and stacking purposes, and it is expressly intended to render the derrick portable, to save time in setting and taking down, so that in moving from one point of operation to another the time required in setting the ordinary derrick is saved.

THE SOUTHERN PACIFIC.—The Yuma *Sentinel* believes, from certain indications, that the Southern Pacific Railroad Company will not cease their labors for the summer when the track is laid to Maricopa. It says though ties enough to complete the road to that point are already on hand, train loads of ties pass daily, and the same is true of the rails. Then a contract has been let to extend the road to New Mexico; and finally strong temptation to extend the road is offered by the facility with which the next hundred miles eastward can be constructed, and by the late extraordinary mining developments in southern and eastern Arizona.

SAN FRANCISCO has sent $5,000 in cash and provisions to Eureka, Nev.

News in Brief.

Texas suffers from floods.

THE President has vetoed the Army bill.

PORTIONS of Russia are suffering from floods.

DISASTROUS drouths have occured in Cuba.

THERE are five men in Bodie for every job.

TWO Leadville mines have just been sold for $270,000.

OREGON is troubled over the text-book question.

THE Russian army is to be increased by 150 battalions.

IMMIGRATION is rapidly flowing into southern Oregon.

THE Astoria (Oregon) canneries are busy putting up fish.

A HURRICANE has done great damage to the Friendly Islands.

JOSEPH COOK is to deliver a series of lectures in California.

THE political situation in British Columbia is reported alarming.

THE United States troops killed eight Sioux in a recent brush.

THE miners entombed at Sugar Notch, Pa., have been rescued.

THERE is a growing demand from Germany for coarse American paper.

EDISON claims to have fully solved the problem of electric light division.

THE British Pacific coast squadron has been ordered to cruise off Peru.

SIXTY Russian emigrants have arrived at New York en route for Dakota.

AT Vidalia, La., 3,000 negroes are on the river bank, awaiting transportation.

WITHIN the past four weeks 5,000 colored refugees have arrived at St. Louis.

AN attempt was lately made in Chicago to assassinate Edwin Booth the actor.

THE House has passed the Legislative, Executive and Judicial appropriation bill.

MANY wheat and barley fields near Healdsburg are showing symptoms of cheat.

THE Railroad company are planting encalyptus trees along the Humboldt valley.

SEVERAL Chinamen were recently poisoned near Monterey by eating toadstools.

THE high prices of provisions are causing disturbance in Malaga and Grenada, Spain.

IQUIQUE, Peru, is still bombarded and business in the interior is entirely disorganized.

THE Central Pacific contemplate moving their shops from Wadsworth to Reno, Nev.

THE steamer *Great Republic* was wrecked through an error of judgment by the pilot.

THE wreck of the *Great Republic* has been sold for $1,230, and the cargo for $2,500.

REPORTS from Ontario announce great sufferage among the Indians in the Northwest.

TURKEY has promised Servia to send troops to check the incursions of the Albanians.

THE revenue steamer *Rush* has been ordered on a five months' cruise in the waters of Alaska.

THE latest fashion absurdity is the "Boccachio" stockings—one leg white and one pink.

DURING February 14 vessels of a totol of 18,200 tons were launched on the Clyde, Scotland.

AN association has been organized in New York to assist worthy families to homes in the West.

THERE are 4,000 women postmasters in the United States, and the number is on the increase.

TRAINS leaving Ogden for the North are filled with prospectors and others bound for the Idaho mines.

DURING the past year the Fish Commissioners have distributed 140,000 fish in the waters of the coast.

Bullion Shipments.

Since our last issue, we have noticed the following bullion shipments:

Independence, April 28th, $6,000; Grand Prize, April 28th, $9,000; Ophir, April 24th, $19,677.14; Con. Virginia, April 26th, $20,543.26. California, April 26th, $41,920.86; Martin White, April 20th, $8,211; Alexander, April 26th; $6,731.62; Northern Belle, April 23d, $3,895.43.

AN ENGINEER, favorably known in the East, desirous of settling in California, seeks position as Superintendent or Chief Draughtsman. Competent to design stationary, marine, locomotive, mill work, sugar and hydraulic machinery. Speaks Spanish. Unexceptional references. Address EXPERT, this office.

HOW TO STOP THIS PAPER.—It is not a herculean task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter*.

EXAMINE the accelerative endowment plan, as originated by the Mutual Benefit Life Insurance Co., of Newark, New Jersey. Assets, $30,533,429.94. Lewis C. Grover, President; L. Spencer Coble, Vice-President; Benjamin C. Miller, Treasurer; Edward A. Strong, Secretary; Bloomfield J. Miller, Actuary. Send for circulars to James Munsell, Jr., agent of insured, 224 Sansome St., San Francisco.

FRESH attractions are constantly added to **Woodward's Gardens**, among which is Prof. Gruber's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

EXPERIMENTAL MACHINERY, drawings, patterns, models, all kinds of electrical and telegraphic apparatus to order. See ad. F. W. FULLER, 416 Market St., second floor, S. F.

California and Oregon Land Company.—

Location of principal place of business, San Francisco, California. Location of Works, State of Oregon.

NOTICE.—There is delinquent upon the following described stock, on account of assessment (No. 2) levied on the first day of March, A. D., 1870, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Allen, J O	130	400	$160 00
Pond, F B	129	50	20 00
Woodsum, O P	106	100	40 00
Woodsum, O P	107	100	40 00
Woodsum, O P	108	100	40 00
Woodsum, O P	100	100	40 00

And in accordance with law, and an order of the Board of Directors, made on the first day of March, 1879, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the Company, on Saturday, the tenth day of May, A. O., 1870, at the hour of two o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

R. N. VAN BRUNT, Secretary.

Office, Room 6, No. 318 Pine street, San Francisco.

Cherokee Flat Blue Gravel Company.—

Location of principal place of business, San Francisco, California. Location of Works, Cherokee Flat, Butte County, California.

Notice is hereby given, that at a meeting of the Directors, held on the tenth day of April, A. D., 1879, an assessment (No. 41), of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the company.

Any stock upon which this assessment shall remain unpaid on the twelfth day of May, 1879, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Tuesday, the tenth day of June, A. D., 1879, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

R. N. VAN BRUNT, Secretary.

Office, Room 6, No. 318 Pine street, San Francisco, Cal.

Rocky Point Mining Company.—Location

of principal place of business, San Francisco, California. Location of works, Placer county, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 17th day of April, 1879, an assessment (No. 1) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin to the Secretary, at the office of the Company, No. 314 Bush street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 29th day of May, 1879, will be delinquent, and advertised for sale at auction; and unless payment is made before, will be sold on Monday, the 16th day of June, 1879, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Directors.

T. L. BIBBINS, Secretary.

Office, 314 Bush Street, San Francisco, Cal.

Summit Mining Company.—Location of

Principal place of business, San Francisco, California. Location of works, Mineral Point Mining District, Plumas County, Cal.

NOTICE.—There are delinquent upon the following described stock, on account of assessment (No. 7,) levied on the 4th day of February, A. D., 1870, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Byers, W T	38	700	35 00
Edwards, J E	30	700	35 00
Gautier, Gustave	156	200	10 00
Kellogg, H W	46	1000	50 00
Lehmann, C, Trustee	206	200	10 00
Lehmann, C, Trustee	207	200	10 00
Turner, J W	65	200	10 00
Thompson, R	24	1200	60 00

And in accordance with law, and an order of the Board of Directors, made on the Fourth day of February, A. D., 1879, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, No. 318 Pine street, Room 6, San Francisco, California, on Tuesday, the Eighth day of April, A. D., 1879, at the hour of three o'clock P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

R. N. VAN BRUNT, Sec'y.

Office, Room 6, No. 318 Pine Street, San Francisco, Cal.

POSTPONEMENT.—The sale of delinquent stock of the above named Company is hereby postponed until Tuesday, the Sixth day of May, 1879, at the same hour and place. By order of the Board of Directors.

R. N. VAN BRUNT, Secretary.

Office, Room 6, No. 318 Pine street, San Francisco.

JEWELLER.—E. E. Stacy, Reading, repairs all kinde of watches and jewelry. Refers by permission to the publishers of this paper.

Trall Hygienic, Medical and Surgical Sanitarium.

No. 8 Ellis Street, San Francisco, Cal.

Treatment by a Purely Scientific and Rational Method Without Drugs of any Kind.

THE TREATMENT DEPARTMENT EMBRACES ALL APPROVED REMEDIAL AGENTS, AS OXYGEN INHALATIONS, VACUUM TREATMENT, THERMO-ELECTRIC, TURCO-AMERICAN, ELECTRO-MAGNETIC, GALVANO-CHEMICAL, STEAM, VAPOR, WARM AIR, AND ALL FORMS OF WATER BATHS;

Swedish Movements, The Health Lift, Spirometer or Lung Strengthener, Steam Atomizers, all Electric, Galvanic and Surgical Appliances, Sun Baths and Solar Ray Surgery, new and perfect Truss for the Radical Cure of Hernia, lately discovered Chemical Compound for the speedy, safe, painless and permanent removal of Cancers, Scientific and successful method for the Cure of Piles, etc., etc.

☞Aime to keep Abreast with, if not in advance of the Progressive Age.☜

It has been the mission of this System to mold public sentiment, and this Institution will hope to be no disgrace to the immortal name it has assumed. The time has come when Physicians of this School can afford financially to keep a conscience; in fact it is disastrous financially as well as morally to compromise the truth one jota; hence patients can rest assured that they will be treated by the Physicians after the most approved and scientific methods, out of pure and enlightened selfishness, recognizing the truth and beauty of this great principle:

"The Universe is so ordered and arranged that the real and permanent good of every creature is best subserved in promoting the real and permanent good of every other being."

THE BOARDING DEPARTMENT.

The table will be supplied with the best the excelsior market of the world affords, embracing fruits, grains, vegetables, meats, fish, fowl, eggs, cream, etc. Regular and transient boarders will be accommodated as well as patients. Business and professional men and women who are tired of restaurant fare, may appreciate eating to live a more healthful and enjoyable life. Pure food means pure blood. Pure blood means good health.

"The vegetarian school has demonstrated beyond the possibility of a doubt that farinaceous dishes, sweet milk and fruit, are sufficient to maintain a *hard working* man in perfect health. Such a diet might certainly be substituted by sedentary people for their greasy steaks and ragouts.—*Popular Science Monthly, December, 1878.*

The Roome are pleasant, warm, well ventilated and sunny; convenient to treatment rooms, so as to afford the best advantage of nursing and professional attendance.

GENERAL PRACTICE.

Fevers, and in fact all cases may be treated at home successfully. Paturition confinement cases are taken in the Institution or attended at home in any part of the city or country. Preparatory treatment in these cases is most important.

Testimonials of extraordinary cases and cures can be seen on application. The most desperate cases, and especially those that have been given up as incurable by the old methods, are invited. Puerperal and typhoid fever and diphtheria cases, after all other methods have failed, may be said to be a specialty. ☞Send for the TRALL HEALTH JOURNAL.

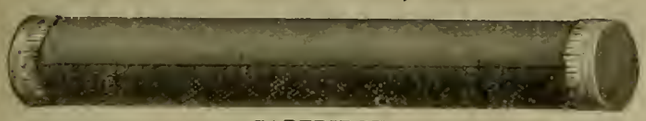
THE SAFETY POWDER COMPANY,

San Francisco, Cal.



CARTRIDGE.

GEN. W. S. ROSECRANS, President.

COL. SAM'L O. GREGORY, Secretary.

Fuse Lighter and Fuse.

Safety Cap and Fuse.

Electric Cap.

Safety Powder, Caps, Electric Caps, and Fuse Lighters.

Under a series of U. S. Patents, after long and carefully conducted experiments and thousands of tests, this Company is prepared to manufacture and supply, for Mining and Engineering Works, the above named articles at prices and on terms as favorable as articles of similar grades are now supplied in this market. Our Powders contain no Nitro-glycerine, no Nitroline, no Gun Cotton, no Fulminates, and are free from the unavoidable dangers in manufacturing transporting, handling and using of all high grade explosives which contain those elements.

Cold does not affect them. They cause no headaches or other inconveniences in handling, and the smoke from their explosion contains no poisoning or sickening vapors.

Their blasting force, with slight tamping, at least equals that of any Powders now used, but they admit and require strong tamping to bring out their immense and peculiar lifting power which follows their detonating work. They should be fired, therefore, by our

Safety Cap,

Which allows tamping without danger. They can be fired by any caps now employed in blasting, but the use of these is always dangerous with any Powder, and the loss of the throwing power resulting from lack of tamping renders it with our Powders doubly objectionable.

Our SAFETY CAPS have twice or thrice the force of triple Giant Caps. When set on fire they do not explode, but merely burn off, and are perfectly safe in transporting and in tamping. In round tin boxes, 50 cents.

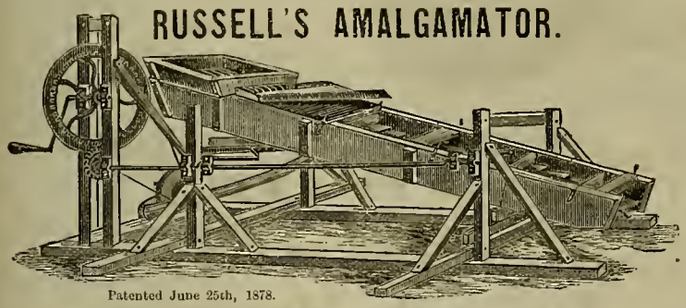
The Safety Fuse Lighter,

Cheap, handy and sure to light the Fuse upon the end of which it is fastened, only needs a trial to be appreciated by every miner who is up to "snuffs." 25 Cents per box; sent by mail.

Safety Fuse,

Equal to the best in the market, will be supplied at the lowest market prices.

RUSSELL'S AMALGAMATOR.



Patented June 25th, 1878.

SAVE YOUR GOLD

And Also SAVE YOUR QUICKSILVER.

The above Washer and Amalgamator with new patent Wire Bridge Quicksilver Boxes attached, can be worked wet or dry, either by hand, steam, horse or water power, and is easily taken apart and packed. For washing Pulp, Earth, Gravel, Mill Tailings or Black Sand, it is without a rival.

Has been Thoroughly Tested and given Complete Satisfaction.

The entire Lining, Hanging Plates, Riffles and Boxes Amalgamated

IS GUARANTEED TO SAVE THE FINEST OR FLOAT GOLD.

Capacity, 30 to 60 tons per day, according to size. For further particulars apply to

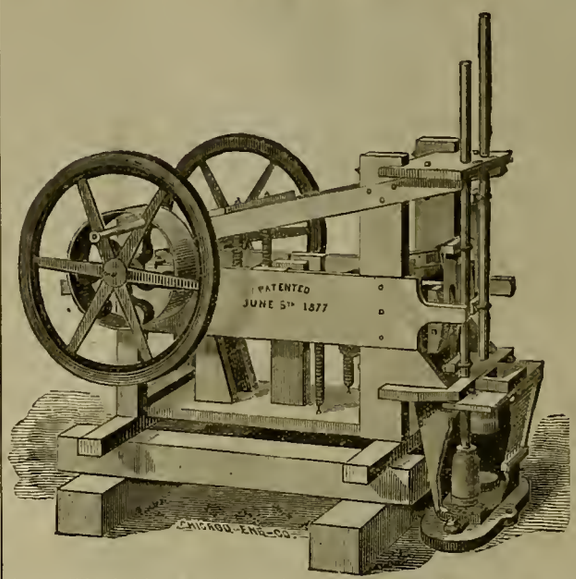
THE POOR MAN'S PROSPECTING

HAND OR POWER QUARTZ STAMP MILL.



Two men can operate it all day. It is simple, efficient and durable. The force of the blow can be changed so as to strike a light or a very heavy blow readily. Two men can work this Mill to its full capacity, and do the work as well as can be done with any of the old-style heavy Stamp Mills. An inspection of this Machine will convince any practical person that it is the most perfect QUARTZ STAMP MILL ever produced in this or any other country. A large number of old practical Miners have seen it, and they all say it is a perfect Hand Stamp Mill. We put on a band pulley, so it can be run with power. The cut is a correct representation of C. EATON'S Patent LATELY PERFECTED MILL.

— FOR —

PROSPECTING

IT IS SIMPLY

Perfection!

When power is used, each Stamp will strike 150 blows per minute. The force of the blow in comparison to the face of the stamp (4½ inches) is greater than that of any of the heavy power Stamps. Stamps and Dies cast on chill. These Machines are well and thoroughly made, nothing about them to get out of order. They are put together with bolts. Can be taken apart readily, so as to be convenient to pack on a mule's back. The whole machine weighs about 1,300 pounds. The heaviest piece weighs 200 lbs. These Mills will do more work (according to money invested) than any of the old heavy Stamp Mills. Net Cash Price, $150.

HORSE-POWER

For Driving Poor Man's Prospecting Quartz Stamp Mill.

This engraving shows the Taylor Horse-Power usually sold to go with the Quartz Mill named above. This power is cheap, simple and effective. The size most suitable, taking the price into consideration, is the heavy one-horse power, cash price, $50. These Powers are sold by me to go with my Mill.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

—o—

No. 1 (XX) is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

PATENTED IN THE UNITED STATES PATENT OFFICE.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

VULCAN BLASTING POWDER.

The Strongest, Safest, Most Uniform and Reliable "HIGH EXPLOSIVE" Manufactured on the Coast.

MINERS TESTIFY THAT IT IS FREE FROM OBJECTIONABLE FUMES.

We call the attention of all desiring such a Powder to our various grades, which we are prepared to sell at LOWEST RATES.

No. 1.—Equalling Liquid Nitro-Glycerine in Strength. We recommend this Grade in extremely hard rock, boulders, iron, etc.

No. 2.—Will do the work thoroughly in all but the hardest kinds of rock.

No. 3.—For bench work, pipe-clay, soft and shelly rock, outside work and quarrying.

Single and Triple Force Ceps, Fuse of all Grades, Vulcan Powder Thawing Boxes, Batteries and Exploders, For Sale at the Lowest Rates.

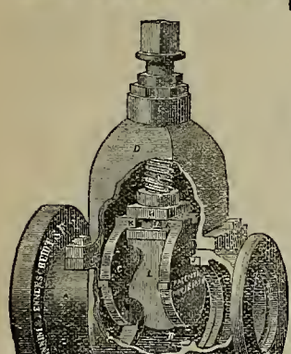
Union Brass Foundry and Mechanical Work Shop.



GIOVANNINI & CO.,

417 and 419 Mission Street, - - SAN FRANCISCO.

The attention of our customers and especially of those interested in Water Works, Gas Works or Mines is respectfully called to our very important improvement in the construction of Stop Valves (or Gates). They differ from all others in that the inner faces are perfectly parallel, therefore when the Gate or Valve is to be opened, at the first movement of the screw the center block (see cut) releases the disks from their bearings, so that they will move easily and prevent the wearing of the inner faces.

This Gate has proved very efficient in Pipes of all sizes, and under any pressure and from its double form and perfect joint formation is especially valuable for use in large Pipes for water, steam and gas, and from its avoidance of any wedge shape cannot jam at any point (see cut).

The **G. & B. Valves** (or Gates) have no equal in simplicity of construction of all working parts, ease of access for repairs, and durability.

We have recently enlarged and fitted up our Brass Foundry and Shop with all the latest improved Tools and Machinery, thus greatly increasing our facilities for rapidly executing orders for all sizes of Stop Valves (or Gates) from three-inch to four feet in diameter, or any size, to order. We guarantee them to give better satisfaction, cost less money, and last longer than any other Valve in use.

We are also prepared to execute all orders in Brass Work for Breweries, Distilleries, Plumbers, Gas and Mining Apparatus, Ship Work, Soda Apparatus, Steam Fittings, Meters, Gauges and Indicators. Also in Machine Pattern and Model Making, and Clock Work. Gear cut to order. Brass Castings of all kinds. We are confident of our ability, and all orders entrusted to us will be executed with promptness and dispatch.

Testimonials as to the perfect working of the Concentrator to be seen at the office.

N. W. SPAULDING'S

PATENT DETACHABLE TOOTH SAWS,

Manufactory. 17 & 19 Fremont St., S. F.

This paper is printed with Ink furnished by Chas. Eneu Johnson & Co., 509 South 10th St., Philadelphia & 59 Gold St., N. Y.

WANTED—$10,000.

For $10,000 cash in hand I will give a one-half interest in the BLUE JAY and ELEPHANT QUARTZ mines, situated in the French Creek Mining District, Siskiyou County, Cal. And I will take or give a lease on said mines, and pay or receive eight per cent. on the amount invested. For further particulars apply to H. C. Coey, Etna Mills, Siskiyou County, California.

C. C. Bitner's Apparatus for Obtaining Metallic Copper from its Solutions.

Patented March 18th, 1879. Will precipitate with steam in three hours, requiring no machinery to run it. Cost of constructing apparatus, $75. The old cylinder process takes four hours to precipitate and costs from $1,200 to $1,500 to construct, besides the machinery to run it. For right to use my Precipitator address C. C. BITNER, Spenceville, Nevada County, California.

FOR SALE.—16-horse Engine 8-inch by 16-inch bore, with 20-horse boiler. Hot water pump. Everything necessary to set it to running. Price, $1,000. At Jackson's Agricultural Machine Works, S. E. corner 6th and Bluxome Sts., San Francisco.

Dewey & Co {202 Sansome St.} **Patent Ag'ts**

CARDNERS'

Celebrated

Governor

These Steam Governors have long been known as THE BEST, and as lately Improved and Perfected, they have no Rival.

THE SAFETY STOP

On these Governors is alone worth double the price of the Governor. We have sold over six hundred, and

Never one has Failed.

They are sold at the same price (or less) as ordinary Governors. Send for Circular.

BERRY & PLACE,

Market, head of Front St., San Francisco

Books for Miners and Millmen.

KUSTEL'S ROASTING OF GOLD AND SILVER ORES, and the extraction of their respective metals without quicksilver. Illustrated. 142 pages. 1870. A valuable and carefully written work. Postpaid, $2.50. Published and sold by Dewey & Co., S. F.

KUSTEL'S CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for gold-bearing sulphurets, arseniurets, and gold and silver ores generally, with 120 lithographic diagrams. 1867. This work is unequaled by any other published embracing the subjects treated. Post-paid, $7.50. Printed and sold by Dewey & Co., S. F.

PHILLIPS' EXPLORERS, MINERS AND METALLURGISTS COMPANION, comprising a practical exposition of the various departments of exploration, mining, engineering, assaying and metallurgy. 682 pages and 83 illustrations. A most valuable and comprehensive book of reference to prospectors and practical miners. Post-paid, $10.50. Published and sold by Dewey & Co., S. F.

AARON'S TESTING AND WORKING SILVER ORES.—Illustrated. 114 pages. 1876. A useful and practical work, free from technicalities and extremely serviceable for miners' use. Post-paid, $2. Published and sold by Dewey & Co., S. F.

COPP'S HANDBOOK OF MINING LAWS.—Containing the U. S. Mining Laws, Digest of Decisions, Forms, etc. 1877. Pocket size and very handy and convenient for miners. Post-paid, $1. Sold by Dewey & Co., S. F.

Knight's Water Wheel.

The large number of these Wheels now in use is the best guarantee that they possess the superiority accorded them. They never fail to give satisfaction. For sale by ALMARIN E. PAUL, Agent, Room 20, Safe Deposit Building, S. F.

VOLUME XXXVIII Number 19.

Terrace Canyons and Cliffs.

In Powell's "Exploration of the Colorado Rivor of the West," occurs tho following description of the Torrace canyons which are cut through three great inclined plateaus: "Conceive of three great geographic terraces, many hundred feet high, and many miles in width, forming a great etairway from the *Toom-pin Wunear Tu-weap*, below, to the the valley of the Uinta, ahove. The lower step of this stairway, the Orange cliffs, is more than 1,200 feet high, and the step itself is two or three score miles in width. The second step, the Book cliffs, is 2,000 or more feet high, and a score of miles in width. The third or upper step, is more than 2,000 feet high. Passing along this step, for two or three score miles, we reach the valley of the Uinta, hut this valley is not 5,000 or 6,000 feet higher than the *Toom-pin Wunear Tu-weap*, for the stairway is tipped hackward.

"Climh the Orange cliffs 1,200 feet high, aud go north to the foot of the Book cliffs, and you have gradually descended so that at the foot of the Book cliffs you are not more than 100 feet above the foot of the Orange cliffs. In like manner the foot of the Brown cliffs is but 200 feet higher than the foot of tho Book cliffs, and the valley of the Uinta is not quite 300 feet higher than the Brown cliffs.

"To go hy land from the valley of the White River to the *Toom-pin Wunear Tu-weap*, you must gradnally, almost imperceptibly climb as you pass to the south, for 40 or 50 miles, until you attain an altitude of 2,500 or 3,000 feet above the starting point. Then you descend from the first terrace, by an abrupt step, to a lower one. Still continuing to the south you gradually climb again, until you attain an altitude of more than 1,000 feet, when you arrive at the brink of another cliff, and descend abruptly to the top of the lowest terrace. Still extending your travele in the same direction, you climb gradually for a third time, until you reach the brink of the third line of cliffs, or the edge of the escarpment of the lower terrace, and here you descend by another sudden step to the plane of the river, the upper terrace through the Canyon of Desolation, the middle terrace through Gray canyon, and the third through Labyrinth canyon.

"The hird's-eye view, shown on this page, is intended to ehow these topographic features. The escarpment below, in the foreground, represents the Orange cliffs, at the foot of Labyrinth canyon; the second escarpment, the Book cliffs, at the foot of Gray canyon; the third, away in the distance, the Brown cliffs, at the foot of the Canyon of Desolation. It will be seen that the three tables incline to the north, and are abruptly terminated by cliffs on the south. For want of epace the whole view is shortened. In the three canyons there are three distinct series of heds, belonging to three distinct geological periods. In the Canyon of Desolation we have tertiary sandstones; in Gray canyon, cretaceous sandstones, shale and limestone; hetween the head of Labyrinth canyon and the foot of Gray canyon, rocks of cretsceous and jurassic age are found, but they are soft, and have not withstood the action of water so as to form a canyon. These formations differ not only in geological age, but also in structure and color."

Mr. Powell has a technical description of these terraces, with their geological peculiarities, somewhat in detail. Deductions are drawn from their formation also hy Prof. Le Conte in his recent work on Geology, published by Appleton & Co., of New York, in either of which works the reader who is interested may find further details.

PARTIES have left Portland, Oregon, for the head of navigation on the Columhia river to commence the preliminary survey for the construction of the Northern Pacific railroad from that point eastward.

THE publishers of the *Revolution Francais*, in Paris have been condemned to three months imprisonment and to pay a fine of 1,000 francs.

CHOLERA is causing great mortality in India.

No Cause for Alarm.

We alluded not long since to the fears entertained hy some of great disasters likely to attend the perihelion passage of the four great planets about to occur. These fears we attempted to show were not only groundless, but absurd, the failure of many similar predictions having been cited in support of this view of the matter. On the snhject of these threatened ills, C. C. Blake, a well-known Americen astronomer, puhlishes a long articlo in an Illinois paper, in which he demonstratcs the influence of theso planets upon our earth to be so infinitely small that we need apprehend no malefic effects therefrom. He even shows the very data upon which these alarming predictions are hased to he grossly and strangely inaccurate.

In the first place, astronomers, in computing the perihelion of Neptune, differ as much as seven years as to the time when that event will occur. In regard to the perihelion of Uranus, these authoritics are not agreed whether it will take place in 1881 or 1882. Saturn will not he in conjunction with the sun until the latter part of 1885, when the era of these dire calamities will he past and over. Jupiter, the largest planet in our system, heing 1,387 times as largc as the earth, will pass its perihelion point in September, 1880. These great orbs in this matter of coincidence will, in fact, not act at all conjointly. Even if they were to do so no great harm would follow. The perihelion of Jupiter, Saturn and Uranus all occurred in 1797, and yet that year was not distinguished for famine, tempests, plagues, or other great disaster. The perihelia of Jupiter and Saturn were again in coincidence in 1850, another year exempt from baleful influences and hloody eveuts. If all the planete in tho solar system were to pass their perihelion at one time and all in the ssme heliocentric longitude, such a conjunction would have no appreciable effect upon the climate or inhahitants of our glohe. Doubtless persons who have been giving way to feare about these planetary movements, may safely dismiss the same.

CO-OPERATIVE COLONY ASSOCIATION.—We notice that a movement has been set on foot in New York city in the organization of a Co-operativo Colony Aid Associatiou, to assist worthy families of workingmen to homes in tho West. An Executive Committee has been chosen, embracing the following: Charles F. Deems, R. Heber Newton, Felix Adler, Joseph Seligman, Courtlandt Palmer, E. V. Smalley, C. F. Wingate, Dr. Rylance, and George Saterlee. The plan is to put the advantages of colonization before the people, to aid such as are willing to go, if possible, and that eventually, if deemed advisahle, the Association should take the form of a joint stock concern.

BIRD'S-EYE VIEW OF TERRACE CANYONS.

TIME!—As the Manhattan mine at Austin, Nev., is now turning out bullion freely, is it not about time the shareholders should be receiving some dividends again? The Manhattan mill produced last week $17,819 from 98 tons of ore.

THE House Committee to inquire into the cause of the present depression of labor in California will leave for California July 15th.

DEPOSITS of tin ore are said to have been found lately along the foothills in Fresno county.

New Form of Stamp-Mill.

Charles S. Stanchfield, of Oakland, has recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency an ore mill of a new form. It consists in forming on a hollow shaft, journaled to one side of tho center of an evoluto or eccentrio case or mortar, a series of hollow guides, properly bushed and lined, in each of which plays loosely a stamp, which strikes a blow as the shaft is rotated. These guides being attached to the shaft at right angles aud the stamps playing loosely in them, the stamps are free to move out of the guides from either end and can strike two blows for each revolution of the shaft.

The mortar heing made of an evolute or eccentric form, after the stamps strike their hlow, they slide up the inclue or cnrve, grinding or pulverizing the ore as they move, nntil they reach suitable ribs which free the stamps from any rock that may have heen carried up in the outward movement. At this point gravity begins to act and the stamp falls the other way and crushes the ore, said operation being repeated. Water is fed to the mortar through the hollow shaft and guides, thereby lubricating the stamp stems and keeping them free from grit.

The dies are made of curved plates which are removahle. As many stamps may be placed in the shaft as practicahle, and they are eet so as to havo a regular interval between the drop. As the stamps slide freely on the guides, when the shaft is rotated at proper speed, said stamps slide or drop consecutively on the ore just as it reaches the dies under the feed opening. This crushes the ore and as the stamps are carried around by the rotation of the shaft, the shoes slide along the dies and further pulverize or grind the ore. The mortar or case being made in an eccentric or evolute form, and the shaft heing journaled at one side of the center, as each stamp slides along on the dies, it gradually curves further out of the guides, centrifugal force keeping it iu close contact with the ore on the dies. Before the time, however, that it reaches a horizontal position, the pressure gradually decreases and the shoe slides off the dies on to a rib. As the stamp slides on to this, any ore which may have accumulated on the shoe will fall hack on to the dies again.

The instant the stamp passes a horizontal position, gravitation will cause it to slide or drop in the other direction and ont of the other end of the guide, giving another blow upon the quartz on the dies. Each stamp therefore strikes two blows for each revolution of the stamp.

The water admitted to the hollow shaft ie ejected through the guides, around the stamp, going first out of one end of the guide and then out of the other, as each end is pointed downwards. This action not only furnishes water to the battery hut also serves to lubricate the stamp stem, and wash off any grit or sand from the stamp. The steel hushing inside the guide, and in which the stsmp slides, is made removable, so as to he changed when worn.

The rotation of the shaft is intended to be rapid enough to carry the stamps almost to a vertical line before they strike their blows, and each blow will therefore he struck at the point where ore drops on the dies. The grinding action of the stamp as it moves over the dies is the same as that of the drag of an arastra, which pulverizes the ore after the first crushing blow, much the same as that of an ordinary stamp.

The shaft is mounted on adjustable journals so as to regulate the amount of drop to the stamps. In case of dry crushing, a blast of air may be forced through the hollow shaft instead of water, and the grit kept out of the bushing by that means.

IT is now hy many believed that it is the intention of Jay Gould to extend the Utah & Northern railroad into Oregon, the objective point heing on the Columhia river, and thue making this road an important feeder of the Union Pacific.

DURING the late outhreak in Panama 35 persons were killed in the streets.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Letter from Tuolumne County.

A Slight Revival of Mining—Old Things Passing Away.

EDITORS PRESS:—After a long and what for a time eeemed a losing fight, quartz mining in Tuolnmne has been brought upon a self-eup porting and in some cases dividend-paying basis. That this etruggle should have been so prolonged and the issue for a time involved iu so much doubt has not been the fault of the mines nor yet wholly of the management. The main causes have laid back of these. From tbe first a large element of our population has consisted of those idle, shiftless sort of people, who will work only under the stimulus of big pay, sucb as cannot now easily be made, or the force of sheer necessity. Our pioneer miners were of a mongrel kind, made up in good part of Mexicans, Texane and Kanakas, with a large sprinkling of gamblers and other mcre adventurers, attrected at first to these diggings, where money being easily made was readily epent. So long as the rich surface placers lasted all went well. But eince they were worked out, or nearly so, things have undergone a change. To make money now requires economy and hard work. But we have many of these thriftless sort of persons with us still. They form a majority of our working population—or rather I should say of the people who ought to work, which they will not; unless, as before stated, they can get "'49" wages or are compelled by hunger. When hard up these make-shifts gouge out a little rich ore from their quartz lodes and pound it up in hand mortars, pan and crevice about in the eummer and practice eluice weshing and ground sluicing in the wiuter when they have cheap or free water, and in this way manage to keep soul and body together.

It has been their practice to take up mines and mining ground and, doing only work enough to hold them, hang on year after year unable to develop and unwilling to sell them at any reasonable price, thereby keeping out live men, discouraging investments and retarding the progress of the country generally. Even those of the earlier settlere who have undertaken to open and outfit their claims have, as a general rule, done so in such a halting, inefficieut sort of way as has failed to bring profit to themselves or help advance the mining intereets of the county. And so old Tuolumne has been, until quite recently, kept uuder a cloud; her mines worked without energy or system; her mills shut down, and the water, that should have been employed in gravel washing, suffered to run to waste.

Within the past year or two this condition of thinge has begun to change, the progress of qnartz mining especially having, for the last few months, been very marked. The old Soulsby mine, with its early brilliant history and subsequent mishaps, is coming to the front again in a way that promises to place it soon in the most forward rank of our productive properties, if it do not eclipse its early fame. The five-etamp mill lately put up on the Keltz mine bas eince heen running with such good results tbat the five additional etamps, for which power hes been provided, are at once to be put in place. On the Harris mine, near Jamestown, a new ten-etamp mill has been put up and is running to satisfaction, the old mill on this property having heen burnt down some yeare ago. The new ten-stamp mill on the Evans mine is also doing first-rate work. The mill on the Mount Jefferson lode, at Garrote, has also lately been started up, with the prospect of entering on a long career of success, as the mine of that company, after having been put in good shape under the new management, is showing up a eplendid body of rich ore. The improved outlook for the Mount Jeffersou has encouraged to a renewal of prospecting on other quartz ledges in that neighborhood; and, as a result, several rich finds are reported. Touching the value of the quartz veins about Garrote there has never heeu any question, but they bave mostly heen owned by parties of limited means, and have therefore never beeu thoroughly explored. This town will now take a new start, and shortly grow into an important quartz miuing center.

Several of our hydraulic mines are now being run with a full head of water, this branch of gold washing being more active than ever before. Some of the old tunnele run in this vicinity under Table mountain yeare ago and afterwards abandoned, are being reopened by parties who have both the will and meaus to thoroughly explore the auriferous channels that are known to run under these basaltic mesas. If they eucceed in getting into and draining these buried rivers, their reward ie certain. More gold will be taken out in Tuolumne thie year than last, and the bullion product of the county will hereafter eteadily increase.

OLD SETTLER.

THE Utah and Northern is to be extended anotber 100 miles by the Union Pacific this year, which will be a total distance of 280 milee, bringing it over the divide 70 miles from Snake river.

Volcanoes of the Pacific Coast.

The forthcoming "Journal for 1877," of the American Geographical Society, will be full of interest for the scientific public. Its first article, hy S. F. Emmons, of the Survey of the Fortieth Parellel, is a grapbic, but modestly told narrative of an achievement of which any mountaineer might be proud, and is full of novel information. Its title is the "Volcanoes of the Pacific Coast;" but the real etory ie of an ascent of Mount Rainier, whose magnificent, snow-covered peak dominates Vancouver, from an altitude of 14,144 feet. The writer of this paragraph has heard Mr. A. D. Wilson, the compauion of Mr. Emmons, in that perilous ascent, recount, by camp-firee in Wyoming, the toils and dangers of the expedition; and recognizes in this vividly-written history the fit presentment of a remarkable enterprise. This adventurous part of the essay we can only refer to.

In relation to tbe volcanoes of the west, Mr. Emmons considers that in the tertiary times the great interior basins, between the Rocky mountains and the Sierra Nevada, must frequently heve heen the scene of terrific volcanic action. In the upper basin of the Columbia and Snake rivers, tens of thousands of square miles were covered by continuous sheets of volcanic rocks, often many feet in thickness. As the massive eruptione of volcanic material gradually ceased, and the gaping fissures in the earth's eurface healed and were covered over, we may imagine along the western coast of that time a line of volcanic vents, like beacon fires, lighting up the rocky headlande, from which issued almost continuous clouds of steam and sulphurous gases, accompanied hy frequent ehowers of rocke and ashes and outflowe of hot lava, which gradually built up, around the orifices, immense mountain messes. At what time these eruptions ceased, we have no means of determining. In the cold, white glacier-scored peaks, the casual observer would scarcely suspect these ancient fiery mountains; yet, even uow, there slumbere within their mass a spark of the ancient fire, which may eome day break forth into conflagration. Through the crest of the Cascade range extends the American segment of that "Ring of Fire," which surrounds the Pacific ocean. The more prominent of the volcanic cones represented here are Lassen's Peak and Mt. Shasta, in northern California; Mt. Pitt, the Three Sisters, Mt. Jefferson and Mt. Hood, iu Oregon; and St. Helena, Adams, Rainier and Baker, in Washington Territory. Along the Sierra Nevada proper, which was lifted above the sea long before tertiary times, volcanic activity has hecn coufined to a few small volcanic vents along its eastern hase, near Mouo lake, and to flows of basaltic lava on its western slopes, which have, in many instances, covered the gold-bearing gravele of the late tertiary timee. In the midst of the lake is a small island, which conteins a crater and abounds in hot springs, while to the south of it extends a line of volcanic craters, forming a low ridge, relatively unimportant by the side ot the towering Sierres, but extremely remarkable as being the only place where the bleck glass, known as obsidian, so much prized by the Indians for making their arrow-heads, is known to occur in considerable quantity. Small fragments may be found in almost any portion of the Rocky mountain region, often hundreds of miles distent. The craters are generally eurrounded by a "cinder-cone," or a circular, rampart-like ridge of loose scoriæ and volcanic ash, within which are piled up irregular masses of black and gray glass and white frothy pumice, the latter so light as to float on water, and often drawn out in silky threads, like spun glass.

To tbe technical geologist, Lassen's Peak is, perhaps, the most interesting of all; it was iu its study that Von Richtofen gathered the moet important facts which led to his classification of tbe relative ages of volcanic rocke. Here are found places of long-continued volcanic activity, remnants of ancicnt cratere formed and destroyed eges ago. To the original andesitic eruptione have succeeded those of trachyte and rhyolite; the latter in the remarkable granitic form known as nevadite, tbe masses of which, in cooling, have shrunk and split up in the most remarkahle manner, resulting in a confused region of riven rock-masses, to which the appropriate name of chaos has been given. The final flowe have heeu of basalt, which rock has covered such immense extents of country to the north and east. Indications of the internal heat etill remaining, at no great depth beneath the surface, are found in its solfataras and hot springs, from which there is a constant escape of sulphurous gases and steam; these are concentrated in the basin of an old crater, christened in the characteristic Californian vernacular, Bummer's Hell. Here, also are found the eo-called "mud volcanoes;" little conical mounds only a few feet in higbt, with a central orifice, from which from time to time are thrown out masees of eoft, wet mud; within them a conetant rumbling, like eubdued thunder, may be heard at all times; and, by plugging up the orifice, an artificial eruption may, after a short interval be produced, and the plug will be thrown out with great force.

Shasta is another old volcano, and northeast of it are immense tracts of country, covered by flowe of basaltic rock. Broad etretchee of table-topped ridges are cut through in every direction by an intricate network of uarrow gorgee and ravines, abounding in natural fortreeses and cavee, and traversed by streams, which frequently disappear for distances of many milee beneath tbe horizontal beds of basalt, to reappear in a most unexpected manner. It was in such "lava-bede," that during the late Modock war, a mere handful of Indiane were able by their intimate knowledge of the intricacies of the region, to hold at hay the whole military force that could be brought against them.

East of Mt. Pitt are numerous lakes, which are probably fed largely from springs iseuing from tbe volcanic rocks. Most interesting among these is Crater lake, which fills an ancient crater about eight miles in diameter. Its walls rise from 500 to 1,500 feet above the level of the lake, and it is difficult to reach the shores without the aid of ropes. The showers of eshes which once issued from this crater can easily he traced by the peculiar character of the soil, for a distauce of about 28 miles east and 10 west of the lake.

In the region of the Columbia river, which presents eome of the grandest and most picturesque scenery of the United States, the volcanic phenomena, both of massive eruptions and of crater cones, attain an enormous development, and can be seen under most favorable circumstances. This river, which dreins an area of nearly 200,000 square miles, has cut its channel, in a cauyon-like gorge, transversely through the Cascade mountains almost down to the level of the sea. By means of the section thus exposed, we are enabled to study the etructure of this mountain range to its very core.

At the Cascades, nearly in the middle of the range, which form the limit of navigation from the ocean, and to which point the work of the Coast Survey has been carried so as to furnish trustworthy meesurements, the basaltic cliffs rise 3,700 feet, nearly perpendicularly, ahove the river. A thickness then of over 3,000 feet of lava has been accumulated from massive eruptions to form the range at this point. At the base of the cliffs is found a conglomerate or pudding-stone—a rock made of rounded pebbles and gravel, which time and pressure have compacted and hardened, and which here indicates a former shore-line that hes been covered by the basalt. Within the couglomerate are found trunks of trees, some changed to stone, some merely carbonized, with leaf remains, which enable us to determine the geological age of the period immediately preceding the building up of the range at this point. This was the miocene tertiary, a time when a tropical climate prevailed over our whole continent, even far up into the Arctic regions.

This bed of conglomerate also gives a clue to the history of a more recent period, to a change in the course of the river and the formation of the Cascades themselves. The Cascades are rather rapids than falls, where the river descends rapidly for a mile or two, in one place foaming and boiling over masses of broken rock. A railroad, six miles in length, conveys passengers from the steamer which comes from Portland to that which runs to the Dalles from the head of the Cascades. Just beyond this railroad may still be distinguished in the forests which cover the bottom of the canyon—here considerably wider than the bed of the river—the traces of an ancient stream-bed, somewhat higher than the present one, but which, at no very distant period, was evidently occupied by the river, being more in its direct course thau the bed it now occupies at the Cascades. Indians tell ue that there was once a natural bridge at the Cascades, by which their ancestors used to crose the river, and this is rendered probable by the existence of flat, table-like masses of basalt on either side, which might have formed the piers to such a bridge. Again, along the ehores of the river above the Cascades, are great numbers of dead tree-trunks, standing in the water and partially submerged even at its lowest stages. Pine trees would not have grown to such size in the water, or even if they had, what should have killed them all eo uniformly? . The explanation seems simple enough when all these facts are combined. At the time when, in the course of cutting this canyon through the mountains, the river had reached nearly ite present level, but was still running in the old stream-bed, its waters found a new outlet by perforating this permeable etratum of conglomerate. The opening thus made grew rapidly larger, owing to the easy disintegration of the conglomerate, until it was large enough to take the whole stream; and thie hed being at a depth much lower than the present, the old stream-bed was abandoned, and along the upper side of the river the trees grew down to its very edge, while the river, for a short distance, had the character of the lost rivers, being concealed beneath the basalt bridge; but in course of time the supports of the bridge were undermined and the whole mass of overhanging basalt fell iuto the etream, damming it up so as to produce the present Cascades, and causing a rise or "backing-up" of the water in the upper part of the stream, so that the trees along the edge, having the soil washed away from their roots by the rieing water, gradually died and decayed, leaving only the etumps we now eee liuing the bordere of the river.

In addition to Mr. Emmone' paper, the volume containe a description of the diamond fields of South Africa, by Wm. J. Morton, M. D.; a discussion of the King of Belgium's plan for the civilization of Central Africa, by means of lines of etations; an exceedingly valuable paper by the Rev. Dr. Selah Merrill, upon his late scientific researches into the archæology of Palestine; long papere upon a journey up the Magdalena river, and across the Andes, describing the discovery of the prehistoric etatue of "Chac-Mool," in Yucatan. There are eeveral minor contributions, and the whole volume richly repays perusal.—*Science News.*

Mining in New Mexico.

A Santa Fe correspondent of the Kansas City *News* thus writes concerning the mines in that Territory:

All the talk in Santa Fe, at present, is the new (in one sense, but old in auother), carbonate discoveries recently made 20 miles below this city by practical miners. Not only there, but all over the Territory, and in some portions of Colorado, the wonderful discoveries are known, and practical miners are coming into the various camps daily. Prior to their expulsion by the Indians in 1680, the Spaniarde, in a primitive way, worked these mines. Practical miners say that they have prospected sufficiently to know that the mineral belt extends at least six miles north and south, and five miles east and west, and that the true fissures point northeast and southwest. Dozens of new veins have been opened very cheap, and one and all show excellent mineral—thus far not a barren vein has been found. All the veins widen in depth.

The followiug is a brief statement of the condition of several of the first discovered mines: Mina del Tiro, width, 15 inches; depth, 160 feet; width at base, 7 feet. Carbonate, asseyed at 4 feet, 92:4-10 ounces; 8 feet, 120 ounces, width, 11 inches; No. 1, 63% lead; 21 ounces silver; No. 2, 51% lead, 34 ounces silver; No. 10, 50% lead, 8 ounces silver; No. 11, 44 ouncee eilver; No. 12, 72 ounces eilver; No. 13, 50% lead, 33.7 silver; No. 14, 135 onnces silver, 1⅞ ounces gold; No. 15, 50% lead, 10 ounces silver. This may not be properly considered a high grade of ore, but many miners of great experience coutend that it will pay a big per cent. for working. The average wealth of the ore is far from being fully developed. Not a shaft has been eunk over 20 feet, but they are going deeper rapidly. Withiu four miles, plenty of water for all mining purposes is to be fouud in large quantities. Reduction works will soon find their way into the camps, and no ore will have to be hauled over four miles. Alreedy very excellent roads are to be found leading to and from the various shafts. At no great distance southward, very excellent anthracite coal has been discovered in great quantities, also the best of fire clay, fuel of all kinds, it ie claimed, is remarkably cheap. Men who have delved in other mines for years are in these mines and well pleased, and say their friends are on the road by dozens; there is no braggadocio about them; evidently they mean business.

A few hours' walk through the carbonate country reveals the fact that the claims are being taken up rapidly; each stake shows a recent date, and the marks of the pick and shovel could be seen on every hand. The leads are well defined, and a boy, with but little explaining, could locate a claim just about as easy as an experienced miner, provided he did not infringe on the rights of another. There are at least 200 meu located in the different portions of this mining camp that have come to stay.

ELECTRIC LIGHT IN HYDRAULIC MINING.—The first electric light ever introduced in a mining claim was placed on the Deer Creek placer claim of the Excelsior Water Company at Smartsville, on the 10th of last month. A 12,000 candle power Brush machine was put in operation, and three lights of 3,000 candle power each were placed in prominent positions upon the claim. Although the night was very dark the lights shed a brilliant light around end enabled the miners to work as readily as during the day. Until this experiment the mines had to shut down during the night, but now the company expects to work hoth night and dey. Nevada and Yuba counties have many hydraulic mining companies, and several of them have announced their desire to use the new light if the Excelsior company is thoroughly satisfied with their machine. As Mr. Law has received several telegrams from the company which state that it is working well, there can be no doubt that it will be adopted. The three lights cost the company abont 10 cts. per hour, and with interest, wear and tear, etc., included, the claim ie lighted for 16 cts. per hour. The company's daily clean-up ie from $500 to $1,000, and by running uights also, the yield of the mine can be doubled.—*Nevada Transcript.*

THE RICHMOND FURNACE:—A good deal of flux is being taken out of the Belmont mine aud will shortly be shipped to the Richmond furnaces. The liberal terms offered by that company for low grade ores have been of great advantage to small mine owners generally—in fact to the owners of some of our larger mines as well. The shipmente of low-grade quartz kept the Connolly working eo long. Had it not been for them it would have been shut down long before. At the ordinary rates paid hy the furnace companies ore cannot be eold to any profit unless it coutaiu at least $75 per ton. By the arrrangements at the Richmond, siliceoue ores of $30 value can he handled to advantage, and even ore of from $15 to $20 will pay for its extraction; thus enahling mine owners of little means to coutinue in the development of their properties. The Richmond furnaces have at length attained their maximum emelting capacity of 80 tone daily. They are probably the largest lead emelting furnaces in the world, and the emelting as carried on in them a thing *sui generis.*—*Eureka Leader.*

MECHANICAL PROGRESS.

Suggestions for Safe and Economic Generation of Steam.

The report of Mr. Henry Hiller, the chief engineer of the National Boiler Insurance Company, Manchester, England, upon the technical work done during 1878, has just been issued, and contains a large amount of valuable information and useful suggestions. With regard to the advisability of compounding existing condensing engines, Mr. Hiller suggests that where these are overloaded, and the boilers in connection will permit of a suitable increase of pressure, great saving may be effected; but in many instances the better course would be to put down new engines and boilers suitable for the work required. The compound system is preferred on account of the avoidance of the great initial strain which is unavoidable with the single cylinder engine working with a high grade of expansion, as the load can be more uniformly distributed throughout the stroke; whilst with few exceptions the consumption of steam in compound engines is comparatively below that in the single cylinder engines. The proportions of cylinders in compound engines vary very considerably. Where it is desired to equalize the load, and the pressure in the boilers is (say) 80 pounds per square inch, a proportion of capacity of one to four has been found to give good results in engines fitted with ordinary slide valves worked by eccentrics. If the low-pressure cylinder is proportionately less the steam must be cut off at an earlier point in the high-pressure cylinder, but this will depend on the load to be driven, the pressure in the boilers, etc. Hence it is necessary that in all cases the proportions should be arranged to suit the respective circumstances and requirements.

Most careful calculation should be made where it is proposed to convert existing single engines into compound ones, as much disappointment has resulted by the adoption of cylinders of unsuitable proportions. In some cases after great outlay the results obtained were inferior to those secured before the alterations. Some parties advocate the use of a small high-pressure cylinder, the capacity of the low-pressure one being in the proportion (say) of eight to one, the steam being carried the whole length of the stroke in the high-pressure cylinder. This involves the low-pressure cylinder being of large size, and I believe considerably increases the comparative loss arising from the cooling effect of the condenser. The high-pressure cylinders have in many cases been made too large, so that the pressure of the steam was insufficiently reduced at the point of its final exhaust, and thus too much work was thrown on the condenser, involving a vitiated vacuum with consequent increase in the consumption of fuel.

The position of the cranks is a matter upon which much diversity of opinion exists. Where a pair of compound engines are coupled to the same crank shaft, it is apparently the most economical arrangement for the low-pressure engine to lead about 1-12th of a revolution, as the steam from the other cylinder then exhausts freely into the low-pressure one. If the character of the work necessitates the cranks being placed at right angles, a receiver of good capacity, and well protected against loss of heat, is of considerable benefit in reducing the variation of the back pressure in the high-pressure cylinder. If an engine be too small for the load to be driven, and its speed cannot be increased, expansive working cannot be adopted, and waste of steam ensues; whilst if, on the other hand, the engine be too large, there is great loss of steam through the friction of driving so large an engine, but often a still greater one through the large condensation of steam in the excessively large cylinder.

Experience has demonstrated the great economy and advantage of quick speed engines as compared with those running very slowly. The piston speed of many is so low that the steam admission has to be continued almost to the end of the stroke. Such engines thus work under conditions equally unfavorable to economy to those which exist in engines too small for their work. A quick piston speed is preferable; but if the engine be large in proportion to its work, rapid reciprocation may become a source of loss, if the load does not permit of a fair average pressure being maintained in the cylinder. He adds that the best results can be obtained with non-condensing engines, where the initial pressure on the piston is (say) about 60 pounds above the atmosphere, the engine being provided with expansion gear, and the speed of piston about 350 feet per minute—when the load is from three to three and a half times the nominal horse-power; this being taken on the basis of 10 square inches of piston for each nominal horse-power. If unprovided with a cut-off valve, the best load is from one and three-quarters to twice the nominal power, the steam pressure with such loads being reduced to about three and one-half to four pounds above the atmosphere at the point of exhaust. In ordinary condensing engines fitted with expansion gear or cut-off valves, and assuming 22 square inches of piston as equal to one nominal horse-power, the speed of piston being about 450 per minute, the best economical results can be obtained when the load is about five and a half times the nominal horse-power. If the engine has ordinary slide valves only, a load equal to about two and three-quarter times the nominal power would be fairly economical.

So much difference of opinion exists respecting the utility or otherwise of the "steam jacket" that its use is comparatively limited; but Mr. Hiller considers it is of great economical advantage when properly applied to condensing engines working with a high grade of expansion.

A Polysphenic Ship.

For the last six years, says the *English Mechanic*, the Rev. C. M. Ramus, Rector of East Guildeford and Playden, England, has held his invention of the polysphenic ship at the disposal of the Admiralty. This vessel, it is calculated, will skim the seas at the rate of 40 miles an hour or more. The word "skim" discloses the secret of the idea, for the invention is mainly based on the fact that if a vessel can be made by the mere force with which it moves to ride over the waves instead of driving through them, there is prima facie reason to believe that a much higher speed than anything yet reached will be achieved. The principle of Mr. Ramus' invention consists in making the bottom of the vessel a series of inclined plance. In 1872 Mr. Ramus made a model, having its bottom composed of two parallel and consecutive inclined planes; or the vessel may be described as made up of two wedges, the thick ends of which are placed abaft the thin ends. There is thus in the center of the vessel a ridge, where the thin end of the sternmost wedge abuts against the thick end of the foremost. Any floating body thus shaped must, when driven forcibly through the water, tend to rise, and if the speed is high enough it will rise on the surface instead of driving through the water. These facts were demonstrated by some rough experiments made in the presence of credible witnesses. The propelling power in these experiments was a six-ounce rocket. In one trial the model, weighing three pounds three ounces, ran a distance of 105 yards in three seconds. In another it ran 480 feet in 4½ seconds, the water being rippled by a strong breeze, but in spite of this the deck was found to be dry. The principle underlying these models, says the *Mechanic*, may be taken advantage of to construct wedge-shaped ships, for it has been demonstrated that resistance to such vessels, which at first increases about as the square of their velocity decreases as the speed is augmented, until after a certain period there is no further increase of resistance. Given the required machinery, then, for propelling the polysphenic ship and there seems every probability that speeds of 40 miles an hour and more can be attained.

Economic Production of Steam.

The *American Manufacturer* states that for 35 years persistent efforts have been made to run steam generators inside the fire-box or furnace of steam boilers. All, however, proved signal failures until Mr. Good hit upon the true principle of keeping up a steady and continuous supply of water from the boiler into the generator. No matter how intense the heat to which the latter is subjected the water cannot be driven from it into the boiler, but can only escape in the form of steam, which is rapidly generated and forced into the boiler. In the days of prosperous manufacturing few men paid much attention to their fuel bills, but the close margins to which all are now subjected through competition makes the consumption of fuel a matter of serious consideration. It has been practically demonstrated that this appliance—placed in the furnace, and connected with the boiler—will save from 30% to 40% in fuel. The time consumed every day in getting up steam will also be reduced about one-half. And what is equally important with the saving of fuel is that the working capacity of the boiler will be increased nearly one-half in power by the additional area of heating surface exposed to the flames in a position where the heat will be most effective, and by the rapidity with which the steam is generated. Hundreds of boilers, now unable to do the work required of them, may be retained by their owners if this device is used. There can be no question as to durability, for experience has shown that the circulation of water being maintained through the pipes they will not burn out any more readily than the flues of a boiler. It can be as easily attached to marine or locomotive as to tubular boilers. The low cost for which this apparatus can be furnished will, it is claimed, make its use universal, as it soon pays for itself.

American Wood Screws in England.—The New York correspondent of the London *Ironmonger* says that the American Screw Company, through its branch at Dundas, Ontario, is putting a brand of wood screws, known as the "Continental," into every important market in Europe, and that they are having some success even in Sheffield and Birmingham. There is said to be nothing on the wrapping of the packages to indicate that the screws are of American manufacture, which probably accounts for the fact that it has not been talked about in the English newspapers.

A combination of iron and steel is made extensively in France, according to the *Revue Industrielle*, by running the two metals separately into a mold, with a plate of thin sheet-iron at the dividing line. In this way, a perfect welding together of the two metals ensues.

SCIENTIFIC PROGRESS.

A New Form of Carbon.

In describing the Sawyer-Man electric light, last December, mention was made of the peculiar carbons employed, the manner of their production being a secret which Mr. Sawyer did not choose at that time to disclose.

We have now been favored with an exhibition of the process, and a very pretty experiment it makes. The carbons in question are about half an inch long, with the diameter of one-sixteenth of an inch. Their color is steel-gray, and the surface is hard as steel; within the carbon is tolerably soft.

In his earlier experiments Mr. Sawyer employed as the source of incandescence slender pencils of gas retort carbon in an atmosphere of illuminating gas. The carbons were slowly destroyed, but at the same time they took on a superficial deposit, evidently of carbon, but unlike in luster and hardness any carbon that Mr. Sawyer had seen. Inferring that a more rapid deposit would be made in a denser hydro-carbon, Mr. Sawyer experimented with a great variety of such liquids, finding olive oil most satisfactory. His method is simply to heat the carbon to an extremely high temperature, by passing through it an electric current, while it is immersed in the oil. The best results are obtained by the use of a pencil of willow charcoal, upon which an intensely hard deposit of carbon rapidly forms as the hydro-carbon is decomposed by the heated pencil.—*Scientific American.*

The Nature of Eozoon.—Dr. Dawson, in a reply to Mobius, which appears in the current issue of the *American Journal of Science and Arts*, takes exception to his arguments and reasons for pronouncing the *eozoon* to be of mineral origin, and reaffirms his belief that it represents the fossilized remains of an organic being. He (Dawson) asserts that Mobius has misinterpreted the characters of his specimens in several important particulars; as, for instance, in mistaking the veins of crysolite that traverse the serpentine and calcite for the walls of the *eozoon* chambers. Again, Dawson meets the objection of Mobius that the large (so-called) tubules are irregular and unsymmetrical, by urging that such irregularities can be satisfactorily accounted for as the effect of pressure and other physical incidents of fossilization; while the regular round and branchiug tubules which Mobius is disposed to regard as accidental, Dawson affirms to be in reality the normal structure of the organism. So far, therefore, from being settled, the question of the nature of *eozoon* is still a debatable one, with the weight of evidence probably slightly in favor of the view advocated by Dawson.

Tracing the Hudson under the Sea.—The *Atlantic Coast Pilot*, published by the United States Coast Survey, explains the origin of the curious deep holes met with along the New Jersey coast, some distance out at sea. Of these "mudholes," as they are termed, nine are known to navigators, the deepest and the furthest out being the 145 fathom hole, 83 miles southeast of Sandy Hook light vessel. These remarkable depressions, as the *Pilot* points out, bear the appearance of having been originally a continuation seaward of the Hudson River valley. They were in all probability scooped out by the river being forced to run through narrow gorges. Several of these gorges can still be traced running almost parallel with the New Jersey shore line. In fact, the soundings along the coast would seem to indicate that the whole coast line, ages ago, was many miles seaward of its position to-day; that then the Hudson river entered the ocean at least 100 miles southeast of its present mouth, and that the whole continent has since subsided, the sea encroaching further and further inland, as the country gradually sank.

Electro-Chemical Action under Pressure.—In a series of about 50 experiments, each of which continued for several hours, and during which pressures of 100, 200, 300, etc., atmospheres were maintained, A. Bouvet found the following laws: 1. The decomposition of water by a current is independent of its pressure. 2. The quantity of electricity necessary to decompose a given weight of water is sensibly the same, whatever may be the pressure. The laws are in perfect accordance with the mechanical theory of heat.

Improvements in the Telephone.—Prof. Righe's telephone, according to published accounts of its performance, must be by far the most remarkable apparatus for reproducing that has yet been devised. It it said to convey the sound of the human voice with marvelous distinctness. So much so that a large audience may distinctly hear a spoken address as delivered at the other end of the line.

Gallium Battery.—J. Reynauld has succeeded in making a battery of liquid and solid gallium by means of a metal solution of gallium sulphate. The liquid metal takes the place of zinc; the solid of copper; the former being negative in relation to the latter.—*Fortschr. der Zeit.*

Bleaching Diamonds.—Ch. Riballier recommends heating gray or brown diamonds with carbonate of lime and powdered coal in air-tight crucibles, and allowing them to cool slowly, in order to improve their color.

Brorsen's Comet.

This small periodical comet, which is now on a visit to our solar system, has recently passed its perihelion, and is now approaching the earth. It is a nebulous star, and moves so rapidly from one star to another that with even a very small telescope the observer can see the change in an hour's watching.

Its motion is from the constellation Camelopardalie to that of Ursa Major. Since April 21st the comet has been circumpolar and does not set in this latitude. Following the ephemeris of Schulse, the comet will be nearest the earth on May 10th—the date of this issue of the Press. Its place is now among the small stars in the head of the Great Bear.

This comet is now being made a matter of close study spectroscopically and otherwise. Prof. C. A. Young, of Princeton, writes to the New York *Times* saying that this comet has not an exceptional spectrum, as indicated by Huggins' observations of 1868, but falls into line with all the other comets. Prof. Young's observations were made upon the evenings of April 1st and 2d, and a comparison between the spectrum of the comet and that of the flame of a Bunsen burner showed a coincidence exact within the limits of observation.

Varying Velocity of Sound.—Some interesting experiments have been made at the U. S. Arsenal at Watertown, Mass., to determine whether the velocity of sonorous waves is or is not affected by variations in intensity and pitch. A 6-lb. brass field piece was placed in the midst of a large level field, and behind it, at distances ranging from 10 feet up to 110 feet, were placed a series of membranes electrically connected with a chronograph, which would thus give the instant at which the sound wave from the gun met each membrane in succession. The experiment was repeated many times and always with the same result. It was found that immediately in the rear of the cannon the velocity of sound was less than at a distance, but that going further and further from the cannon the velocity rose to a maximum considerably above the ordinary velocity, and then fell gradually to about the ordinary. When the gun, however, was pointed at right angles to its first position it was found that the position of maximum velocity was brought nearer to the cannon, and if the gun had been turned in the direction of the line of membranes, which was impracticable, it is thought the retardation which produced the first low velocities would probably have become an acceleration. The heaviest charges of powder caused the greatest deviations from the ordinary velocity. The experiments, accordingly, prove that the velocity of sound depends to some extent on its intensity, and that experiments on the velocity of sound in which a cannon is used contain an error, probably due to the bodily motion of the air near the cannon. Evidently a musical sound of low intensity must be used for a correct determination of the velocity of sound.—*Scientific American.*

Rise in the Waters of Great Salt Lake. Clarence King, in his late report of observations in the Great Salt Lake Basin says: "The well-known fact that the surface of Great Salt Lake is rising—it has risen 11 feet since 1867—has been generally ascribed to the cultivation of the surrounding region." Mr. King shows this to be a wrong inference, for a similar increase has affected all the lakes of the Great Basin. He shows partly from observations connected with the growth of trees on the Sierra, that this is due to a climatic oscillation that began about 1860, and which was the first of its kind and extent that has occurred within at least 250 years. This question of oscillation of climate is full of importance to the populations that are pouring into the regions of the great plains during the present moist extreme.

Changes of Spectra.—If a small quantity of mercury is placed in a hydrogen Geissler tube, E. Wiedeman finds that an induction current gives the hydrogen spectrum at ordinary temperature. But if the tube is warmed in air-bath, as the temperature rises the mercury lines appear, while the hydrogen lines grow fainter, and finally disappear. If a tube of hydrogen and nitrogen is warmed at any point, so as to free sodium or other metal from the glass, the hydrogen and nitrogen lines vanish almost entirely, while the lines of the metal appear. Does the hydrogen disappear, or is it transmuted into some other substance?—*Comptes Rendus.*

New Method of Producing Metallic Chromium.—M. Moissan has described before the French Academy, a simple method for producing metallic chromium. He agitates a concentrated solution of chloride of chromium with sodium amalgam, by which operation an amalgam of chromium is produced. This is boiled in water to remove the soda, and then distilled by heating in a current of hydrogen at about 150°. The chromium thus obtained is black, slightly coherent powder.

Retention of Heat.—M. Degremont glues upon cloth a series of small segments or rods of wood to form a sheathing for steam pipe. It has the advantage of being easily removed and replaced, which is not the case with most heat retainers. Small, round-headed nails are used to prevent contact between the wood and the pipe, and to inclose a layer of air between the pipe and the sheathing.—*Bull. de la Soc. d'Encour.*

Mining Share Market.

The fluctuations of the market during the past week give it much the appearance of a "chopped sea." It has been up and down alternately, weak one moment and strong the next, but nothing very long at any time. The prospect is problematical, though not very encouraging. There has certainly been a gain in activity. Business has increased steadily and the entire market has undergone a very perceptible hardening. This has been the general tendency. The outline, however, has been filled in with many violent, frequent, and for the most part, unexplainable, fluctuations. The stock exhibiting the most activity has been Ophir. Here, the movement may be accounted for by the late developments of ore in the incline below the 2300 level. Mexican, Union, Sierra Nevada and other north end stocks advanced through sympathy but not to a remarkable extent. Now that the new Constitution question is settled it is to be hoped that the market will become clearer and more decided one way or the other, for as it stands at present, it is simply distracting. There was a slight shading off both in prices and business towards the close of the week, but the condition of things was brighter and more encouraging than for the one preceding.

Bullion Shipments.

Since our last issue, we have noticed the following bullion shipments:

Christy, May 5th, $5,214; Paradise Valley, May 3d, $6,140; Alexander, May 3d, $9,958.27; Ophir, April 29th, $20,017.36; Independence, May 5th, $6,400; Hillside, May 4th, $5,220; Ophir, May 5th, $11,442.40; Con Virginia, May 5th, $21,094.63; California, May 5th, $52,353.07.

PAPER FRICTION PULLEYS.—A cheap form of friction pulley is now made by cutting pieces of pasteboard into disks of the size of the required pulley, pasting them heavily with hot glue and laying one over the other until the proper thickness is obtained. The hole for the shaft is cut in each piece before they are glued together, and when the wheel has been formed it may be pressed till the glue is cold. The face of the pulley may then be turned down smooth in a lathe and, to make a firm edge, iron rings or clamps may be fastened to the sides. Such paper pulleys are said to run with good usage for a long time.

MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

ALPINE.

NOTES.—*Signal*, April 30: "The Monitor and Northwestern"—"Silver Glance"—"Advance"—"Boston" mining company have shut down for the present, preparatory to another start under a new name, but doubtless the old plan. They keep two or three men employed to take care of their property in the meantime. This acrobatic company have recently undergone another change of name, thereby turning a penny or two. The Colorado No. 2 company just completed a run of about 100 tons of ore in the Boston mill, and will probably know the result in a few days. They are putting concentrators in their own mill, and hope to be able to start up in about three weeks. There is faith in the merits of the mines in this district, but not in the honesty of the men who pretend to develop them. Messrs. Griffith, Curtz, Arnold *et. al.*, will give the stockholders in this company a square deal, notwithstanding that they received their mining education in so bad a school. A few months will suffice to decide both the value of the mine and the honesty and efficiency of its managers.

AMADOR.

NEW MINE.—*Ledger*, May 3: On the 17th of March last, the South Spring Hill company commenced operations on a claim a few rods from the Keystone. The shaft they are now sinking has reached a depth of 25 ft, or timbered that far. They propose to sink to a depth of 400 or 500 ft before they commence er sscutting. The location is on the Keystone belt. All the machinery is on the ground.

THE NORTH GOVER.—This company has emerged from its litigation tangle, and now has an unclouded title to its claim. The company propose to enter immediately upon active development of the mine.

MAHONEY.—The new shaft of the Mahoney mine, at Sutt Creek, is down about 30 ft. Powerful hoisting machinery has been purchased in New York to be erected over this shaft. The superintendent expects to prosecute sinking operations right along, and as soon as the proper depth has been reached, the development of the mine will be proceeded with.

MISCELLANEOUS.—A rich strike is reported in the Gover mine. The rock is looking better than for months past. The last crushing of Downs' rock, at Volcano, yielded an average of $32 per ton.

PLYMOUTH ITEMS.—The Hercules mine closed down on Friday of last week, until after election. The Centennial mine is also idle. The Phœnix mine and mill are in full blast. Two men have taken a contract to clean out the old shaft on Green & Adon's claim.

CALAVERAS.

MURPHY'S EYE.—*Citizen*, May 3: Smith & Co. have their new hurdy-gurdy wheel in, and their mill near Murphy's is in active operation. Chapman & Co. have purchased the mill on the Oariballi mine, at Dogtown, and are putting it up near Murphy's. It will be run mostly on custom work. Collier's mine is paying well, $2,000 being cleaned up in two weeks' run. The Union Water company have a large force of Chinemen employed enlarging the Dogtown ditch. Wallace & Co. are getting some fine rock from their mine situated on Indian creek.

EL DORADO.

BRILLIANT PROSPECTS.—Placerville *Democrat*, May 3: Reports of a most encouraging character come from the Esperanza mine, near Garden valley, which N. D. Burlingham is engaged in opening and developing. At a depth of 130 ft on the ledge, about 100 ft perpendicular, Mr. Burlingham has drifted about 13 ft, all the way in ore, and has not yet reached the hanging wall. For 14 ft of distance drifted every particle of quartz that has been tested has given a good prospect. It is, thus far, the finest mining development made in El Dorado county for many years.

RICH ROCK.—*Republican*, May 1: Some of tho richest quartz specimens seen for a long time were lately exhibited by Mr J. W. Johnson, who, with his father and brothers, have a mine on or near French creek, Mud Springs township. The specimens contained from $10 to $30 each, all containing considerably more gold than quartz. Most of the gold taken out is of this character, and many thousands of dollars have already been secured from the claim, all of which has been worked in a hand mortar.

MILL QUARTZ.—Cal. Duden, railroad agent at Latrobe, has a 10-it ledge at the depth of 100 ft, and enough drifting has been done to establish its permanency. Negotiations for its sale to a Boston company are now pending, at a handsome price. There is no doubt but that the sale will be speedily consummated, and that it will he the means of developing other rich mines in the vicinity. It ie the intention of the parties negotiating to put up a first-class mill and hoisting works at once, already having satisfied themselves of the character and permanency of this ledge.

INYO.

THE INDIANA.—*Independent*, April 20: Such is the name of the principal mine, so far as opened, of the newly discovered series above and about three miles from Swansea, belonging to Messrs Boley & Turtle. They are now extracting ore of astonishing richness, from a vein ronging from 15 to 18 inebes thick. Ten tone of ore are now on the dump, assaying from $800 to $2,000 per ton, which will be shipped to merket as soon as eacks can be obtained. The ore is covered with patches of a light pink colored horn silver. James Hanger has located another claim in thet vicinity, showing the eame class of rich ore, which is now being prospected. Considerable attention is being attracted to that region.

MINOCK.—Work at all points is going ahead well and continues favorable. Tunnel 1000 level was run 39 ft last week, making a total length to date, 1,481 ft. Shaft from 300 lovel was sunk 11 ft, and ie now down 386 ft. Distance made in upraise tor the week, 14 ft, giving present hight of raise 96 ft. The ground beyond the cave is soft limestone, breaks well, and the tunnel is making good progress. They are crowding work ahead as fast es possible in shaft and upraise to make connection for air. The length of tunnel makes it necessary, while stoping upraise, to utilize all tho air that can be forced in at the breast. The addition of small boiler gives much better air than heretofore had, but not in such quantity that they can dispense with any considerable portion of it for other purposes. General appearance of ground at points where work is being carried on is very favorable.

SNOW'S CANYON.—Snow's Canyon mill, under lease to Birchett & Parker, and under forcmanship of J. H. Grove, started up for a continuous run. The first lot of ore to be worked is some nine tone from the Virginia mine, belouging to Groves & Mitchell. A lot of 44 tons now out at the dump of the imperial, belonging to Ross & Smith, will be reduced, together with the amounts to be extracted by a force of six miners as the work progresses. The St Elmo mine, the property of Freeman & Logue, has taken out some 10 tons, while many other prospecting parties have on hand from 1 to 10 tone each. The ore is of high grade common to the Snow canyon mines, conteining gold and eilver. Prospecting has taken a material advance in the district, and in all probabilities the mill will not have occasion to shut down for some two or three months to come.

MARIPOSA.

PRINCETON.—*Gazette*, May 3: Mr. D. Gourguet, Superintendent of the Merced River tunnel, has struck it rich in that claim. The vein is large, measuring three ft, and the ore is unusually rich, assaying way up in the hundreds.

FERGUSON MINE.—This mine is situated on the meln Merced river, about five miles west of Hito's Cove, and is now in successful operation, running a 10-stamp mill by water-power. The proprietors are Mr. John Ferguson, Isaac Hall, Leachman and Sherwood, under the style of the Ferguson mining company. Mr. Robert Francis is the Superintendent, and Mr. Joseph Opie the blacksmith. The total number of men employed a out the mine and mill is 16. The shaft, which is about 212 ft, and the hoisting works are about 1,000 ft from the mouth of the main tunnel. The hoisting works consists of an undershot horse-whim of the latest improvement, capable of hoisting 1,000 pounds to the bucket. The mill crushes about 12 tons of quartz in 24 hours. This company obtain their supplies principally from Sonora, Tuolumne county. The rock is rich in free gold and the company is prospering.

MONO

THE OAO MINE.—*Standard*, May 2: This property is situated on the summit of Silver hill, north and east of the Noonday, and directly east of the Red Cloud. The shaft is down 100 ft. It is a double-compartment, four by four, and timbered from top to bottom in first-class a yle. At a depth of 200 ft, crosscuts will be run east and west for the three ledges belonging to the company. Thomas Steel is Superintendent.

ADDENDA.—The water is troubling a little in bottom of main shaft, now down a depth of 400 ft, and it is the intention to put in a Cameron pump, which is expected to arrive here soon by fast freight. The present boiler is of capacity to make steam for the extra engine, which will be set up at the 400 level, and the steam carried down in a two-inch pipe. Of course, if any great body of water should be encountered in the mine, it would put the pump to the test very soon. It is expected to prospect the claim to a depth of 100 ft at least below the level in qusation. The quartz in the bottom of the shaft is of better grade, and there is more of it.

GOODSHAW.—The east crosscut, 450 level, is in 200 ft, an advance of 17 ft. The west crosscut is in 125 ft, an advance of 14 ft. The formation in the east is of an excellent character of iron-stained porphyry, with occasional seams of quartz. The west crosscut is in hard, blasting rock.

THE ORIENT.—The east crosscut is in 165 ft, an advance of 17 ft during the week. A ledge was cut in this drift, samples from which assay from $40 to $100 per ton.

THE BODIE TUNNEL.—The tunnel is in 920 ft. The formation is a blue bird's-eye porphyry, very favorable to the working of a vein. The air continues excellent, owing to the fluo which is carried under the track floor.

STANDARD.—On the east crosscut, 300 level, toward the Summit, from the main drift south, a good ledge has just been cut at a point 200 ft east, prospecting well. It has been decided to put in this big pump right along, and stone for the engine foundation is being obtained near Huntoon's ranch. The engine will be placed inside of the main building. Where the air compressor was set up, foundation for two extra boilers was also prepared. It will probably require three months to complete this work. The crosscut on the 700 level east has developed a much softer and more favorable formation, es if a ledge were making of importance. The winze sinking on the Burgess ledge, near the connection of drifts between the Standard new shaft and the Bodie claim, has come upon rich ore again, while the Bruce works, on the Standard side, are as rich in free gold as ever, and the ore faces hold out in size over the drifts. One of the most singular, and possibly important features of this portion of the claim, is the appearance of horn silver in connection with the free gold; this is considered very suggestive of both great permanence and importance. The Gildea ledge, one of the most clean-cut and important in the district, never looked better than it does to-day, and in the Standard claim. One thousand tons of Standard ore will be crushed at the Syndicate mill.

NEVADA.

THE DRAIN PROJECT.—*Union*, May 4: The contract between the New York Hill and New Rocky Bar mining companies has been ratified by both, by which the drain tunnel from the first named mins shall be extended into the ground of the latter, by wh ch it will be drained to a perpendicular depth of 200 ft and thus relieve it of the surplus water which is troublesome in a wet season. Operations will be first commenced by putting up pumping machinery on the old Chavanne shaft (though the Rocky Bar was worked many years ago) and pump it out. When this is accomplished, the work of driving the tunnel will be commenced at both ends and prosecuted as fast as practicable. The distance to be run is ab ut 300 it. The waste rock will be hoisted out by the respective companies, the New York Hill having bargained to raise the rock from their end of the tunnel at a fixed price per carload. The Rocky Bar company is now calling for bids for retimbering the Chavanne shaft down to water level, preparatory to the putting in of a pump. The water is now standing in the incline to the depth of about 250 ft.

SCADDEN FLAT.—Superintendent Richard Roberts hae magnificent specimens of gold-bearing quartz just taken out by tributers in the Scadden Flat mine. They were taken from new ground on the first level, where the ledge is strong and firm and pitching downward in ground that has never been worked.

MISCELLANEOUS.—*Foothill Tidings*, May 3: Work on the new air shaft at the Idaho mine is proceeding as rapidly as possible. About 200 ft of ground has yet to be opened through. When completed, this air shaft will give good ventilation from the tenth level to the surface. The Argenta mine has struck good pay ore and holders of stock are jubilant over their prospecie. Some of the machinery to be used on the Schmidt mine has been put in place, and work is being pushed rapidly ahead so as to get the mine in running order, as soon as possible. A drift is now being opened in the new incline of the Idaho mine 180 ft below the 10th level, or 1,150 ft below the surface. After this is fairly under way the work of sinking the incline deeper will be resumed.

RICHMOND.—*Transcript*, May 4: About one mile east of the Omega company's property, is the Richmond mine, on Diamond creek. For nine years past T. P. Merrill has had possession of thie claim. He has never worked it for himself on an extended plan, being about 70 years old, and too feeble to engage personally in its development. He has leased portions of it to private parties on different occasions, and it is ostimated that about $20,000 has been taken from the ground. The claim is surrounded on two sides with deep canyons, and the facilities for hydraulicing are first-class. It has recently been bonded to W. R. C. Smith, of San Francisco. It is understood that the terms of the bond are $10,000 cash—a very reasonable sum for the mine. The claim comprises about 1,000 square ft, a mere handful of which has been washed off in one spot where it peyed well.

PLACER.

MINING ITEMS.—Nevada *Transcript*, May 1: The Southern Cross and Polar Star mines, at Dutch Flat, are working very heavy material. Their dump is 300 ft below the tunnel, and is in Bear river. They have two tunnels, which will take out 50 acres to a depth of 200 ft. The earth will pay 20 cents a cubic yard, which is very rich. The Cedar Creek company has only 48 ft of fall, and it is thought will not run 10 years. They have washed off their mines to a depth of 175 ft, and have now between 175 and 200 ft of their best dirt below the present surface. The Bonanza mine, at Gold Run, dumps into Canyon creek, a tributary to the American. The bed is inclined so steeply that all the tailings go out, and the mine could be worked forever if it would hold out. It is on the Blue Lead, and is very rich on the bottom. The bedrock is cleaned up carefully, and a good deal of coarse gold found. A chunk worth $160 was picked up a little while ago, and pieces from the size of a grain of wheat to several ounces are frequent.

SIERRA.

LA PORTE ITEMS.—Cor. *Messenger*, May 3: Most of the mines are doing well. The Union claim, at Gibsonville, struck something rich a short time ago. The Highland Mary company, at Wahoo, have let a contract for the raising of a shaft from their tunnel, and are confident of striking pay in a short time. The Secret Diggings company of this place are cleaning off a large quantity of ground, more having been run off thus far than was anticipated would be got off in the whole season. At the annual meeting of the Highland Mary company, held a few weeks ago, the President, Secretary, and trustees were all re-elected.

NEW STRIKES.—Last summer a number of citizens, of Sierra City, located a mining claim on the South branch, about four miles above the city, and commenced work upon the same. A few days since they reached the channel and found a large body of blue blue gravel, which prospected 50 cents to the pan. The owners are jubilant, believing they have valuable property. The tunnel is 350 ft long. A Spaniard by the name of Martini has struck a rich gravel deposit about two miles above the old Phœnix quartz ledge. The prospect is said to be a large one. Recently Capt. Irelan, Rock creek, in 600 ft with his tunnel, raised up 15 ft, striking gravel, and out of three carloads realized $8; average pay per carload for 17, afterwards taken out, $1. Good prospect of continuation of pay channel.

NEVADA.

WASHOE DISTRICT.

OPHIR.—Gold Hill *News*, May 7: The south drift from the winze below the 2600 level, is now 54 ft in and continues in excellent ore. The bottom of the incline is in a very likely-looking body of quartz, giving assays from $10 to $90, the greater proportion of which is gold This lies next to a clay seam varying from four inches to one ft in thickness, dipping to the west This formation has been penetrated about 15 ft. Toward the bottom of the incline the slips of clay in the ore-body dip toward the east. The quartz is very kindly in its appearance, and the surrounding porphyry shows iron freely.

SIERRA NEVADA.—The incline is making better progress below the 2300 station, the bottom continuing to cut a formation of hard quartz containing alternate seams of high and low-grade ore. A seven-inch Cameron pump has been put in the bottom, and the water gives very little trouble, although the flow continues strong. Ore continues to be shipped to the Mariposa mill, which will soon be started up. One of the pumps for the east shaft has arrived.

MEXICAN.—The joint Union upraise from the 2200 level to meet the winze coming down from the 1600 level, is making three ft per day, and is now 100 it upon the slope. Water has rendered the increase of depth to the winze slow, the average gained being less than two ft per day.

CON. VIRGINIA.—The yield of the mine is about 150 tons per day. The joint west drift, 850 level, is averaging five ft per day through hard, blasting porphyry, and is now 124 ft in length. The hoisting for the mine is now done through the Con. Virginia shaft.

JUSTICE.—The west crosscut, 1150 level, continues to cut seams of quartz and low-grade ore. Crosscut No. 1 west, 1550 level, has cut into a fine vein formation which carries more and heavier stringers of quartz as the drift is driven toward the wall. The Waller Defeat workings continue their accustomed yield.

BELCHER.—The main incline has reached a depth of 142 ft on the slope between the 2600 level, and is making downward at the rate of three ft per day. The south drift, 2550 level, is now 390 ft in length, and in favorable looking ground.

CALIFORNIA.—The yield of ors has been 285 tons daily. Owing to repairs to the machinery at the C & C shaft, no hoisting is being done for the California. The final clean-up for April has been made and shipped. Total for the month, $430,013.24.

BULLION.—The only work going on in the mine the past week has been sinking the incline winze below the 2150 level. As soon as it is a little further down the engine will be placed at its top.

BEST & BELCHER.—An average of three ft per day is being made in sinking the Osbiston shaft; total depth, 650 ft. Five ft per day have been added to the length of the drain tunnel.

LEVIATHAN.—The face of the south drift, on the 730 level, has run into a very favorable looking formation of porphyry, quartz, clay and heavy streaks of low-grade ore.

BROFUY.—The work of development through the North Bonanza tunnel is making excellent progress. The ground looks favorably, showing quartz and veins which are mineral bearing.

NORTH BONANZA AND FLOWERY.—The water has run down so as to give but little trouble. Six ft per day is being added to the length of the drift north from the first station.

GOULD & CURRY.—The joint east drift, 1700 level, is being extended toward the perpendicular of the Gobiston shaft at the rate of five ft per day. A 20-inch air pipe has been extended to the face, giving needed ventilation.

WARD.—The main shaft is down 1,415 ft. The water coming in is increasing in temperature. The east drift, 800 level, is now in 545 ft.

SILVER HILL.—The north drift starts 410 ft east of the incline. The 1300 level will be reached in the incline about Saturday.

LADY BRYAN.—Still sinking; drifting north and south on the 600 level and crosscutting east at a point 135 ft south of the main east drift.

CHOLLAR-NORCROSS-SAVAGE SHAFT.—The water comes up in the shaft at the rate of about five ft per day and has a temperature of 128° Fahr.

EXCHEQUER.—The work of placing the new Con. Imperial air compressor is delaying operations on the 2400 level.

CALEDONIA.—The winze below the 1600 level is being continued, and is without material change. The Formen shaft is making usual progress Total depth 625 ft.

HALE & NORCROSS.—The joint Mexican winze below the 1600 level has made slow progress of late on account of water but is now doing better. Its total depth is 385 ft on the slope, the bottom in favorable vein matter. Six ft per day are being added to the length of the main north drift 2000 level, and it is now in 245 ft from the south line.

JULIA CON.—The work of repairing the caved drift, 2000 level, has been interfered with by the breaking of the pump which allowed the water once more to flood the floor of the drift, rendering the temperature high again.

YELLOW JACKET.—The new shaft has reached a depth of 2487 ft. The work of excavating is making good progress, nine ft having been made.

UTAH.—The work of lowering the large V-bob has been completed and it has been set up at the head of the incline. A new track is being put in the incline.

ALTA.—The joint, three compartment incline winze has reached the 1750 level, and the work of chambering out the station at that point is progressing favorably.

SAVAGE.—The retimbering of the incline is being continued as usual, as also is the work of repairing the drift, 1600 level, connecting with the Curry.

CROWN POINT.—The winze below the 2500 level is being continued on down and is 230 ft on the slope in depth.

TROJAN.—The mill has been set to work on 1000 tons of accumulated ore. Development on the 3d level is being prosecuted as usual.

CON. IMPERIAL.—The new air compressor is in place, but all connections not perfected so as to put the machinery into operation.

SUTRO TUNNEL.—The sub-drain is making satisfactory progress, the work being extended over 10,000 of the 20,000 ft.

MT. HOOD & VANCOUVER.—The work of drifting to the ledge on the 1400 level is making good progress. Everything works well and the water flowing into the shaft is easily haddled.

BELMONT DISTRICT.

BELMONT.—*Courier*, May 3: The mine is looking well. They have during the week started a drift from winze at a depth of 70 ft running east on the vein, and is showing richer ore every foot they advance it. The belief is now that it is going to be a larger body of ore than any ever found in the mine. The 50 level running west is in 19 ft in a 3-ft vein of quartz, one-third of which is fine ore. Have advanced the 300 level drift from shaft 22 ft, from south raise 10 ft.

BROUBRIDGE.—They will soon have the sump sunk deep enough, when work will be resumed on the 6th and 7th levels as usual. The mill was shut down on the 25th until such time as the different works and stopes are in shape.

EUREKA DISTRICT.

EUREKA TON.—*Sentinel*, May 1: Mining operations have been continued through the week without any material change, except in the 13th level, where the indications for ore are more favorable. The following work has been done in the different levels: 4th, north crosscut continued 22 ft, and now in 97 ft; 5th, east drift continued 22 ft, and now in 40 ft; 13th, started drift running east from crosscut No. 1, and made 16 ft. West drift from crosscut No. 1 continued 19 ft, and now in 29 feet. Incline continued 10 ft, and now down 40 ft below station.

NEW ENTERPRISE.—A new tunnel enterprise is about being inaugurated at the head of New York canyon. The Atlantic and Pacific Tunnel Co was incorporated a short time since, with R. Sadler, as President; W. P. Steichelman, Secretary; O. P. Burgess, Superintendent; T. W. Pearson, treasurer. The object of the association is to develop, by means of a tunnel, certain mining claims on Prospect mountain near the head of New York canyon. Among the claims belonging to the company are the Lantern, Sagebrush, Welch King and East Oakland. The length of the tunnel will be about 1,000 ft, cutting the ore belt at a depth of about 750 ft. The ground is regarded very favorable for rapid progress, and it is believed that the tunnel can be run in eight months. All of the above mines show well at and near the surface. On the Lantern in particular the ore has been followed down to a depth of 250 ft. The rest of the series are believed to be equally as valuable. The company is organized with 100,000 shares, 25,000 shares of which will be set apart for a working capital.

PARADISE DISTRICT.

WILLOW CREEK.—*Silver State*, May 5: The Ethan Allen ledge crops for several hundred ft along the side of the mountain in which it is situated, and is from 15 to 50 ft wide. The owners have cut into the croppings some 8 or 10 ft and find that it is all ore which averages over $100 to the ton in silver. Some mining men from Virginia City have been to examine the mine with a view of purchasing it. All the Willow creek mines are situated at the extreme head of Willow creek, on a ridge between the forks of that stream, some six miles from Camp Scott, in Paradise valley, and about a mile north of the summit of the range which divides Paradise valley from Willow creek. Six promising ledges have been located on the hill in which the Ethan Allen is situated, and the whole surface of the ground in the vicinity is covered with ore.

REESE RIVER DISTRICT.

WESTERN NYE.—Belmont *Courier*, May 3: The Lodi ledge, owned by Holman & Hawke, situated about two miles north of the Illinois works, is prospecting well. At a depth of 160 ft on the incline they have a well-defined ledge seven it wide of free milling ore, which assays from $300 to $600 per ton. This ore is chloride and black metal with some galena. The Downey company ore working 18 men. They are down on the incline 600 ft, at which depth they have a fine looking 9-it ledge of gray carbonate ore and galena; the latter is richer in silver than any of that character found before found. Capital is all that is wanted to make this a splendid property, and that is confidently expected to be along soon. The company are still sinking. Among the new developments in Mammoth district may be noted the San Francisco ledge, owned by G. E. Crowell, and situated near the summit of the Mammoth range, about two miles from the town of Ellsworth. Mr. C. has followed the ledge by incline over 40 it, and has a large and well-defined ledge of milling ore, assays from which run as high as $1 500 per ton. Other ledges in the vicinity are showing well, and capitalists from Virginia City contemplate taking hold and erecting a new mill there. Thomas Mitchell, a well-known millman from Tybo and Belmont, has taken charge of the Alexander mill as foreman.

SILVER STATE DISTRICT.

JOTTINGS.—*Silver State*, May 5: Men are steadily at work on the Blue Bell and Blue Jay claims. They are now sinking a perpendicular shaft on the Blue Bell, and expect to cut the lead this week. In Jungo district, three or four companies are at work and the prospects for good mines are very flattering, as the ore on the surface is rich and the ledges well-defined. A fine body of ore was cut in the Ohio ledge on Willow creek last Saturday. G. W. Hinkey reports the Bullion looking larger and richer where they are now at work on it, than the Rough & Ready did on the surface. The Bullion is now producing the richest kind of ore, and there is a large body of it in sight. The Sedan mill is running on ore from this mine, and the bullion which it is producing will speak for itself.

ARIZONA.

TOMBSTONE.—*Star*, May 1: Parties recently from Tombstone report everything in a flattering condition. Work is being rapidly pushed on the Lucky Cuss mine, and the Contention is still going down, and will soon reach 200 ft, every day being a guarantee of its stability and permanence, the richness and quantity of the ore being well established. At present the Toughnut has quite a force, and work is being rapidly pushed forward, large quantities of ore of more than ordinary richness being taken out. A great deal of assessment work is being done at present in this wonderful district. The mill at Charleston is nearing completion, and is expected to commence operations shortly. The Vizana, adjoining the Toughnut, upon which a considerable amount of work has been done, at a depth of 15 ft, shows a large body of ore assaying $1,000 per ton.

GLOBE.—*Silver Belt*, May 2: The Chamber of Commerce, owned by Hise, Hills & Co., is looking very fine. They have let a contract for a 30-ft shaft. S. Klein & Co. received 15 ounces this week of gold bullion from Gold Hill district; 13 ounces of this was from five tons of Golden Eagle ore, worked in an arastra. There are still 25 tons of ore on the dump awaiting reduction, which assaye $51 in gold and 30 ounces in silver. S. Klein is pushing work on the Bohemia, which is looming up. This is one of the most flattering prospects in the district, having the richest character of silver ore from the surface to the bottom of the shaft, 40 ft, which is sunk in ledge matter entirely, consequently the width of the vein has not been ascertained. The El Capitan still yields profitably to its owners. Twelve tons of good ore, assaying over 500 ounces per ton, is at the mill awaiting reduction. The proprietors are preparing stoping ground with a view of extracting large quantities this summer for milling.

OREGON.

MINING NOTES.—*Sentinel*, April 30: New diggings have been discovered on Dutch gulch, a tributary of Briggs creek, in Josephine county, and miners are flocking in and locating claims. The Palmer Creek company have cleaned up and suspended for the season. The result proves the mine to be a valuable one. Klippel, Hanna & Co. have commenced piping in earnest, with excellent prospects. This company will have water during the greater part of the summer. Water has commenced failing in most all of the mining camps of this and Josephine county, and a clean-up will soon be made. The season has been a very short one, but the returns promise to be good, nevertheless. A. McKenzie, Superintendent of the Centennial mining company, at Willow Springs, will return to Oakland, Oregon, this week. He expects to secure a "Little Giant" while absent, and return next fall to continue operations on a larger scale. The news from Briggs and Silver creeke continues encouraging. A man from the first-mentioned creek arrived at Grants Pass yesterday, who reports $200 men in that locality. Most of the men have claims, and ground sluicing has been commenced in earnest, with good prospects.

A LAW prohibiting opium smoking in Nevada under a penalty of $1,000 fine or two years imprisonment went into effect on May 1st.

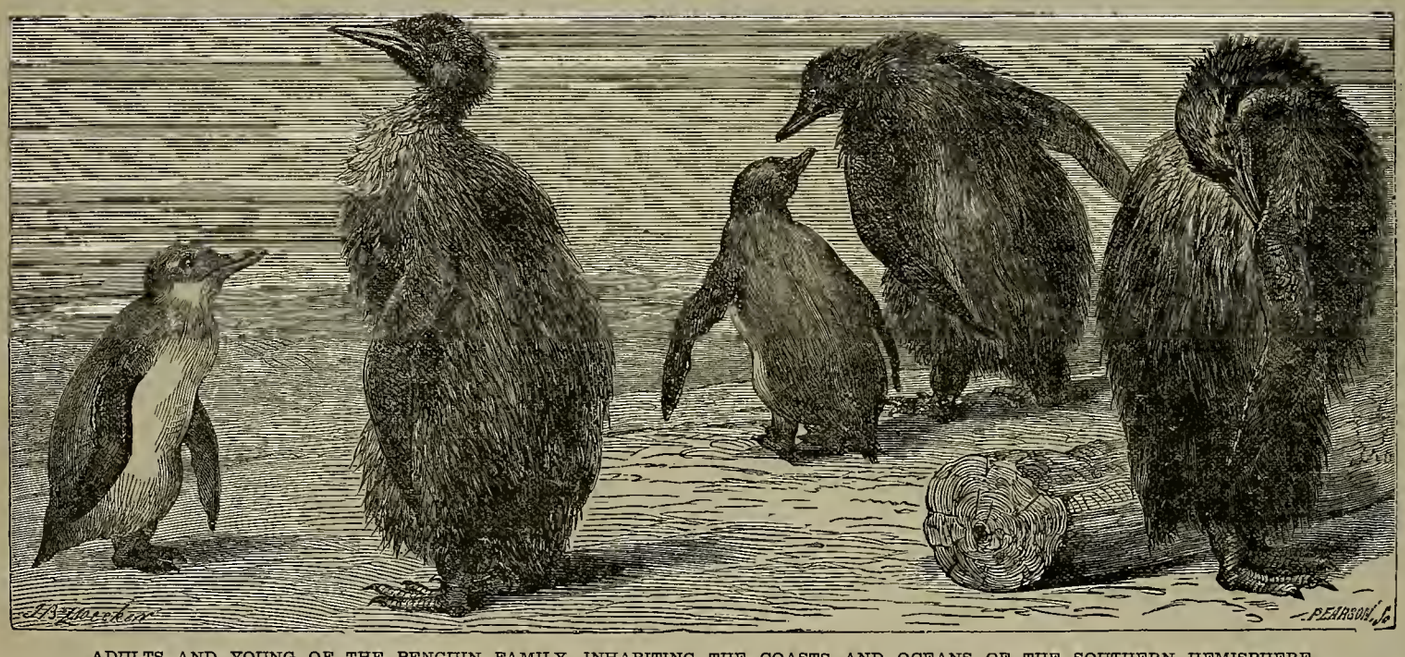
THE New York exposition for 1883 will take place at Port Morris, Westchester county.

A Group of Penguins.

Our engraving shows a group of interesting hut decidedly ugly hirds. They are of the penguin family, the name penguin heing a corruption of "penwing" or "pinwing," meaning a hird that has apparently undergone the operation of pinioning or pinwinging, as it is, in at least one part of England, commonly called. Although the name penguin has been applied to sea fowls inhahiting northern coasts, it is now restricted hy naturalists to hirds representing a peculiar family *(Spheniscidæ)* exclusively inhabiting the ocean and coasts of the southern hemisphere. These hirds shown in our engraving are of the *Spheniscidæ*. According to the classification of Dr. Elliot Cones there are four genera and twelve species included in the family *Spheniscidæ*. From an article in Johnson's encyclopedia, written hy Theodore Gill, we learn that most of the penguins inhahit the colder regions of the southern hemisphere, and species have heen found in the Antartic seas as near the pole as travelers have penetrated. All the species live in communities. They are incapable of flight, hut are very powerful swimmers and their wings are used as fins. They live along the coast and when at rest sit upon their tarsi in an erect position, as shown in the engraving. In this posture, too, they walk, or rather waddle, till they approach the sea, when they throw themselves in, and are again at ease.

According to Dr. Kidder "no living thing that he ever saw expresses so graphically the idea of *hurry* as a penguin when trying to escape. Its neck is stretched out, flippers, whirring like the sails of a windmill, and hody wagging from side to side as its short legs make stumhling and frautic efforts to get over the ground. There is such an expression of anxiety writteu all over the bird, it picks itself up from every fall, and stumhles again, with such an air of having an armful of hundles, that it escapes capture quite as often hy the laughter of the pursuers as by its own really cousiderahle speed." One can easily appreciate this humorous sketch by noticing the awkward outline of the hird in the center of the engraving. The little chap upon the left can also he laughed at. He stands with his flippers hanging down in a disconsolate manner, and reminds us of the little figures we have often seen standing in the snow at the Eastern schoolhouse door, waiting and shivering until the schoolma'am puts in an appearance and unlocks the door.

Of the peuguin in general it is said that the water is their natural element, and in this they disport themselves with ease and grace. They are expert divers, and hy repeated incursions into the depths, catch the fishes, crustaceous and mollusks, upou which they feed. The females lay one or two eggs cach, according to the epecies, generally in slight depressions of the ground or in hurrows.



ADULTS AND YOUNG OF THE PENGUIN FAMILY, INHABITING THE COASTS AND OCEANS OF THE SOUTHERN HEMISPHERE.

A Curious Cave.—Some time since N. Bell, of Pinos Altos, while out hunting near the Mogollon mountains, came upon a large cave which, upon examination, was found to contain carved stone images, and various other articles of human workmanship. The cave is of natural formation, being about 100 feet in length by 20 feet wide and 7 feet high. The walls are elahorately ornamented with grotesque figures, wrought in colore the brilliancy of which is still well preserved. Mr. Bell had no time to make a thorough examination, hut satisfied himself with hringing away euch of the images, etc., as he could conveniently carry, purposing to return at an early day and complete his examination. One of the images, measured about two feet in length and weighed nearly 40 pounde.

Fine Gold.

It is a fact that has heen long known, says the *Idaho Statesman*, that fine gold is very generally and evenly diffused throughout the gravel and sand which have heen deposited hy the water dnring the ages that the Snake river has been gradually subsiding and finding its way down to its present channel and course. Throughout the entire course of the river, these gravel and sand deposits cover extensive areas along each hank of the stream, all marked hy the same general character, except where the river passes through mountain rangcs where the gravel is confined to the present hed of the stream. Efforts bave heen made from time to time to work these gold-bearing deposits, hut the gold proved to he too fine to he saved hy the process then known, though at some points considerahle mining was done, and in some cases with fair results.

Since the introduction of the new process for saving fine gold, all douht as to the value of these placers has given place to certainty. In no single instance where the ground has heen worked hy the new process has there been failure to realize satisfactory results. Already a large numher of claims are worked at various points along the river for a distance of over 200 miles. New enterprises of all kind are daily heing commencod and during the present season and the next nearly every mile of this section of the river will have a series of gold-saving machines at work. It is true that the cost of the plates and the expense of getting to work on a claim require some capital to hegin with, but as the gold is known to exist in paying quantities nearly everywhere, there will always he men of sufficieit means ready to engage in a husiness which has heen proved to he so profitahle.

Compared with coarse gold placers there will not he so many men employed; but there will not he the fruitless prospecting, the mauy failures nor the large nnmher of men who in coarse gold placers are often out of employment and woree than idle.

Placer mining on Snake river will not throw so much gold out of the ground in as short a time, hut as an industry it will he more permanent and enduring and more certainly remunerative for those engaged in it. The numher of people engaged in the husiness will increase as rapidly as the machines are multiplied, and everyone thus engaged, whether as employer or employed, will he doing a perfectly safe business.

The winters are never severe along the river and snow never falls deep enough to prevent work. Mining can he done for nearly every month in the year.

The mines will last for many years and the yield per claim will he ahout as great one year as another. While they are heing worked, they will afford an excellent market for the farm products of the neighhoriug plains and valleys. Long before they are exhausted, the problem of irrigating the fertile sage lands of the Snake river plains will he solved hy the ditches which will he taken from the river ahove and extended over the plain. Indeed the cultivation of the sage lands near the river and the mining operations ou the hars will in may instances he prosecuted together.

A New Way of Working Steam Expansively.—A. Mullcr, of Cologne, connects a numher of turhines in a common casing, the diameter of the turhines gradually increasing. The eteam enters the smallest and escapes from the largest. This contrivance is said to he very economical either for eteam or under a head of water.—*Dingler's Journal.*

Distribution of Fish.

The Fish Commissioners continue their activity in the commendahle work of stocking the lakes and streams of the State with fish. They recently distrihuted 40,000 Cloud river and 50,000 Eastern trout, and also 10,000 catfish. The Eastern trout were placed in the summit streams and the Cloud river trout in the coast streams. The white fish recently hatched—40,000 in uumher—were put in Eagle lake, Lassen county, Donner, Tahoe and other lakes.

The 40,000 land-locked salmon ordered for California hy the United States Commissioner will not come this season. The weather has heen so cold in Maine and the temperature of the water correspondingly low that the hatching was retarded. The Commissioners have telegraphed not to ship the eggs.

Next month Livingstoue Stone, acting under the direction of the Government Commissioner, will hring out a car load of lohsters, striped hass and eels. The lobsters will he placed near the Heads or the Farralones. The hass will he distrihuted in the hay at points where the streams come in. The eels will he put in sloughs connecting with salt water. The eels hrought here three years ago have done well. Several have heen caught. One was three feet long.

Shad are becoming quite plentiful. Mr. Redding estimates that ahout 100 a week are caught. They are readily picked up hy cpicures, and therefore have not come into market. A fair sized shad is worth two dollars. They are taken mostly in San Francisco hay. Some, however, have heen taken at Monterey. Next year 500,000 more will he placed in the waters of this coast.

The aquarium car, which comes out uext month, will bring a lot of youug king carp of the kind imported from Europe to the Eastern States some years ago.

Mr. Redding is quite euthusiastic on the suhject of raising fish for food. He says every farmer who has a windmill on his place can with little expense arrange to raise all the fish needed for a family and have plenty to spare. Mr. Davis, who resides at Brighton, near Sacramento, has a reservoir containing 100,000 perch, carp and catfish. Some yeare ago he dug out a reservoir of ahout a half acre in area, and when his windmills were not at work irrigating, the water was diverted into the fish pond. The depth of water on the average is three feet. He stocked the reservoir with fish, and now has an abundant supply for hie own use and some for the market. Mr. Redding saye other farmers can do the same thing and save large expense for meat.—*S. F. Bulletin.*

The Future of Leadville.—Leadville will continue to he a prospcrous mining camp, settling down to a town of a few thonsand inhahitants, hut will never he the city that eome have predicted. Nothing will grow there. There is no soil, and there is ice formed every night in the year. It rains every day from the middle of June until the last of Septemher, all the time in the afternoon, hut the mornings are frosty and icy. Thcre is absolutcly nothing to sustain it but the mines, and when these hecome located and all the paying leads are found, and the day of prospecting is over, theu will Leadville settle down into a prosperous and thrifty town, hut never a live, hooming city. It is too high up for a health resort, and those looking for health would do well to stop 3,000 or 4,000 feet helow. There is not a foot of ground within four miles of Leadville, in the direction where ore has heen found, that is not now taken up; and all of the mining region within four miles of Leadville is shingled over four inches deep—that is, covered with conflicting claims.—*Denver Tribune.*

The Engineer.

The Suez Canal.

Mr. Farman, U. S. Consul-General at Cairo, Egypt, furnishes the Department of State with an interesting article on the Suez canal. His facts are derived from authentic sources. A few of them are selected of remarkahle interest. The entire cost of the canal was $92,273,907. The stock of the company consists of 400,000 sbares, at 500 francs each. These shares have sold as low as 100 francs each. At the opening of the canal they had advanced to only 300 francs. They are now quoted at 717 francs, and are prohahly worth more. The British government paid ahout 568 francs. The numher of shares hought, in 1875, hy Lord Beaconsfield was 176,602. This great purchase, aside from its political and commercial advantages, thus affords a clear profit of 25,000,000 francs at present prices. The halance of the stock is held hy a large numher of persons, mostly in France. The revenues of the canal have increased from 5,000,000 francs in 1870 to over 30,000,000 francs in 1877. The expenses, including interest, sinking fund and lands, have heen a little over 17,000,000 francs per year. While the revenues steadily increase, the expenses are decreasing or stationary. Deducting the amount paid for interest and the sinking fund, the actual expenses are ahout 5,000,000 francs annually. The cost of cleaning the canal and its accessories is only ahout 2,000,000 francs per annum. The small comparative cost of maintaining the canal arises from the fact that there are no locks or lateral emhankments to he broken. Except the ordinary cleaning, there is little to he done. Vessels drawing 25 feet of water or less pass through the canal. The saving of distance to the British ships going to India is nearly 5,000 miles. Two-thirds of all the vessels passing through the canal carry the English flag.

Monsieur Ferdinand Lesseps, who has heen at the head of the enterprise since its heginning in 1854, expresses the opinion that the Panama canal mnst he constructed without locks to he successful or remunerative.

The Railways of the World.

The growth and development of the railway systems of the world have heen truly wonderful, and, as year hy year goes on adding to the numher and extent of these avenues of intercourse, the figures hecome formidahle. There are now 82,000 miles in the United States, an increase of 2,486 miles since 1877. The outlook is very flattering for a still greater increase in 1879, if the many plans now under consideration are put into execution. By a comparison of other nations it will he seen that this country stands far ahead of all othere in the extent of its railroads:

United States	82,000	miles
Germany	17,181	"
Great Britain	16,794	"
France	13,946	"
Russia	11,555	"
Austria	10,852	"
British India	6,527	"
Italy	4,815	"
Canada	4,200	"
Argentine Republic	990	"
Egypt	975	"
Peru	960	"
Brazil	836	"
Turkey	830	"
Total	172,461	miles.

To properly appreciate the advantages of the railway syetems one might imagine the commerce of the world carried on in the old-fash-

ioned way. Think of the world of traffic that glides over these lines in a day, a month, and a year, and calculate, if one can, how long by teams, over muddy roads, through morass and jungle, and swamp and over desert plains, it would take to do the transportation which these railways do in a single day, and some conception may be formed of the magnitude and importance of the world's railway system.—*Chicago Commercial Advertiser.*

SUBMARINE WORK IN NEW YORK HARBOR. Gen. Newton has resumed work for the season on Diamond reef, between Governor's island and the Battery, having sent down the scows with apparatus for submarine mining. He finds that a heavy deposit covers the reef, but not of such hardness as to admit of the use of drills and explosives. A hose, with priming attachments, is therefore employed, preparatory to reducing the surface of the rock by other means. At Flood rock, in Hell Gate channel, work has been steadily prosecuted with a small force, the general plan pursued being similar to that adopted in the large submarine excavations at Hallet's point, so that in course of time the bed of the river will be dropped into the artificial chambers beneath by an explosion. Workmen are also engaged in removing fragments of rock from the old "crater," left by the grand explosion two years ago. The above is the substance of information obtained at Gen. Newton's office.

AN ENGINEERING FEAT.—Owing to the immense weight, the iron shoes in which rests two of the spans of the long Lehigh Valley railroad bridge at Easton, Pa., lately sank about an inch, throwing the bridge out of grade. As it was certain that the depression would continue, owing to the fact that the inside masonry of the pier is less solid than the outside, an iron casting 2 feet long, 3 feet 3 inches wide and 3 inches thick, weighing 7,000 pounds, was successfully placed under the span, in order to elevate them. The spans weigh 180 tons each. Hydraulic jacks were used. The spans were raised, the masonry redressed, the castings placed in position and the spans lowered without the stoppage of a single train. This is the greatest engineering feat that has been attempted and successfully carried through in this region.—*N. Y. Day Book.*

A DYNAMITE SHELL that can be projected against the hull of a ship, and insure its destruction or, at least, its serious damage, is affirmed to have received the favorable opinions of the Russian naval authorities, who, in view of the notoriously bad record of torpedo-boats during the late war, in attacking the war-ships of the Turks, and the great improvements that have been made of late years in devising effective modes of defense against this form of attack, have been engaged in devising some plan of employing explosive charges against hostile vessels. The invention of the dynamite shell above alluded to is said to have given them great satisfaction. A more detailed account of this novel weapon of offense appears in the Boston *Journal of Chemistry* for March.

A GREAT WORK.—Our citizens are scarcely aware of the progress which the Southern Pacific railroad is making toward forming a connection with railroads in the Mississippi valley. The Southern Pacific railroad is now actually completed for a distance of nearly 900 miles. It is 874 miles from San Francisco to Maricopa Wells, Arizona, and the road is already completed some miles east of that town. It is but 883 miles from San Francisco over the Central Pacific railroad to Salt Lake—Ogden. So the Southern Pacific railroad forms an outlet for San Francisco trade equal in length to the Central Pacific, a work which was considered a marvel a few years ago.

SPEED ON NARROW-GAUGE RAILROADS.—In a paper recently read by Graham Smith before the Liverpool Engineering Society, a statement frequently made that sufficiently high rates of speed cannot be got out of narrow-gauge roads is contradicted. Mr. Smith cites the Festiniog line in North Wales, where 35 miles an hour is not unknown, although the gauge is only one foot 11½ inches. Of course the lines must be properly laid out and constructed. In 1869 this line carried 9,700 passengers and 136,700 tons of goods, and was not worked up to full capacity.

GAS ENGINES.—The introduction of gas engines, says the *Engineer and Mining Journal*, has attained to remarkable dimensions in Germany and England (especially), where engines of this class as high as 30 to 50 horse-power have been built. Mr. Robert Grimshaw, reporting upon a recent visit to the Gasmotorenfabrik, Deutz, notices that a 50 horse-power gas engine, for a beet sugar factory, was in course of construction there. The gas companies, in view of the large consumption, furnish gas at very reduced rates for such engines.

BRIDGE MATHEMATICS.—To estimate what a bridge will cost any city if it is done by contract: Take the highest figures presented by any engineer and multiply them by the length of the bridge in inches, point off two places, and then add enough to prosecute any one who has anything to do with handling the funds, and the result is—that the bridge is an obstruction to navigation.—*Detroit Free Press.*

USEFUL INFORMATION.

Colored Pencils for Glass.

The following formulas for the composition of pencils for sketching on glass, porcelain, etc., are those used at the factory of A. W. Faber, of Stein, near Nurnberg, Germany:

1.—BLACK.

Lampblack	10 parts
White wax	40 parts
Tallow	10 parts

2.—WHITE.

Zinc white	40 parts
White wax	20 parts
Tallow	10 parts

3.—LIGHT BLUE.

Prussian blue	10 parts
White wax	20 parts
Tallow	10 parts

4.—DARK BLUE.

Prussian blue	15 parts
Gum Arabic	5 parts
Tallow	10 parts

5.—YELLOW.

Chrome yellow	10 parts
Wax	20 parts
Tallow	10 parts

The colors are mixed with the fats in warmed vessels, levigated with the same, and are then allowed to cool until they have acquired the proper consistency for being transferred to the presses. In these the mass is treated and shaped similarly as the graphite in the presses for ordinary pencils.

MILK AND ITS ENEMIES.—When one thinks of the foes which beset milk in its normal condition, it is a wonder it does not sooner fall from its high estate. It is indeed a substance which affords a most favorable foster ground for many growths which destroy its character and transform it from a thing of sweet nutrition to an offensive mass of decay. The cheese and butter maker, the milk seller and the milk drinker, are always in arms against a host of evils which threaten the material they employ and enjoy. Some idea can be gained of the variety of these evils from an interesting exhibition which was lately made at a German dairy fair by Prof. Ferdinand Cohn, of Breslau, and which consisted in drawings of the fungi which attack milk and its products. Descriptions of the exhibit enumerate: *Mucor racemosus*, the *Dictyostelium mucoroides*, the *Oidium lactis*, so common in sour milk, and the *Penicillium glaucum* or blue mold. A second group included the bacteria met within milk, among which were the *Bacterium termo;* the *Bacterium lacticum*, Cohn, the exciting cause of sourness of milk; the *Bacillus subtilis*, var. *butyricus*, or butyric acid bacterium, the cause of rancidness of butter; the *Vibrio synzanthus*, the bacterium of yellow milk; the *Micrococcus prodigiosus*, the bacterium of red milk; the *Bacterium syncyaneum;* the *Bacillus Anthracis* of Cohn; the *Micrococcus candidus*, and many others. "What countless evils do environ," etc. Is it any wonder that excellence in dairy products is only obtained at the cost of great skill and unceasing care?

IMPROVED MOLD FOR CASTING COPPER AND ITS ALLOYS.—It is customary in the use of molds in which brass or copper, or alloys of copper, are poured in a molten state, in order to produce cylinders or other articles, either hollow or solid, to cool them by the application of water, either by pouring it on the mold or placing the mold partly in water. Messrs. Waldenstrom & Summer of Manchester, propose to produce an improved mold for casting copper and its alloys by making the metal forming the mold hollow instead of being solid, as hitherto. Through the chambers or cavities thus made in the substance of the mold they cause water to circulate, and thus produce the cooling effect. In the present method of casting brass cylinders from which tubes are made much time and labor are expended in moving the mold for the purpose of cooling, preparing it for a fresh casting, and replacing it into a suitable position to receive the molten metal, but the improved system of cooling prevents this, the molds are rendered more durable, and better work is produced. By turning steam or warm water into the cavities in the substance of the mold they are enabled to warm the mold before commencing work, so as to get it quickly to a suitable temperature to produce a good casting.

GREEK BREAD.—The ancient Greeks used covered terra-cotta utensils, called *cribanoi*, which were pierced with holes in their circumference, and were the prototypes of the modern "Dutch ovens." After the dough was put in they were surrounded by burning coals, and the heat, penetrating by the holes, gave a more uniform temperature than an ordinary oven. After the reign of Pericles, Athens became renowned for the skill of its bakers and its cooks. They made 20 or more kinds of bread, some of which were very white and of excellent flavor. Plato reports that, a century before his time, a Sicilian baker, named Thearion, had made great improvements in his art. The Cappadocians made a very delicate bread, like Vienna rolls, by adding to the wheat flour a little milk, oil and salt.—*La Nature.*

SOLUBLE GLASS IN BRONZING.—Bottger varnishes objects of wood, porcelain, glass, or metal with soluble glass, and then shakes bronze powder over them.—*Dingler's Journal.*

TESTING IRON 60 YEARS OLD.—Two specimens of the old iron taken from the Belvidere bridge, recently demolished, have been tested by order of City Commissioner Tegmeyer. Specimen No. 1 (wrought iron), length 11 5-16 inches, was elongated to 12 9-16 inches and broke only at a strain equal to 52,836 pounds to the square inch. Specimen No. 2, length 10¾ inches, elongated to 12¼ inches, broke at a pressure of 61,880 pounds, equal to the best iron made at the present day. Another specimen was reduced ¾ inch and elongated from 9 to 9½ inches, and broke at a strain of 60,080 pounds. The bolts were placed in the bridge when it was built, 60 years ago. The tests were made by Mr. Wendell Bollman at his works.—*Baltimore Gazette, April 11th.*

CHLORIDE OF LIME AS AN INSECTICIDE.—*Le Cultivateur* remarks that rats, mice and insects will at once desert ground on which a little chloride of lime has been sprinkled. Plants may be protected from insect plagues by brushing their stems with a solution of it. It has often been noticed that a patch of land which has been treated in this way remains religiously respected by grubs, while the unprotected beds round about are literally devastated. Fruit trees may be guarded from the attacks of grubs by attaching to their trunks pieces of tow smeared with a mixture of chloride of lime and hog's lard, and ants and grubs already in possession will rapidly vacate their position.

ZINC.—It is surprising what an amount of zinc is consumed in the United States in the various industries into which it enters. Hundreds upon hundreds of tons are used for washboards, fruit-jar tops, platforms for stoves, fancy cornice works, candlesticks, trunk coverings, buttons, tacks, and many other uses, besides that which is converted into paint. Its uses are almost as varied as the uses of iron, and it is each day growing more and more into favor as it is better understood. Zinc will in time become a metal which will rank with iron in popularity, and will eventually supersede tin. Formerly nearly all the zinc used in this country by painters was obtained from abroad; but it is now furnished from our own mines.

THE FIRST LEAD PENCIL.—The statement that Eberhard Faber, the well-known lead pencil maker of New York, whose death occured recently, "built the first lead pencil factory ever known in America," is pronounced incorrect. William Monroe, of Concord, Mass., is said to have made the first lead pencil ever made in America, in 1811, and in a few years established an extensive manufactory of them, which he continued until his retirement from the business, in 1848. His pencils for many years were the best, and almost the only ones used in this country.

BLACK LACQUER FOR METAL AND WOOD.—Nine parts of shellac are dissolved in 50 parts of methylic alcohol and set aside for a few days. Then 10 parts of pulverized asphaltum are dissolved in 50 parts of coal tar benzine. Both liquids being mixed, a sufficient quantity of lamphlack is added to give it the required density. When necessary, it may be diluted with a mixture of alcohol and benzine.—*Chemiker Zeitung.*

GOOD HEALTH.

For Your Stomach's Sake.

Reader, do you recollect that you have a stomach? Or do you take no thought of your stomach and fill it up with anything which tastes good and comes handy? Or do you realize that the stomach manufactures strength for body and brain? Wouldn't you, were you certain that the eating of certain articles of food and the rejection of others make you, in two years, twice as strong, physically and mentally, as you are now; wouldn't you eat them? Because a clear head means cash. A muddled head means poverty. Brother, there's millions in eating the right stuff. Maybe you are more or less dyspeptic. Maybe you cram hot bread and fried ham into your stomach every morning for breakfast. Maybe you're pressed daily with business, neglect lunch and starve the stomach. Maybe all of us do. Maybe starved stomachs and eating food which tastes nicely but doesn't build up, recuperate or strengthen are the causes of our ills. Maybe we eat hearty meals and work like dray horses the moment we have finished. Maybe the man driving a good horse always allows him a half hour's rest after he has had his corn. Whoa! Maybe he doesn't allow that horse to eat after working until he's cooled off and his pulse is restful. Hey! Otherwise horse "founders."

Brethren, do we not founder betimes in that we take not so good care of ourselves as we do of our horses? Brethren, the greatness of a people depends on their intelligence! Intelligence depends much on a clear head; a clear head depends much on a sound stomach; a sound stomach may possibly be cultivated. It takes a live man to get along in the world; a half dead man lags far behind; a quarter dead man lags a little also. Brethren, some of us have weak stomachs left us as a legacy by our parents. Brethren and sisters, some of us now may be endowing weak stomachs on our offspring. Weak stomachs invite whisky, brandy or other stimulants. Will the ministers suspend their quarrels at the conference and depute one of their number to preach on this matter next Sunday? Hey!—*Daily Graphic.*

Unbolted Wheat-Meal Bread.

During the administration of William Pitt in England, there was a great scarcity of wheat, and in order to make it go as far as possible, Parliament passed a law that all the bread for the army should be made out of unbolted wheat-meal. History states that the result was such an improved condition among the soldiers as surprised them, and also their officers and surgeons. The latter declared that never before were the soldiers so healthy and robust, and that disease had nearly disappeared from the army. For a long time this kind of bread was used almost exclusively, but when wheat became abundant, its use was discontinued.

The use of unbolted wheat-meal bread has become greatly extended throughout the civilized world within the past generation, and every housewife should know how to make the very best article and have it constantly on the table. Children do much better upon it than upon bread made from fine flour.

In the State of Massachusetts they have normal schools where young men and women are educated for teachers at the public expense. In one of these schools, it is stated to us upon good authority, that the young ladies who come there to be educated are mostly from the rural districts, and that they are not well developed physically. Inquiry having been made into the cause of this, it has been found that these young women had not been well fed at home. They are brought up on hot biscuit and tea, and this does not supply sufficient nourishment to develop healthy bodies. The substitution of wheat-meal bread in all these cases would make a great difference in the physical development, health, longevity and usefulness of these persons.

CAUSE AND CURE OF SNORING.—A writer in the *Scientific Monthly* tells how the habit of snoring is acquired, and, better, how it may be cured: And, first, the cause: The air reaches the lungs through two channels, the nose and the mouth. The two currents meet in the throat just below the soft palate, the end of which hangs loose and swings backward and forward, producing the snoring. If the air reaches the lungs, as it should, through the nose, no noise will be made. If it reaches the same through the mouth, the palate will make more noise, since it is not the natural channel, but when it rushes through both these channels, then it is that the sound sleeper banishes rest from the pillows of his companions by his hideous noise. The remedy for snoring is to keep the mouth closed; and for this purpose Dr. Wyeth, the writer of the article referred to, has invented an article so cheap that anyone can make it, and no snorer should be without it. It consists of a single cap, fitting the head snugly, and a piece of soft material fitting the chin. These are connected by elastic webbing, which is connected with the head cap near the ears. This contrivance prevents the jaw from dropping down, and thereby renders snoring impossible. The great trouble will be to get people to adopt this invention, since the most upright and honest of men and women will rarely, if ever, confess that they snore, and will be very indignant if accused of it. As a further inducement to the introduction of this contrivance of Dr. Wyeth, it may be added that breathing through the mouth is very detrimental to the health, and that many diseases of the throat and lungs are contracted or aggravated thereby.

PERSONAL HEALTH AND COMFORT.—The following simple rules for preserving health and promoting personal comfort, if not new to some of our readers, are none the less important to every one. The object of brushing the teeth is to remove the destructive particles of food which, by their decomposition, generate decay. To neutralize the acid resulting from this chemical change is the object of dentifrices. A stiff brush should be used after every meal, and a thread of silk floss or india-rubber passed through between the teeth to remove particles of food. Rinsing the mouth in lime-water neutralizes the acid. A sun-bath is the most refreshing and life-giving bath that can possibly be taken. Always keep the feet warm, and thus avoid colds. To this end, never sit in damp shoes or wear foot-coverings fitting and pressing closely. The best time to eat fruit is half an hour before breakfast. A full bath should not be taken less than three hours after a meal. Never drink cold water before bathing. Do not take a cold bath when tired. Keep a box of powdered starch on the wash-stand; and, after washing, rub a pinch over the hands. It will prevent chapping. If feeling cold before going to bed, exercise; do not roast over a fire.

ANOTHER CURE FOR HYDROPHOBIA.—A German gamekeeper (W. Gassel), 82 years of age, states in the *Leipziger Zeitung:* "I do not wish to hurry with me my much-approved remedy against the bite of mad-dogs, but will make it publicly known; that is the last service I can render to the world. Take some warm wine vinegar and lukewarm water, wash the wound thoroughly, and dry it. Then pour a few drops of muriatic acid on the wound, because mineral acids destroy the poison of the saliva."—*Journal of Chemistry.*

The Week.

The Constitutional hlast has been fired and the echoes of the explosion are still ringing in our ears. The atmosphere is yet too emoky for the exact determination of its effectiveness, but as the majority of counties have heen heard from there can he little douht but that the new organic law has been adopted. The election passed off very quietly—a matter of congratulation, considering the intensity of interest and hitterness of partizanship displayed during the campaign. To-day the lassitude attendant upon excitement and over-strained exertion is plainly visihle in all the partics, and with all there is a sense of relief that the crisis has been passed and the matter settled.

In general the mining interests will go on as if there had heen no election. The Constitutional change does not alter the quantity or quality of the ores in our mines, nor yet does it lessen the desire for their products. There may he restrictions created iu some directions hy the new order of things, but theee will in the main he counterhalanced by the good derived in others. Above all things, work must not be allowed to flag. For, whether under old Constitution or uew Constitution, an honest and contented livelihood can only he attained hy earnest and pereistent effort. The idle are the despondent, the depeudent and the discontented ones, and honest lahor under any. law seldom fails to attain euccess.

The Future of the Comstock.

The signs point just now to increased animation in the mining stock market, particularly in the shares of certain Comstock mines, in the lower levels of which a good showing of mineral has lately heen ohtained. As exploration proceeds here the speculative feeling grows apace, confidence keeping fully ahreast if not a little in advance of ore developments. This is not business like, but it is the hahit of those who deal much in this sort of securities, and hence must be looked for. This ilk are a sanguine people, apt to largely discount the first favorahle indications met with at these great depths, a hatful of ore here ohtained sufficing sometimes to iuspire wide-spread enthusiasm and create a great upheaval of the market.

We took occasion not long since to counsel men of small means not to dahhle in these Comstock shares; a caution which it may not be amiss, in a season of danger like the present, to repeat. The Comstock mines have, in times past, yielded a large amount of bullion. A few of them have been worked with great profit, paying for a short time liberal dividends. But the ore from which this production was made lay at much less depths than the new finds on which these mines must depend for a renewal of their prosperity. The chances are against the finding of any more large and valuahle ore bodies along the Comstock range at depthe much under 2,000 feet. Should any of these mines come into or again return to honanza, it is flot prohahle that very large amounts of ore will he obtained above the 2200 or 2300-foot level. The cost of ore extraction in these mines increases in a sort of geometrical ratio with depth. This is not so much on account of the greater trouhle of raising the ore and water, as of the increased heat and difficulty of ventilation, already so formidahle that the work of exploration ou the present lower levels proceeds very slowly. With a depth of a few more hundred feet attained there is danger that downward operations will be arrested altogether. The temperature of the air iu these levels ranges from 130° to 140°, the water stauding at 154° Fahrenheit. At the rate of increase ohserved ahove the air at a depth of 3,000 feet will reach a temperature of 160° or 170°; an atmosphere in which men cannot eveu live, much less work, and which would therefore force an entire ahandonment of tho mines.

These are matters that should be taken into consideration hy persons disposed to traffic in Comstock shares. That they have not heen overlooked hy some who were in times past largely interested in these mines, may he inferred from the fact that these partiee have lately heen drawing out of the Comstock and investing in mining properties elsewhere. The further prospecting of the Comstock should he left to be prosecuted by men with abundant means, who can afford to take many chances of failure when coupled with one of large success. They can pay out without feeling it an amount of assessments that would greatly distress a poor man.

It would he just as perilous to huy these shares for a turn in the market ae for a permanent investment. The outlook for the Sierra Nevada is as favorable perhaps just now as for any mine on the Comstock. Yet a property that is capable of advancing its market price from a few hundred thousand dollars to sixty or seventy millions and receding to five millions, all within the epace of a year, leaving everyhody in doubt after this feat is performed which set of figures most nearly represents its actual value, must be a dangerous one to meddle with.

Shifting the Centers of Financial Supremacy.

Heretofore London and Paris, more especially the former, have been the great finaoial centers of the world. In all past time they have heen the great marts for gold and silver, fixing their prices and regulating the rate of exchange between all civilized peoples. To these cities money seeking investment and all surplus funds have gravitated, and to them capitalists desirous of effecting loans and nations in the market as horrowers have gone for accommodations. The principal means wherehy England has gained, and for so long a time heen enahled to maintain this financial supremacy, have consisted of her manufacturing industries and immense carrying capahilities, the outgrowths of the free trade policy for which she managed to procure such general acceptance.

At last this great financial center seems likely to he shifted from the old world to the new. The halance of trade, formerly against us, bas for several years past heen largely in our favor, our exports last year having exceeded our imports by more than $250,000,000, preventing that amount of money from heing sent ahroad. We are producing hullion within the limits of the United States at the rate of a hundred millions a year. The consequence is the flow of gold and silver out of the country has heen etoppcd; credits are in our favor, and it looks as if exchange would before long he everywhere quoted on New York instead of London. Of these cities New York is, hoth hy reason of her geographical pceition and her industrial relations, the most central to the leading commercial nations of the eartb. Then, too, she has the advantage of greater proximity to the large gold and silver-producing regions of the present day, while our transcontinental railroads have brought her nearer to the Orient than is her British rival. We are a growing while England is a declining power, rendering such a transfer as is here alluded to altogether natural and prohahle.

While New York, taking up the reins that Brittania must drop, shall so grow and rule on the Atlantic, San Fraucisco will reach an early and great supremacy on the Pacific side of the continent. In the agricultural and mineral wealth of the coast and her far out-reaching trade her future is assured. While she continues as at present a great ore mart and supply point for the mining regious west of and adjacent to the Rocky mountains, her manufactures, more especially of mining machinery, must rapidly increase. From western Mexico and Central America on the south, and from British Columhia and Alaska on the north, these demands will hereafter multiply at an amazing rate, the extension of railroads into the interior rendering tribntary to her iuterests meantime new domains in that direction. San Francisco sits with New York, London, Paris and Hongkong in the zone that most controls the material interests of mankind, and may justly aspire to share with them this eovereign power. Besides enjoying all their natural advantages, she finde in her mines, her situation and surroundings resources peculiar to herself, and which must soon insure to her the financial consequence now pertaining to these other metropolitan towns. The present halt in her progress ie but the stopping of the strong man to girt up his loins for a fresh etart. San Francisco is young, unhurdened with debt and environed with innumerahle sources of virgin wealth. Her recuperative energies are of the irrepressible kind, and when she makes again a forward move, her advancement will he rapid, healthful aud permanent. Relatively her progress will he greater than that of New York or any of the large cities of the old world. Indeed, we know not where to look for the city that will keep pace with her, once she resumes her onward march; and this we may venture to predict, that whatever she may gain will not afterwards be lost. There may come a lull in her growth but no general decay till there shall be no more need for great cities on the face of our glohe.

Opening Up a New Mining Region.

Tho whole of northeastern Nevada ahounds with irregular mountain ranges alternating with broad valleye and harren plains, portions of which during the wet season are converted into shallow lakes. It is a dry, sterile and every way forhidding region, worth hut little for either grazing or farming purposes. There is, however, a small amount of good agricultural land in eome of the valleys, and upon which fair crops of grain and vegetablee could he raised with irrigation. There is everywhere bunch grass, the growth on the plains heing scattered and scant, but quite abundaut on the mountains, where also there is good water and some timber.

The mountains in this region were explored for the precious metals at an early day, prospecting parties having visited it even hefore the Washoe mines were discovered. It was in 1858 that Peter Lassen, the pioneer, was killed hy the Indians while out there on an errand of this kind. Two years later a large party from Virginia City visited and thoroughly examined this remote corner of the State, and finding good signs of mineral, organized a mining district named Puehlo, took up claims and done some work on them. Shortly after quite a large population gathered there, some of which settled on the land while others engaged in mining. A town was huilt, a sawmill put up and several hundred acres of land enclosed and cultivated. While this colony was so progressing the Indians became hostile, and attacking, killed some of the settlers and drove the rest out of the country, their houses, mill and other improvements haviug heen giving to the flames.

From that time until recently not much was done towards prospecting the mines or occupying the lands in that region. It appears from the Nevada papers that a party of miners has lately gone in there and re-locating the old claims, organized a new district, calling it Disaster Peak, this name having reference to the misfortunes that hefel the first set of colonists. The mines give good evidence of heing valuahle, and as there are no longer any Indians to deter prospectore the whole country will no doubt he thoroughly explored and its value for mining purposes be determined.

REVOLVING CYLINDER FURNACES.—As will will he seen from an advertisement in another column, Messrs. Rankin, Brayton & Co., of the Pacific Iron Works, are now enahled to give purchasere the licenses of *all* patent claimants in revolving cylinder furnaces, to wit: White, Howell, Thompson and the Stedefeldt Furnace Co. This will avoid all further litigation in reference to these rival claims.

THE late warm weather has caueed the snow on the Sierra Nevada to melt pretty rapidly. As a consequence the water in the mountain streams is reaching a high stage.

The Great Australian Exhibition.

We made a notice some weeks ago of the grand International exhibition which will be held at Sydney in September next. As this affords an opportunity for the display of California productions and manufactures in a part of the world where it is greatly to our advantage to huild up trade and commercial amity, we deem it timely to make farther allusion to the suhject. We had a conversation on Tuesday with Rev. Dr. John I. Bleasdale, who is acting under authority of the managers of the exhihition as their representative on this coast. He reccived the approval of the Supervisors of the city and county of San Francisco, and has heen given rooms in the New City Hall on Market street, where all interested in the coming display at Sydncy may call upon or address him. The Supervisors expressed their interest in the exhibition in these words: "There exists hetween the State of California and the Australian colonies the most iutimate commercial relations, the fostering of which should he our especial aim. Therefore thie board, heartily sympathizing with the projected International exhihition at Sydney, and desiring ite complete succese, earnestly recommends the mechanical, agricultural, commercial and other interests of this city and State to contribute thereto the products of their various industries."

Securing thie approval, Dr. Bleasdale addressed a letter to his Excellency Governor Irwin, setting forth the aims of the exhihition. Governor Irwin replied in the following words: "I am in the fulleet sympathy with the objects of the International exhibition to he held at Sydney, N. S. Wales, in Septemher, and most cordially recommend to the enterprising citizens of the State to do what they can to have a creditahle representation of the products of the State and its industries at the said exhihition."

Thus the movement to give ourState a representation at Sydney has received official recognition, hut it remaine wholly with individual producers and manufacturers to give the matter a taugihle form iu the shape of material for exhihition. It is true that the exhihition of our good things will occasion the pro-ducers or manufacturers some outlay for freights, hut it is promised that concessions will he made hy carryingcompanies. The different classes of objects which are desired for exhibition are outlined hy the acting commission in this city, as follows: "1. A compilation of statistics, relating to the population, social condition, commercial and indnstrial state of your city, town, shire or district. 2. Photographs of the most notable puhlic and other huildings in and around your city or town, and of the most agreeahle scenery in the neighborhood, or of various parts of yonr district, and in the case of gold fields, of some of the principal mines. The photographs should be of uniform size, 12 hy 10 inches heing preferred. 3. Exhihits illustrating the perfection to which the cultivation of grain and wool-growing has been brought in your district. 4. The cultivation of the vine and the olive, and their products. 5. The extraction of the precions metals. 6. The several industrial manufactures estahlisbed, with samples of their production. 7. Any raw product which may have a value for indnetrial purposes."

Dr. Bleasdale informs us that he is receiving quite a list of applications for space from our city merchants and manufacturers, and if the time were greater, douhtless quite a representative display could be had. Whatever is done must, however, he done quickly, and any of our readere in the interior who are disposed to contribute to the California exhihit, should not delay in declaring their intention.

It may he announced thue early that next year there will be held a grand International exhihition at Melhourne, Victoria, which Dr. Bleasdale will represent during his stay on this coast. This exhibition will be on even a larger scale than that held this summer at Sydney. The U. S. Government has already appointed commissioners to act for the Melhonrne exhihition, and it is fair to presume that our country will he fully represented.

ERUPTIONS IN THE HAWAIIAN ISLANDS.—In the latter portion of March last, the volcano of Kilauea was sending forth a lava flow of nnnsual volume, which is described hy the Hawaiian *Gazette* as follows: "There was a large lava flow just to leeward of the orater. A river of running lava of ahout a mile and a quarter long hy three-quarters of a mile wide. Looking towards it, it was a grand sight. The lava seemed to run to sea at the rate of about half a mile an hour. There is scarcely any fire in any part of the crater, except where the lava is flowing from, and it is still running. If it runs much longer there will he danger. There was some fire on the top of Maunaloa two weeks ago, and all the people in Kau expect a lava flow down there sooner or later. Tbey had a shock of earthquake at Kau ahout a week ago, and the people there are keeping a sharp lookout for what may come." From the foregoing, it would seem there are apprehensions of stirring times in the neighhorhood of the crater of Kilauea and Maunaloa, and we would not he surprised to learn at any moment of volcanic action of unusual violence. It is some yeare since there was any great out-pouring at Kilauea and Mannaloa, and it is hut natural that there should he a demonstration of nature at intervals, as heretofore. These things are looked for hy the natives, and eeeme to occasion no alarm.

American Gauging and Measuring Implements.—No. 1.

Accurate measurement lies at the fonndation nf all mechanical success. The workmen who carelessly applies his standard gauge knows that mnch dsponds npon the perfect identity in size which he arranges hetween the work in hand and the standard furnished him, but he seldom thinks of the tirelsss effort which has been undertaken to establish a standard. Until recently this work has mainly been entrusted to foreign mechanics, hut it is a theme for congratulation that Americans have now entered the lists with them and havs devised appliances for measurement which are unsurpassod for accuracy.

Our mechanical progresa in this direction was lately shown in a paper rend in February last before ths Franklin Iustitutc, of Philadelphia, by J. Richards, a member of the firm of Richards, Hand & Taylor proprietors of the American Standard Gauge and Tool Works, of Philadelphia, Pa. From this paper of Mr. Richards we shall take points of description and illustration which will shcw, at least in part, the achievements of Americans in tho linee we have intimated.

It is well known to everyone connected with engineering mannfactures, that the maintonance of nniform or atandard dimensions in machine fitting, ia fast becoming a rule and almost a necessity, enhancing the value of what is made, and at the same time cheapening the coat of production hy permitting a moro extended division of labor. The division of lahor in machine fitting, as in nearly all hranches of industry, depends on what may he called duplication, that is, producing one thing like another, so that different workmen may, independent of each other, prepare parts or pieces which can he assembled and put together without trying and hand fitting.

The export of American-made machines to Enrope, commencod, we may claim, hecause of an early and auccessful application of the gauging syatem. One of the first and most important orders received from Europe for machinery, was for a nearly complete equipment of implements for the Enfield small-arms factory, in England; machines and tools the maiu object of which was a duplication of their product. Watches, clocks, sewing machines, emall arms, with many other articles of a similar kind, are now made in this country and sold in Europe, hecause the system of gauging and duplicating offere an advantage ovsrhalancing cheaper lahor, cheaper material and more than 3,000 miles of ocean oarriage.

Referring now to machino shop gauges, it is well-known that most of our larger establishments have been supplied with atandard gauges imported from England, usually a set of pins and collars snch are shown in Fig. 1, and corresponding to what ia called the Whitworth standard. Most of these gauges are made in the works of the Whitworth company at Manchester, who hy long experience and their reputation for good work, have controlled this manufacture. Of late years, however, some fine examples have been made in this country, but at prices much greater than are demauded for English gauges.

Pins and collara—or cylindrical gauges as they are generally called—were, so far as we have any record, first made hy the celebrated John G. Bodmer, of Manchester, a Swiss engineer whn may he regarded as the compeor of Sir Joseph Whitworth, in machine tool improvement. For 30 years or more these pins and collars have been made with great exactness, the fitting snrfaces highly polished and in every respect a marvel of exactnese and uniformity.

In 1860 the writer, while engaged as a manager in the Ohio Tool Compauy Worke, at Columhus, Ohio, feeling the want of aome means of maintaining aizes and not having aufficient use for suoh implements to justify the purchase of a eet of pina and collars, conceived the idea of introducing eome cheaper syetem, hy which fixed calipers with some simple meana to keep them in adjustment, would take the place of pins and collars. The matter was followed up and calipers of several kinda were made, aleo a corrective gauge not differing much from the nne shown in Fig. 2.

A prevalent opinion exists that the British and Amerioan etaudards for lineal measure are not the same. This idea, I hav e heen informed hy Mr. John W. Nystrom, came from publications of the Smithsonian Institution, hut a moment's reflection must show how improhable it is that there is auy difference in the lineal measures used. The British standard is an arhitrary one, fixed after several years of lahor on the part of a learned commission and at considerahle expense. The pendulum test, which was the only natural one hy which experiments were made, was abandoned after thousands of readings ahowed its inconstancy. The French meter of the forty-millionth part of the earth's meridian, as well as all other natural atandards, were abandoned for the same reason, and the wisdom of this course has heen proved hy the French government siuce adopting an arhitrary etandard the eame as the English had done.

In thie country, while there has heen more spent in preparing comparative standards than by any other government in the world, there has heen no search, eo far as I know, after natural or other atandards. The equipment of implementa of transmission and for measnring, exceeds that of which any nther country can boast, hut ths principal wisdom shown in the matter, has heen in avoiding the useless expense of fixing an independent standard which might be anything.

By comparison, nnder similar conditions, a metal test rod adjusted at Washington and a similar one adjusted at London would show a difference due to ten degrees of temperature, and this is, no douht, tho only differenca. It is enough to know that gauges made to a carefully adjusted standard here will match and interchange with those made iu Englaud.

Proceeding, now, to notice more particularly the measuring machine shown iuside elevation at Fig. 3: It cohsists of a strong frame, ou the top of which are two traversing slides very carefully fitted and moved by screws. Ths contact points seen at the center are of hardened steel made parallel hy careful fitting. Ths idex wheels at each end are to count the revolntions of the screws or divisions of the samo. One of the screws has a pitch of eight threads to an inch for the ordinary divisions marked on rules and scales, and the other scraw is ten per inch for decimal divisioue.

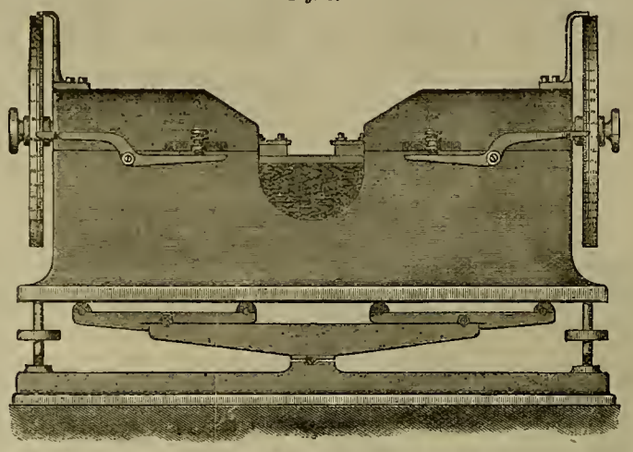
In measnring, the points are brought togother in easy contact to form a hase or starting point and then expanded hy turning one or the other of the wheels, or both, counting the revolutions or parts of revolutions to determine the distance between the points or the size of what is to he measured. On one aide the nnmher of diviaione is 1,000, hence with a screw of 10 threada to an inch, each division on the wheel equala 1-10,000th of an inch at the points.

The movahle indices on the front of the machine are to correct the imperfections of the screws on a principle which, so far as is known, was invented hy Prof. John E. Sweet, of Cornell University.

The two sot screws seen in front and resting against the upper surface of the index hars are attached to and move with the slidos of the machine, and the ehape of the surface on which these acrews slide may he called a diagram of the screw's imperfections. In the drawing, straight lines are shown, hut practically the lines are neither straight nor regular. The wooden throat piece sesn helow the points is removed when large pieces are to he put in the machine.

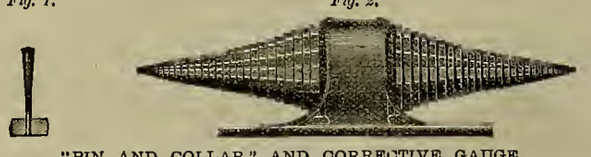
The machine is shown mounted on halance bars, which aeem superfluous with so strong a frame; nevertheless, hy setting up the screws heneath the ends of the frame, a very appareut change in the readings will bs seen.

Fig. 3.



AMERICAN STANDARD GAUGE AND TOOL WORKS' MEASURING MACHINE.

Fig. 1. *Fig. 2.*



"PIN AND COLLAR" AND CORRECTIVE GAUGE.

Another Smelting Process.—A series of experiments in ore smelting has heen in progress at Sacramento under a process patented by John A. Robertson. The furnace employed in making theee tests is a reverheratory, 28 feet in length, with capacity to reduce one ton per hour. The ore after roasting is dropped into a solution composed of sulphate of copper, cyanide of potassium and salt, and an additional ingredient, which constitutes the eecret of the patent, and which causes the ore when removed from the solution to crumhle readily, leaving the sulphurets pure. The ore is then ground and amalgamated, run into a settler and washed. The entire cost of treatment hy this method is said not to exceed four or five dollars per ton; the furnace nnd other necessary apparatus costing $1,600. The final results of this series of experiments will soon he given to the puhlic.

The steamer *Richmond* lately landed 758 emigrants in New York.

The Coleman Sluice—A Machine for Saving Fine Gold.

Our gold miners, both quartz and placer, are greatly in want of a machine or method whershy a larger percentage of tho excessively fiue particles of metal contained in the aurifsrous earths and orcs now being handled by them, can be saved. Of these gold-bearing stnffs that we attsmpt to work, competent judges are of ths opiuion that we now lose very nearly one-third of the total amouut of precious metal they carry, this heavy proportion making uot merely a temporary escaps, but being irretrisvahly lost. In view of a waste so large and complete, any mode or devico that promises to much dimiuish the same, claims special attsntion.

The importancc of effecting oven a emall gain in this respect finds apt illustration iu ths case nf the Suske River mines, where a largo numher of mon are likely to find steady and profitable employmcnt for many years through the introduction of silver-coated copper plates, which aerve to catch and retaiu much of the fiue gold that had escaped the apparatus hefore in use. A description of these plates and the manner of adjusting them in the sluices having been given in some comments on theso Suake River placers made hy us several wceka siuce, need not now he ropeated.

In further experimcnting with these machines, it has occurred to some of the miners on Suake river that their efficiency might he increased hy so corrugating the hottoms of their sluices that they could he converted iuto a serisa of quicksilver vats; one of the miners having written to the Press inquiring whether this idea has ever heen practically carried out, and if so, whether or not the arrangemeut is protected hy patent. To these inquiries we are prepared to give an affirmative answer. In July, 1869, Ezra Coleman, a resident of Sau Francisco, applied for and through the Mining and Scientific Press Patent Agency secured letters pateut for an invention of this kind. The bottom of the Coleman sluice, made of sheet copper or other metal, is formed into indentations, circular or triangular, running transversely across it After the sluice has heen set at the proper angle, these depressions are filled not quite full of quicksilver, thus forming an almoat continuous sheet of this metal, over which the water and gravel or the pulp passes. The hottom of this sluice may ho, and for the sake of giving it greater efficiency should he, coated with eilver, although this feature is not patented. As an appendage to this machine there is affixed at the lower end of it a copper plate, silver coated on the nuder side, for catching the float gold. This plate, which moves in grooves in the sides of the sluice, is placed at a low angle, and so nearly closed at its lower end that the space hetweeu it and the hottom of the sluice is kept filled with water, whereby the float gold is brought iu contact with the under side of the plate which catches and holds it.

One of these sluices can he seen in operation at Hendy's machine shop, corner of Fremont and Mission streets, in this city, where it performs its duties with a commendahle, not to say astonishing, efficiency. It is heing run on sand from Gold Bluff and our various auriferous ocean heaches; material from which it has heen found impossihle to extract more than a small proportion of the gold it contained hy any working processs yet invented. This machine it is claimed will save every particle of precions metal, even to the minutest atom of float gold; the latter heing caught hy the inclined plate at the lower end of the sluice. Even gold leaf thrown in above is here arrested without having suffered appreciahle loss, and a more erucial test than thia could hardly he instituted. It is claimed that this is the only machine in which any special, or at least effectivs, provision has been made for seiziug and detaining the float gold; an end that is here compassed hy applying the arrssting surfsce ou the top of the water where these light atoms swim, instead of placing it below where very few of them can be reached, as has heretofore heen practiced. This, though of secondary importance, is still a valuable feature of ths Coleman invention. Attached to this slnice is a quicksilver box, and at its lower extremity a trough furnished with a rsal aud an adjustahle false bottom, hy the shifting of which latter the trough can be made desp or shallow, as required. This trough, which can he multiplied to any extent necessary, is desigued for saving sulphurets, and will therefore he used chiefly iu quartz mills.

In operating this machine, the most of the gold is fonnd in the upper two or three riffles, so effectually do the latter perform their work. The water and gravel, as they traverso the sluice, plunge into the mass of quicksilver resting in the transverse depressions along ita bottom and striko the lower aide of the riffle. Reacting, they are forced again through the quicksilvor aud made to impiuge against the upper side of the riffle, where the gold that has escaped amalgamation is captured and retained, this constant agitation of the quicksilver keepiug it lively and in coudition for active aervice.

The iuventor states that expericnce proves this to he the best implement for saving microscopic gold yet invented, and in view of the large quantities of thia material to be operated upou, prnvided it can he handled successfully, its prospective importance cau hardly he over-rated. For washing the auriferous heach sands, which have heretofore hafflled almost every endeavor directed to their profitable treatment, this sluice appears to he especially well adapted. These sands, after heing passed through it, are so completelv divested of their gold that scarcely a trace of that metal can, hy fire assay, be detected in the tailings. Should the machine, on more extended trials, show itself well suited for this field of operatious, it will afford remunerative employment to thousands of men and greatly enlarge the gold product of both California and Oregon, for these heaches reach far north into the latter State. Recently rich sand of this kind has heen discovered on the hay shore at Santa Cruz, hut the gold is so infinitesimally fine that only the smallest wages can he made at washing it. Even the sand found last fall south of the "Golden Gate" contains a fair quantity of gold, hut for the same reason nothing could he done with it. Within the past few weeks the discovery of placer digginge is announced in Santa Barhara, and in other counties to the south; hut nearly everywhere the same trouhle presents itself, rendering these finds of little avail. With the aid of the Coleman sluice it is altogether likely that moderate and perhaps large wages could he earned at every one of these localities, except that lying to the westward of the city. Even on Snake river the earuings of the miners might, through its use, he materially increased. We cannot, in fact, see why it could not he employed to advantage in hydraulic and every other branch of placer operations, as well also as for saving the fine gold and the sulphurets in quartz mills.

The inventor of this implement is ready to treat with parties desirous of using it, on easy and liheral terms; the reason that he has not sooner sought to introduce it to the attention of the mining puhlic heing that he was, immediately after takiug out letters patent, appointed Superintendent of a mine on the Comstock, which position he continued to hold until a short time since. He is now prepared to hnild, at the machine shop mentioned, as many of these sluices as he may have orders for, and to sell the right to its use to such as may require it.

Quicksilver Movements.

The market for quicksilver, under unabated production and coutinued low prices, remains sluggish. The combination long talked of, and at one time deemed imminent, fails of final consummation, leaving to the mine owner hut a scanty profit. Heavy shipments of this metal were made to China last month, hut whether to meet consumptive demands or to find its way hack to this port, as considerahle quantities have done, is not quite apparent, prohably the latter, as that market has never heen without full stocks. Quicksilver has in fact heeu used for some time past instead of exchange on that couutry. As a consequence this metal has accumulated there to an extent that has rendered its re-shipmcnt to this market profitahle; some 8,000 flasks having, it is said, heen imported within the last few months from Hong Kong. The charges attending the delivery of quicksilver in thnt port are less than one cent per pound; for the round trip not more than one and three-quarters cents per pound, hardly greater than would attend the carriage of silver hars or coin. The quantity of this metal shipped from San Francisco hy sea during the first four months of the present year amounts to 18.389 flasks, valued at $561,618, against 7,923 flaska, valued at $267,449, during a like period last year. Of the shipments made so far this year, 13,320 flasks went to China, and 3,694 to Mexico; Japan, Peru and Australia taking from 300 to 500 flasks each. and Central Americn a much less quantity. China has taken more thau five times as much and Mexico nearly twice as much quicksilver this year as last, and there ie no douht hut the consumption in the latter country will increase rapidly in the future,

CAUTION

To Hydraulic Miners.

The public generally and Hydraulic Miners especially are hereby notified that any parties making or using the contrivance known as the HOSKIN DEFLECTOR will be prosecuted to the full extent of the law, said machine having been declared by the U. S. Circuit Court an infringement upon my patent, the

Bloomfield Deflecting Nozzle.

The public are also cautioned against using the Hoskin Deflector because of its danger to life and limb, this device having already occasioned several deaths and other serious accidents. The BLOOMFIELD DEFLECTOR is entirely safe, its two and a half years use without accident, as well as its construction, proves it to be a reliable contrivance.

Any parties wishing to purchase the right to use these Deflectors can do so by applying to the undersigned,

HENRY C. PERKINS,

North Bloomfield, Nevada Co., Cal., October 1st, 1878.

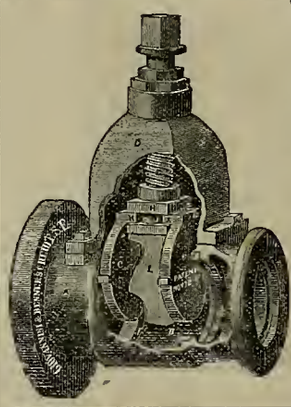
Union Brass Foundry and Mechanical Work Shop.



GIOVANNINI & CO.,

417 and 419 Mission Street, - - SAN FRANCISCO.

The attention of our customers and especially of those interested in Water Works, Gas Works or Mines is respectfully called to our very important Improvement in the construction of Stop Valves (or Gates). They differ from all others in that the inner faces are perfectly parallel, therefore when the Gate or Valve is to be opened, at the first movement of the screw the center block (see cut) releases the disks from their bearings, so that they will move easily and prevent the wearing of the inner faces.

This Gate has proved very efficient in Pipes of all sizes, and under any pressure and from its double form and perfect joint formation is especially valuable for use in large Pipes for water, steam and gas, and from its avoidance of any wedge shape cannot jam at any point (see cut).

The **G. & B. Valves** (or Gates) have no equal in simplicity of construction of all working parts, ease of access for repairs, and durability.

We have recently enlarged and fitted up our Brass Foundry and Shop with all the latest improved Tools and Machinery, thus greatly increasing our facilities for rapidly executing orders for all sizes of Stop Valves (or Gates) from three-inch to four feet in diameter, or any size, to order. We guarantee them to give better satisfaction, cost less money, and last longer than any other Valve in use.

We are also prepared to execute all orders in Brass Work for Breweries, Distilleries, Plumbers, Gas and Mining Apparatus, Ship Work, Soda Apparatus, Steam Fittings, Meters, Gauges and Indicators. Also in Machine Pattern and Model Making, and Clock Work. Gear cut to order. Brass Castings of all kinds. We are confident of our ability, and all orders entrusted to us will be executed with promptness and dispatch.

GIOVANNINI & CO., 417 & 419 Mission St, S. F.

SAVE YOUR GOLD!

Highly Important to Miners and Quartz Mill Men!

SILVER PLATED AMALGAMATING PLATES.

The best process yet discovered for saving fine or float gold. Extensively used with great success in gravel and placer mining in various parts of the Pacific Coast. Over five hundred orders have been filled, and the demand is constantly increasing. A large number of these Plates were sent to Snake River mines, Idaho, last year, and a great many orders are being filled for them this season. Circulars containing full instructions for working these Plates sent with each order. Old Mining Plates bought or taken in exchange for new Silver Plated Plates, and full value allowed. Gold extracted from old Plates at a moderate cost by a new and economical process. Old Plates (which often contain a surplus of gold above the cost of plating) can be re-plated.

With the most extensive facilities on the Pacific Coast, orders can be filled very promptly and satisfaction guaranteed.

Mining Men and the public generally are cautioned against unprincipled and irresponsible parties traveling through the country, endeavoring to secure orders for very inferior qualities of Silver Plated Mining Plates.

Barlow J. Smith. M.D.

Consulting Physician,

Professor of Phrenology and Mental Hygiene.

Proprietor of the Smithsonian Medical and Phrenological Institute, 635 California Street, above Kearny.

This Institute, by combining medical hygiene with the various Water Cure treatments and the most powerful Electrized Horseshoe Magnet in the world, claims to cure speedily and permanently all forms of acute or chronic nervous debilitations, Brain, Spinal and Heart diseases, St. Vitus Dance, Palsy, Epilepsy and all Rheumatic, Liver and Kidney troubles. The institution has for the past 20 years made a specialty of treating all forms of weaknesses and diseases peculiar to males and females. By the use of hygienic remedies and electro-motopathy the worst forms of impotency and seminal weakness in males and sterility in females are speedily and permanently overcome. Hygienic board, with or without rooms. Terms moderate. Electro-thermal, Russo-Turkish and Medicated Baths given daily.

Mrs. Dr. Smith as Matron has charge of the female bathing department.

DR. SMITH has practiced Phrenology the past 30 years, and during the last 20 years has been constantly using the science connected with Physiognomy, in examining or diagnosing disease in this city, and claims to have made discoveries in the SCIENCE of Phrenology that enables him, by an examination of the head, even blindfolded, to determine the disease to which the person is constitutionally subject, or whether the disease at the time afflicting the person, is the result of accident or hereditary weakness; whether CONSUMPTIVE, DYSPEPTIC, RHEUMATIC, APOPLECTIC, NEURALGIC, LEUCORRHŒAL, or SEMINAL. Especially does the form of the head indicate the strength of the uterine, genital or reproductive system. The head is also an index of the natural strength of the lungs, heart, stomach, liver, kidneys, spleen, back or vertebra, and it determines the power of the system in warding off and overcoming disease of all kinds.

Ladies or gentlemen, desirous of obtaining a thorough and correct Phrenological examinations with Fowler and Wells' charts, will meet with a respectful reception at his consulting rooms. Parties can depend upon a reliable delineation of the character of their intimate male or female friends, by presenting a clearly defined photograph.

Phrenological or Physiognomical examinations without charts, $1.50; with charts, from $2 to $3.

INVITATION TO INVALIDS

And all persons who are in any way out of health, who desire to know the nature and causes of their disease, may avail themselves of an examination through phrenology in regard to health free of charge, between the hours of 9 A. M. and 8 P. M. Sundays from 9 A. M. to 12 M.

WANTED—$10,000.

For $10,000 cash in hand I will give a one-half interest in the BLUE JAY and ELEPHANT QUARTZ mines, situated in the French Creek Mining District, Siskiyou County, Cal. And I will take or give a lease on said mines, and pay or receive eight per cent. on the amount invested. For further particulars apply to H. C. Cory, Etna Mills, Siskiyou County, California.

P. O Address: ALAMEDA, CAL.

PACIFIC POWER CO.

Room with steam power to let in the Pacific Power Co.'s new brick building, Stevenson street, near Market. Elevator in building. Apply at the Company's office, 202 Sansome St., room 7.

RARE CHANCE.

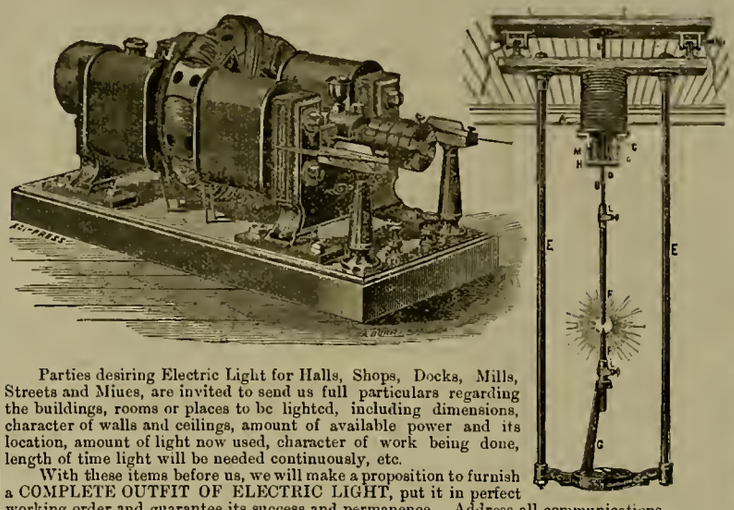
For sale or to lease, a two-thirds interest in a good paying country newspaper. Address "Liberal," this office

ELECTRIC LIGHT.

BRUSH PATENT.

The Best, Cheapest, Cleanest, and Most Powerful Light in the World.

In daily use at the Palace Hotel and the Union Iron Works, S. F.



Parties desiring Electric Light for Halls, Shops, Docks, Mills, Streets and Mines, are invited to send us full particulars regarding the buildings, rooms or places to be lighted, including dimensions, character of walls and ceilings, amount of available power and its location, amount of light now used, character of work being done, length of time light will be needed continuously, etc.

With these items before us, we will make a proposition to furnish a COMPLETE OUTFIT OF ELECTRIC LIGHT, put it in perfect working order and guarantee its success and permanence. Address all communications,

S. F. TELEGRAPH SUPPLY CO.,
WM. KERR, President,
San Francisco, Cal.

Ingersoll Rock Drills.

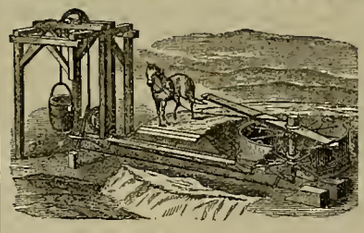
In use in the largest and best Mines of the Coast.

HAS AUTOMATIC FEED.

Has less Repairs.

Is Lighter and more Easily Adjusted than any other Drill.

Our DRY AIR COMPRESSORS are the most Economical Compressors in the Market.



MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.

The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

REYNOLDS, RIX & CO., 18 & 20 Fremont St., San Francisco.

GOLD, SILVER AND COPPER MINING, Reducing and Concentration Machinery.

Hoisting Engines, Diamond Pointed Rock Drills, Manufactured by M. C. BULLOCK.

Address, FRASER, CHALMERS & CO., Chicago, Ill.

Notions about California.

It is passing strange what notions about California are promulgated hy those who ought to know better. Persons who pass a brief sojourn here, dnring which they have perhaps been wholly engaged in some special line of thought and work, go away from us and are impelled to hetake to themselves wide experiencs and general viswe concerning California conditions, to which psrhaps they scarcely gave a moment's thought while they wers yet with us. Tbis is the most charitable view to take of the statsments of these people, and charity is a good thing to cherish even toward the most mistaken of the human kind. The New York *Tribune* has found one of these philosophical critics in the person of "an Easteru journalist who has returned from California after three years' experience of newspaper work in San Francisco." We are sorry this person did not cling to observations concerning his individual life here, becauss he fails utterly when he undertakes generalizations. For example, what stupid nousense this is, as applied to the people of California generally: "The people care very little ahout what goes on in the East. Their attachnient to the Union is not strong. If there should ever arise a second secession movement it will not be in ths South, but in California. One often heare talk of a Pacific Coast republic." This is eimply a hase slander upon the people of California.

Upon the subject of lands and agriculture in this State this person's viewe are a most curious medley of truth and nonsense. They are described as followe:

> There is much complaint of the ignorance and carelessness of Congress with regard to tbe interests of the coast. The land legislation, for example, is all adapted to a region of vcrdure, and is consequently not at all adapted to an arid, sage-brush region where agriculture depends on irrigation. There is not much inducement for emigration to California, and none at all for men to go without capital. The policy of the great landowners is to discourage immigration. Their plan has been to divide society into two classes, wealthy proprietors and a proletariat. I am glad to see that a few landowners are taking a new course and dividing their immense estates into small tracts. California would support double or treble her present rural population, but the land system must be radically changed and the facilities for irrigation developed and utilized. Pretty much all the land tbat can be profitably cultivated without irrigation is already occupied.

This is a fine example of generalizing from half-truths. It is true that the land legislation does not wholly apply to a State which presents such wide extremee in natural conditions as prevail in this State, but the area to which it ie inapplicable is small compared with that which it suits very well. But the conclusion which this authority reaches is not strange when it is seen that he looks upon California as "an arid, sage-brush region, where agriculture depends upon irrigatiou." Thoss great districts of our State where the rainfall is apt to he excessive and crops often suffer therehy, will have their own opinion of a critic who classes them "arid" and a "sage-brush region," and prescribes irrigation for their drenched fields. There is, it is true, need of eome system which will hring irrigation to the parts which need it, and some modifications, as for example in the timher-culture act in the dry valleys, might be made to the advantage of settlers, but these, though important, are not sweeping in their character.

The statement that "large landholdere discourage immigration" is a queer commentary on the tireless efforts which have been made by these large landowners, to fill the world with reports of the possibilities of their lands—efforts which have at timee been over-zealous and have suppressed the conditions requisite to success. That these men as a rule are anxioue to populate their lands is seen in the many colony enterprises which they have promoted and which are now projected in large numhers. This writer puts his limitation in the wrong place. It is the many not the few who are dividing their estates and, with occasional exceptions, the few would he glad to divide if the demand warranted ths division. It is true that there is little inducement to come here to those who have no money to start with, hut it is not because thers is not land enough to huy, hut hecause they could not buy an acre if the world were at auction. It is true that irrigation would open many areas for settlement in small tracts, hut it is not true that there is lack of land on this account. It is true that there is room in California for douhle or treble her present rural population, and it is also true that tbe disposition to change the "land system" is progressing more rapidly than the chance to make the change is developing. There are other statements in the quotations which we make ahove which are not true in the sense they are presented, hut we have said enough to put our Eastern readers on their guard against all such generalizations, and that is all we have space to do at this time.

THE famous run between Chicago and Council Bluffs of Jarrett and Palmer in 1876 was beaten on the 2d, by seven minutes.

Two horse thieves were pursued from Eureka, Nev., hy sheriff and posse, and one robber was killed and the other captured.

THE situation at St. Petershurg still continues alarming and the rigorous police regulatione are to be made still more etringent.

Important Mining Decision.

The Suprems Court of the United Statss has just made a decision that should cause prospectors to see to it in locating claims, that they run with ths lode taken up and not diagonally or at right angles across it. The case passed on was that of the Flagstaff Silver Miniog Co., of Utah, plaintiff, in error, vs. Helen Tarbet, in error to the Supreme Court of Utah. The controversy in this cass, remarked Justice Bradley, in delivering ths opinion of the court, relates to respective rights of two miuing companies in the Little Cottonwood district, Utah, who are working subterraneously upon the same lode or vein of ore. The principal question involved is whether the Flagstaff company has a right to carry its excavations underground outside the perpendicularly drawn side lines of its surface location, when by so doing it infringes upon the rights of the adjoining claimant. With regard to the important questions of following lodes or veins of ore helow the surfacs, and the respective rights of contending parties in such casss, this court holds as follows: First—Location of a mining claim upon a lode or vein of ore should he laid aloug the same lengthwise of its course, at or near ths surface nnder mining act of 1866 and that of 1872. Second—Each locator is entitled to follow ths dip of ths lode or vein to an indefinite depth, even though it carries him outside of sides lines of location, hut this right is based on the hypothesis that the eide lines substantially correspond with the course of the lode or vein at the surface, and that it is hounded at each end by the end lines of the location crossiug the lode or vein, and exteuded perpendicularly downwards and indefinitely in their own direction. Third—If the location be laid crosswise of the lode or vein, so that its greatest length crosses the eame, instead of following the course thereof, it will secure only so much of the vein as it actually crosses at the surface, and the side lines of the location will become end lines thereof for the purpose of defining the rights of owners. Fourth—A locator working subterraneously into the dip of a vein bslonging to another locator who is in possession of his location, ie a trespasser, and liable to action for taking ore therefrom. In accordance with these principles, this court holds that the Flagstaff company is outside its rightful houndaries, and it therefore affirms the judgment of the lower court in favor of Helen Tarbet.

Anderson.

This town, centrally located on the Reading grant, is about one and a half miles west of the Sacramento river, on the northern hranch of the C. P. R. R., 11 miles south of its present terminus at Reading. On the east eide eeveral important tributaries enter ths Sacramento from courses which make Anderson the natnral freight aud passenger distributiug point for a large extent of country which is now settling up and increasing in importance—including the Pitt river, Fall river and Modoc country. Many milee of naturally good roads tbus lead off in different directions from Anderson. A large body of fine bottom land liee adjacent.

During the last year the general business of this village has largely extended. Its hotel, livery and postoffice business has more than doubled. Mr. Elias Anderson, the veritable godfather of the town, is postmaster and a highly respected citizen. He established the American Ranch hotel on the Oregon wagon road near the preseut town site some 20 years ago. Last summer he moved a large and eubetantial building into the center of town, which, with additione then made, render the A. R. H. a good traveler'e home, especially under the careful attention of himself and family. Mr. Anderson keeps no har. The "Anderson hotel" (formerly Snow's) has been douhled in size and a ealoou added.

Mr. Edward Frishie, proprietor of the grant, with a large and nobly grown up family, resides near this town.

Wright & Bedford transact a large hardware and general merchandise business. Lovell'e livery stahle, Bell's saloon, Dr. Anderson's, D. P. Quinn's, P. Phifer's and several other residences have hsen built during the past 12 months. The American Ranch hotel is heing again enlarged. Other huildings are in contemplation. E. F. Anderson, Welle-Fargo and Railroad Station agent, inform us that the freighting business increased about douhle last season. Also, that the establishment of a wool, hide, fur and produce purchasing and sale agency, with ample means, would greatly promote business and favor the convenience of merchants and shippers further in the interior.

The increased cultivation of the Reading grant hy suhdivision sales and renting, with other advantages, insures Anderson a steady if not a remarkably rapid growth.

ARRANGEMENTS are heing made to ship Chinamen from here to the South to fill the vacancy left hy the negro exodus.

OREGON parties are going from Umpqua Ferry with mining outfits, to placer diggings at Olalla that yield $2 to $5 a day.

GRANT has arrived at Hong Kong.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO.'S MINING AND SCIENTIFIC PRESS PATENT AGENCY.]

By Special Dispatch from Washington. D. C.

FOR THE WEEK ENDING APRIL 29TH, 1879.

214,000.—PILLOW-SHAM FRAME, ETC.—John R. Adams, Oakland, Cal.

214,807.—FRUIT DRIER—R. B. Blowers, Woodland, Cal.

8,691.—SPOKE-TENONING MACHINE—R. W. Eaton, Watsonville, Cal. (reissue).

214,819.—TIN PAIL—Etienne Guittard, S. F.

214 835.—SYSTEM OF LIGHTING—E. J. Molera and J. C. Cebrian, S. F.

214,975.—ANIMAL TRAP—Geo. W. Williams, San Diego.

214,862.—PISTON PACKING—Samuel A. Youse, Sutter Creek, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent husiness for Pacific coast inventors transacted with perfect security and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of special mention:

CUT-OFF ATTACHMENT FOR DIRECT-ACTING ENGINES.—A. H. Mathesius, S. F. Dated May 6th. This invention relates to certain improvements in direct-acting engines, such as are principally intended to drive eteam pumps, hammers, rock drills and similar machiues, and it consists in the employmeut of a cut-off attachmeut to the steam cylinder, by the use of which the actiou is rendered much smoother, and in certain details of construction, which would be difficult to describe clearly without ths aid of engravings. The steam may be cut off at any point. Iu order to prevent the pressure of steam within the cylinder from being reduced too much below that of the steam chest, which might sometimes happen from too great expansion, small tension valves are employed which are secured to the main valve opening into the ports, provided with springs, eo that when the differeuce in pressure exceeds a certain amount, the springs will yield and allow steam from the chest to yield and enter the cylindsr. By the construction of this cut off a softness is given to the stroke, making it without noiss or jerk, and with a considerable ecouomy of steam.

KING BOLT FOR TRUCKS.—Chas. Oester, S. F. Dated April 22d. This improvement is intended to be applied to trucke for carrying heavy weights, and refers more particularly to the construction and operation of the king bolt, or that portion joining the body of the truck to the front axle, about which the front wheels move in the arc of a circle. The improvements consist in the application of a coiled spring around the king bolt, above tho axle, in such a mauner as to lessen the jar incident to thie part of tbe vehicle and insure a more perfect action of the forward axle and wheels. It also consists in a method of enclosing the spring out of the way of the dust; in a misane of oiling the bearing; and in certain detaile of construction, hy which the improvement is rendered efficient for the purpose for which it ie intended.

FIRE EXTINGUISHER.—Wm. R. Ferguson, Dixon, Solano Co., Cal. Dated April 22d. This invention relates to improvements in that class of fire extinguishers in which a chamber is used for storing an alkali, and inside of the chamber is a fragile vessel containing the acid, meane being provided for breaking the vessel containing the acid and throwing its contents into the alkaline substance, so as to gain a pressure from the resultant gas. Mr. Ferguson's improvements consist in a method of forming a cover for the main chambsr in which the ingredients are placed, so ae to make said cover self-sealing and prevent any escape of gas; and also in a means of treating the acid-containing vessel or otherwise discharging its contents.

SPOKE-TENON AUGER.—Roht. W. Eaton, Watsonville, Santa Cruz Co., Cal. Dated April 29th. This invention relates to certain improvements in that class of spoke-tenoning machinee, which are intended to he clamped to the epoke while the tenon is heing made, and it consists iu a novel construction of the cutter head and in a means for adjusting and centering it upon the spoke. It also cousists in a novel means of adjustiug the mandrel of the tenon auger hy means of swivel supporting rings and operating screws, hy which either end may be adjusted indepeudent of the other and any desired angle ohtained.

MANUFACTURE OF BOOTS AND SHOES.—Joseph Hobart, Nordhoff, Ventura Co., assignor to Hobart, Wood & Co., of San Francisco. Dated May 6th. The improvements consist in securing tbe counter of the boot or shoe by means of rivets along its edges so as to prevent it breaking down and losing its shape; and also in continuing the counter past the vertical leg seam so as to prevent ripping of the leg seam at the point where it most frequently occurs, and preventing also any leakage at that point.

News in Brief.

INDIAN outrages are worrying Texas.

THE late shower reached Shasta county.

DURING April ths public debt increased $19,952.

ANOTHER stage robbery is reported from Arizoua.

Hay making has begun in the vicinity of Oakland.

THE bathing season has been opsned at Alameda.

HIGH water is causing trouhle in New England.

GERMANY is still wrestling with the tariff question.

THE difficulty hetween China and Russia has hsen settled.

THERE is a riot in Cork, many persons have been injured.

FINE salmon are caught in the locks at Orsgon City, Oregon.

SUMMER-FALLOWING is occupying farmers in central Solano.

THE Peruvian governmsnt has called the nation to arms.

THE hay crop is heing gathered in Los Angeles county.

THERE is a strike and riot on the Pacific railroad in Canada.

RAILWAY freights are less activs than for several weeks past.

THE spring wool clip near Woodland falls short of the average.

SZEGEDIN has hcen again desolated hy a violent hurricans.

TROOPS are to be used to keep trespassers ont of Indian Territory.

ADVICES from South Africa indicate that an early peace is prohable.

NEW railroad snterprises are about to be iuaugurated in Oregon.

ONE of the Manhattan Bank robhers has been arrested in Philadelphia.

THE military chest captured at Isandula contained $100,000 in gold.

THE Industrial exhibition at Berlin was formally opened on the 2d.

THE *City of Pekin* carried away two leprous Chinamen on her last trip.

CROPS are excellent along the Merced and on the sand plains of that county.

EASTERN papers are wet-blanketing the "Continental picnic" to meet Grant.

PRINCE ALEXANDER of Battenhurg has heen elected to the throne of Bavaria.

A RECENT cave killed 34 pereons and demolished five houses at Veas, Spain.

KATKOOAT, the Sitka, Indian murderer has been haoged at Portland, Oregon.

A CHINAMAN has opened an English school for his countrymen at New York.

UPWARD of 5,000 flasks of quicksilver were produced in California last month.

IN the Miles polygamy case on trial at Salt Lake ths defendant was found guilty.

RICH silver miues have bcen discovered in Indian Territory near ths Kansas line.

THE great earthquake in Prussia, March 22d, killed 922 persons and destroyed 21 villages.

THE Humboldt basin, from Tule to Battle Mountain, is alive with young grasshoppers.

SIERRA VALLEY rejoices in the appearance there of crickets, as an antidote for grass-hoppers.

THE Mexican government will appropriate $500,000 toward the expenses of the exposition.

THE London and Westminister bank has recently invested $35,000,000 in U. S. eecurities.

A FATHER mnrdered hie little daughter through religious fanaticism recently at Pocasset, Mass.

NO more whisky will ho sold from hars upon the Oregon Steamship Navigation Company's boats.

ONE HUNDRED and forty of the Southern negro refugees, have returned from Kansas to the South.

Quicksilver Mining Publication.

Memoir on the Mines and Works of Almaden, by M. H. Kuss, M. E. Translated from the "Annales des Mines" for the MINING AND SCIENTIFIC PRESS, by S. B. Christy.

CONTENTS.—PART I. Geological Description of the Deposits at Almaden: 1. Introduction; 2. Geological Situation and Constitution; Silurian System; Devonian System; Eruptive Rocks; 3. Deposits of Mercury; Description of the Mine; Mineralogical Constitution of the Vein Matter; Age of the Veins; Abandoned Mines. PART II.—Exploitation of the Mines of Almaden: 1. Method of Exploitation; 2. Organization of Labor; 3. Mechanical Preparation. PART III.—Metallurgy of Mercury at Almaden: 1. Description of the Works; 2. Treatment of the Ore; 3. Losses of Treatment. PART IV.—Administration and History; 2. History; 48 large pamphlet pages, post-paid, 50 cents. DEWEY & CO., Publishers, S. F., 1879.

FRESH attractions are constantly added to Woodward's Gardens, among which is Prof. Gruber's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

EXAMINE the accelerative endowment plan, as originated by the Mutual Benefit Life Insurance Co., of Newark, New Jersey. Assets, $30,533,429.94. Lewis C. Grover, President; L. Spencer Coble, Vice-President; Benjamin C. Miller, Treasurer; Edward A. Strong, Secretary; Bloomfield J. Miller, Actuary. Send for circulars to James Munsell, Jr., agent of insured, 224 Sansome St., San Francisco.

A CLERK who has had good experience in the dry good and grocery business, wishes a situation. Will give substantial and satisfactory reference and accept a moderate salary and "work up." Address "Clerk," at this office.

EXPERIMENTAL MACHINERY, drawings, patterns, models, all kinds of electrical and telegraphic apparatus to order. See ad. F. W. FULLER, 415 Market St., second floor, S. F.

WHITMAN & BURRELL, Little Falls, N. Y.

Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Cherokee Flat Blue Gravel Company.—Location of principal place of business, San Francisco, California. Location of Works, Cherokee Flat, Butte County, California.

Notice is hereby given, that at a meeting of the Directors, held on the tenth day of April, A. D., 1879, an assessment (No. 41), of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the company.

Any stock upon which this assessment shall remain unpaid on the twelfth day of May, 1879, will be delinquent, and advertised for sale at public auction; and unless payment is made before, will be sold on Tuesday, the tenth day of June, A. D., 1879, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

R. N. VAN BRUNT, Secretary.

Office, Room 6, No. 318 Pine street, San Francisco, Cal.

Mount Jefferson Milling and Mining Company—Location of principal place of business, San Francisco, California. Location of works, Garrote Mining District, Tuolumne county, California.

NOTICE.—There is delinquent upon the following described stock, on account of assessment (No. 6) levied on the 21st day of March, A. D., 1879, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amt.
Condee, G M, Trustee	32	3000	150 00
Condee, O M, Trustee for the Mount Jefferson M & M Co.	44	800	40 00

Condee, G M, Trustee	51	2000	100 00
Condee, G M, Trustee	54	1000	50 00
Condee, O M, Trustee	55	1000	50 00
Condee, G M, Trustee	58	11080	554 00
Fassett, N C	21	500	25 00
Fassett, N C	20	1000	50 00
Fassett, N C	22	500	25 00
Fassett, N C, Trustee	7	500	25 00
Fassett, N C, Trustee	8	500	25 00
Smith, O, Trustee	40	1000	50 00
Smith, O, Trustee	41	500	25 00
Smith, O, Trustee	42	500	25 00

And in accordance with law, and an order of the Board of Directors made on the 21st day of March, 1879, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the Company, on Tuesday, the 27th day of May, 1879, at the hour of three o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

R. N. VAN BRUNT, Secretary.

Office, 318 Pine street, Room 6, San Francisco, Cal.

Rocky Point Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Placer county, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 17th day of April, 1879, an assessment (No. 1) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin to the Secretary, at the office of the Company, No. 314 Bush street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 28th day of May, 1879, will be delinquent, and advertised for sale at auction; and unless payment is made before, will be sold on Monday, the 16th day of June, 1879, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Directors.

T. L. BIBBINS, Secretary.

Office, 314 Bush Street, San Francisco, Cal.

Fine Engraving.

The Engraving Bureau belonging to the office of this journal is prepared to design and engrave all kinds of WOOD CUTS for illustrating newspapers, books, catalogues, cards, circulars, advertisements, labels, badges, seals, etc., in the best style of the art. Our portraits and illustrations of machinery, buildings and landscapes, are superior. Good engravings can be made from paintings, lithographs, steel and copper plate prints, photographs, models, patent office or other drawings. We have a photographic department and the best of machinery for producing accurate and perfect work at the lowest prices. Original maps, charts, and diagrams are made by our NEW PHOTO-RELIEF PROCESS at greatly reduced rates. By the same process copies can be cheaply and quickly produced of printed cuts, in *fac simile*, or they can be enlarged or reduced with equal facility.

Any hand writing in perfectly black ink on clear white paper for manuscript letters or circulars, will be accurately reproduced in metal plates suitable for common printing. Also, *fac simile* signatures, monograms, sheet music, etc. We excel in trade cuts and matched plates for combination color printing. With a large business, long established, and every facility for improvement, we can guarantee more than ordinary satisfaction to all of our patrons. All interested are invited to send for or call and see specimens and obtain prices.

Orders for electrotypes, stereotypes, steel and copper plates, lithographing, stamps and seal presses executed at low rates.

BUY LAND

Where you can get a crop every year; where you will make something every season; where you are sure of having a crop when prices are high; where you have a healthy place to live; where you can raise semi-tropical as well as other fruits; where you can raise a diversity of grain and vegetables and get a good price for them. Go and see the old Reading Grant (in the upper Sacramento Valley), and you will find such land for sale in sub-divisions to suit purchasers—at reasonable rates and on easy terms. Send stamp for map and circular to EDWARD FRISBIE, proprietor, (on the Grant), Anderson, Shasta Co., Cal.

Some fine sunny offices (next to the PRESS office), to rent (at very reasonable rates), by Dewey & Co., at 202 Sansome street, corner of Pine.

Books for Miners and Millmen.

KUSTEL'S ROASTING OF GOLD AND SILVER ORES, and the extraction of their respective metals without quicksilver. Illustrated. 142 pages. 1870. A valuable and carefully written work. Postpaid, $2.50. Published and sold by Dewey & Co., S. F.

KUSTEL'S CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for gold-bearing sulphurets arseniurets, and gold and silver ores generally, with 120 lithographic diagrams. 1867. This work is unequaled by any other published embracing the subjects treated. Post-paid, $7.50. Printed and sold by Dewey & Co., S. F.

PHILLIPS' EXPLORERS, MINERS AND METALLURGISTS COMPANION, comprising a practical exposition of the various departments of exploration, mining, engineering, assaying and metallurgy. 632 pages and 83 illustrations. A most valuable and comprehensive book of reference to prospectors and practical miners. Post-paid, $10.50. Published and sold by Dewey & Co., S. F.

A BRIEF TREATISE AND WORKING SILVER ORES.—Illustrated. 11 pages. 1876. A useful and practical work, free from technicalities and extremely serviceable for miners' use. Post-paid, $2. Published and sold by Dewey & Co., S. F.

COPP'S HANDBOOK OF MINING LAWS.—Containing the U. S. Mining Laws, Digest of Decisions, Forms, etc. 1877. Pocket size and very handy and convenient for miners. Post-paid, $1. Sold by Dewey & Co., S. F.

DEWEY & CO.

American & Foreign Patent Agents,

OFFICE, 202 SANSOME ST., N.E. COR. PINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemburg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We *can and do* get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free

Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

DEWEY & CO.

United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 202 Sansome St., N E. corner Pine, S. F.

NOTICE

TO THE

MINING PUBLIC.

MESSRS. RANKIN, BRAYTON & CO., of the Pacific Iron Works, are the only parties authorized to manufacture HOWELL'S IMPROVED WHITE FURNACE under the License of this Company.

THE STETEFELDT FURNACE CO.,

By C. A. STETEFELDT, President.

Referring to the above, the undersigned would call attention to the fact that by a compromise recently effected with the STETEFELDT FURNACE COMPANY, they have secured the use of all the patents of said Company applying to

Revolving Cylinder Furnaces,

And are thus enabled to give purchasers the license of all patent claimants, to-wit:

WHITE, HOWELL, THOMPSON,

— AND THE —

Stetefeldt Furnace Company,

Thereby avoiding all further litigation in reference to these rival claims. The great

SUPERIORITY OF THE FURNACES

Embracing these patents has been satisfactorily demonstrated. There are now some thirty of them in operation in the various mining districts of the coast, operating in all cases with economy and satisfaction, working in many localities

THE BASEST AND MOST REFRACTORY ORES UP TO 90 AND 95 PER CENT.

By an improvement—the patent for which has recently been allowed—this Furnace can be readily adjusted so as to work with equal facility and effectiveness all classes of ores.

The following are some of the Mining Companies who have recently adopted this Furnace, the most of which are now in successful operation, many of them running two and some three and four Furnaces.

NEVADA.—Grand Prize, Star, Martin White, Highbridge, Columbia, Alexander, Paradiso Valley, Jefferson, Leopard, Eagle, Endowment, Independence.

ARIZONA.—Tiptop, Tiger, Peck, Hackberry, Corbin, Tombstone, Bradshaw.

OREGON—Monumental.

MONTANA—Alice Mine, Butte City.

MEXICO—Trinidad, Harmiguera, Piomoses.

PERU—Cerro de Dasco.

RANKIN, BRAYTON & CO.,

Pacific Iron Works.

CAUTION.—All persons are hereby cautioned against buying from other parties Furnaces embracing any of the improvements covered by the patents above mentioned, as they will be vigorously prosecuted and involved in heavy damages.

With Adjustable Cut-off Poppet Valve Engine, and Forced Iron Crank Shafts.

Mining Machinery Depot,

PARKE & LACY,

No. 417 Market Street, San Francisco.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

THE SAFETY POWDER COMPANY,

San Francisco, Cal.

CARTRIDGE.

GEN. W. S. ROSECRANS, President.

COL. SAM'L O. GREGORY, Secretary.

Fuse Lighter and Fuse.

Safety Cap and Fuse.

Electric Cap.

Safety Powder, Caps, Electric Caps, and Fuse Lighters.

Under a series of U. S. Patents, after long and carefully conducted experiments and thousands of tests, this Company is prepared to manufacture and supply, for Mining and Engineering Works, the above named articles at prices and on terms as favorable as articles of similar grades are now supplied in this market. Our Powders contain no Nitro-glycerine, no Nitroline, no Gun Cotton, no Fulminates, and are free from the unavoidable dangers in manufacturing transporting, handling and using of all high grade explosives which contain those elements.

Cold does not affect them. They cause no headaches or other inconveniences in handling, and the smoke from their explosion contains no poisoning or sickening vapors.

Their blasting force, with slight tamping, at least equals that of any Powders now used, but they admit and require strong tamping to bring out their immense and peculiar lifting power which follows their detonating work. They should be fired, therefore, by our

Safety Cap,

Which allows tamping without danger. They can be fired by any caps now employed in blasting, but the use of these is always dangerous with any Powder, and the loss of the throwing power resulting from lack of tamping renders it with our Powders doubly objectionable.

Our SAFETY CAPS have twice or thrice the force of triple Giant Caps. When set on fire they do not explode, but merely burn off, and are perfectly safe in transporting and in tamping.

In round tin boxes, 50 cents.

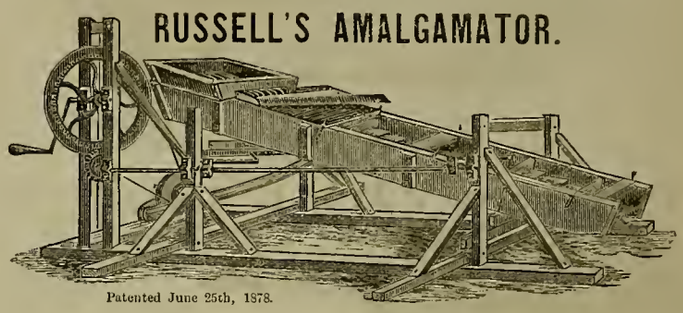
The Safety Fuse Lighter,

Cheap, handy and sure to light the Fuse upon the end of which it is fastened, only needs a trial to be appreciated by every miner who is up to "snuffs." 25 Cents per box; sent by mail.

Safety Fuse,

Equal to the best in the market, will be supplied at the lowest market prices.

RUSSELL'S AMALGAMATOR.



Patented June 25th, 1878.

SAVE YOUR GOLD

And Also SAVE YOUR QUICKSILVER.

The above Washer and Amalgamator with new patent Wire Bridge Quicksilver Boxes attached, can be worked wet or dry, either by hand, steam, horse or water power, and is easily taken apart and packed. For washing Pulp, Earth, Gravel, Mill Tailings or Black Sand, it is without a rival.

Has been Thoroughly Tested and given Complete Satisfaction.

The entire Lining, Hanging Plates, Riffles and Boxes Amalgamated

IS GUARANTEED TO SAVE THE FINEST OR FLOAT GOLD.

Capacity, 30 to 60 tons per day, according to size. For further particulars apply to

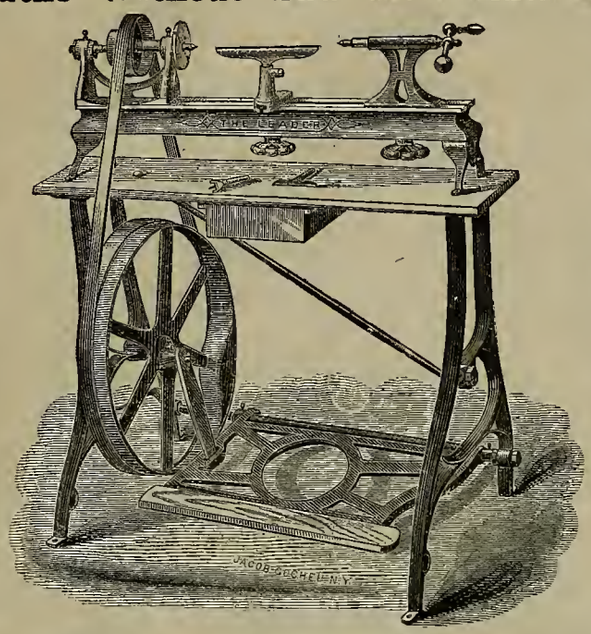
Lathe Without Saw Attachments.



This Lathe has been made especially to meet a want felt by many for a really good and substantially made Foot Lathe at a reasonable price, and we think that we can safely say that it is by far the best Lathe ever placed on the market at the price asked. The bed, head, and tail stocks are of iron; the spindles of steel. The bearings of the head stock is conical, so that the wear can be easily taken up.

Material eighteen inches long and eight inches in diameter can be turned on it. The pieces that accompany this Lathe without extra charge are two T rests, two plain centers, one spur center for wood turning, and one face-plate.

Price of Lathe without Saw Attachments.....$45. Price of Lathe WITH SCROLL Saw Attachment.....$55.
Price of Lathe with both Scroll and Circular Saws, $70.

Trump Drill Chuck.

Chuck, for drills ¼ and under, Price.....$1.50
Chuck, for drills ½ and under, Price.....$2.25

They are made on solid steel plug, centered and *readily fitted to Lathe or Drill Press.*

The best CHEAP Paper in the World.
H. S. CROCKER & CO.

C. C. Bitner's Apparatue for Obtaining Metallic Copper from its Solutione.
Patented March 18th, 1879. Will precipitate with steam in three hours, requiring no machinery to run it. Cost of constructing apparatus, $75. The old cylinder process takes four hours to precipitate and costs from $1,200 to $1,500 to construct, besides the machinery to run it. For right to use my Precipitator address C. C. BITNER, Spenceville, Nevada County, California.

— PATENT —
LIFE-SAVING RESPIRATOR
Prevents Lead Poisoning and Salivation.

INVALUABLE to those engaged in Dry Crushing Quartz Mills, Quicksilver Mines, Guano Works, White Lead Corroding, Feeding Threshing Machines and all occupations where the surrounding atmosphere is filled with dust, obnoxious smells or poisonous vapors. The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price $3 each, or $30 per dozen. Sent post-paid to any address upon receipt of price

GIANT POWDER
MANUFACTURED UNDER A. NOBEL'S ORIGINAL AND ONLY VALID NITRO-GLYCERINE PATENTS
Nos. ONE, TWO and THREE.
Stronger, Better and Safer than any other High Explosive.

Judson Powder
IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.
It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. Triple Force Caps and all Grades of Fuse.

BANDMANN, NIELSEN & CO.,
SAN FRANCISCO, CAL.

VULCAN BLASTING POWDER.
The Strongest, Safest, Most Uniform and Reliable "HIGH EXPLOSIVE" Manufactured on the Coast.

MINERS TESTIFY THAT IT IS FREE FROM OBJECTIONABLE FUMES.

We call the attention of all desiring such a Powder to our various grades, which we are prepared to sell at LOWEST RATES.

No. 1.—Equalling Liquid Nitro-Glycerine in Strength. We recommend this Grade in extremely hard rock, boulders, iron, etc.
No. 2.—Will do the work thoroughly in all but the hardest kinds of rock.
No. 3.—For bench work, pipe-clay, soft and shelly rock, outside work and quarrying.

Single and Triple Force Caps, Fuse of all Grades, Vulcan Powder Thawing Boxes, Batteries and Exploders, For Sale at the Lowest Rates.

VULCAN POWDER COMPANY,
Office, 123 California Street, Rooms 25 and 26, - - SAN FRANCISCO, CAL.

BOOKS RELATING TO **PRACTICAL SCIENCE.**

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, MAY 17, 1879.

VOLUME XXXVIII Number 20.

Geysers.

Prof. Joseph LeConte in his rocently puhlished work, "Elements of Geology" (Applston & Co.), in spoaking of goysers, says: In magnificsnce of geyscr displays, however, Icsland is far surpassed hy the geyser hasin of the Firehols river. This wonderful geyser region is situated in the northwest corner of Wyoming, on an slevated volcanic plateau near ths headwaters of the Madison river, a trihutary of the Missouri, and of ths Snake river, a trihntary of the Columhia. The hasin is only ahout three miles wide. Ahout it are ahundant evidences of prodigious volcanic activity, secondary volcanic phenomsna heing developed on a stupendons scale, and of evsry kind, viz: Hot springs, carhonatsd springs, fumaroles, mnd-volcanoss and geyssrs. In this vicinity ars more than 10,000 vents of all kinds. In soms places, as on Gardnsr's river, the hot springs ars mostly lime-depositing, and in othsrs, as on Firehole river, they are gsysers depositing silica.

In ths upper geyser hasin, the vallsy is coversd with a snowy deposit from the hot geyssr waters. The surfacs of ths mound-like, chimney-liks and hive-like slevations, immediately snrrounding ths vents, is, in soms cases, ornamsnted in ths most sxquisite manner hy deposits of the same, in ths form of scolloped embroidery set with pearly tuhercles; in others, the silicions deposits take the most fantastic forms. In soms places the silica is deposited in large qnantitiss, thres or four inches deep, in a gslatinous condition, liks starch paste. Trnnks and hranches of trees immersed in thsss waters are speedily petrified.

We givs an engraving of one of these gaysers, taken from Prof. LeConte's hook. It rspresents the Bes-hive, so-called from ths shape of its mouud. This geyser shoots up a splendid column, two or three feet in diameter, and to the hight hy measuremsnt of 219 feet, and plays 15 minutss each time.

The Woodruff Scientific Expedition.

This expsdition which has hesn before ths pnhlic for over a year in vain attempts to maks it a sucosss, has at last wholly and finally collapsed. The reasons are that thers has heen an almost total want of support and in addition an almost total failure on the part of those who did promise to coms up at ths proper time with thsir suhscriptions. There wers ssveral serious drawhacks to the sxpedition which will satisfactorily acconnt for the want of patronage. First, the expense. The fare for the round trip was fixed at $2,500. This, in itself, was snough to har the larger class of peopls, and left the sxpedition to hs patronized almost wholly hy the sons of the very rich. Second, the practical light in which the cost of such an expedition would compare, with the same amount of monsy expsnded on education at home. The facts hear out the assumption that the average person of means, who alone could afford such expsnditure, is not hlind to ths fact that plsasure and work, sight-seeing and study, are not wholly compatible with each other, and that he hssitatss at the possible dangsr of sending his sons so far away, exposing them to ths dangers of the ocean, and rsmoving them from all restraining influencs except the untried discipline of a floating faculty. The expedition has already cost no little time and money and its projeetors will undoubtedly lose heavily.

Fine Gold.—Mr. Louis Blanding, during a recent mining trip to Tuolumne county, had his attention called to the exceptionally high fineness and value per ounce of the gold from the "San Guisseppi" quartz mine, near the town of Sonora. He tells ua that in his experisnce of 20 years he has never known or heard of quartz gold going to 978 fine, equal to $20.24 per ounce. This result was given hy a lot worked in his own mill, and it is sufficiently interesting from its rarity to make a note of.

The Sutro Tunnel—What we May Expect from It.

That tho Sutro tunnel will hs of great advantage to ths Comstock mines, as a msans of fresing them more readily of water, cannot he disputed. That ths orss from thess mines will ever bs brought out through this adit, is not, however, quite so clear. The length of this tunnsl, from its entrance to its point of intersection with ths Comstock lods, is four miles. From the lattsr poiut to ths different mines along ths lode, ths distance is, of courss, variable, hut will average (say) one mile, making ths total distance from the mines to the mouth of ths tuunel five miles, to be traversed hy cars. If large quantities of ore are hereafter found in thess mines it will lie below the level of the Sutro tunnel, necessitating the use of hoisting works to lift it to that level. Works having sufficient capacity to perform this ssrvice have alrsady heen supplied to many of these mines, and through the employment of which great quantities of ore can be cheaply and quickly hrought to ths surface. With these apphances already on hand, or easily provided, it is hardly to he supposed that the ores will he loaded into cars and forced to make a journey of fivs miles to a point of exit. This would bs attended with too much delay, if not also with increased cost. And so also in the matter of taking the workmen in and out of the mines. To pass them through the tunnel would he wholly impracticahle. They will have to he lifted and lowered, as at preseut, hy steam. The Sutro tunnel will he of great henefit to these mines in the way poiuted out. It will also, in some slight degree, help promote their ventilation; hut it is not worth while to claim for it more than it can accomplish—of this we have had enough already.

THE BEE-HIVE GEYSER.

Parties from San Francisco are looking at the hlack-sand gold diggings at Gray's Harhor. These have been prospected and not found to pay in the past.

The Freaks of Commerce.

The cargo of the ship *Three Brothers*, lately dispatched from New York for this port, consisted in part of a tolerahly heavy invoice of lye, soda, saleratus and hrimstone, so ths telsgraph informs us. Now, if thers are any mincrals of which we have hers on this coast a supsrahundance—have in unnecessarily and disgustingly largs quantity, so to spsak, thsy consist of these same stuffs so ahout to be imported on ths good ship *Three Brothers*. Talk of carrying coal to Nswcastle! There is commercial sense in that compared with shipping the ahove commodities to San Francisco. Ons would think soda might as well hs sent to the Dead Ssa and sulphur to the hottomless pit as to hs shipped out here. We have in Nevada, and not far from the railroad, sulphur enough to supply evsry modern demand. As for ths alkaline salts, we have deposits over thsrs that havs never heen measured, simply hecause their extent is immeasurahle. There are a good many thousand acres of them, anyhow! But this is liks our economy! There is, howcver, one redeeming feature in the case of thess sulphur and soda importations: they were not originally products of this country, sent away, and having made half the circuit of the glohs, coming hack, after the manner of quicksilver, which metal we have latcly heen in the habit of freightiug over to China, selling it there, then buying it up, rcshipping it to this port and here supplying it to the local trade at satisfactory figures—all of which eccentricities are mysteries to the unmercantile mind.

The great Ford-Holden mining suit, involving several million dollars, and which has cost the parties to the suit $65,000, has heen aettled, and all claims against the old Telegraph mine have heen released.

A lottery is to he organized in France to raise a fund for the completion of the Statue of Liherty presented to the United States.

The Quartz Mines of California and the Blue Ridge Belt.

In rsply to a lstter from the East inquiring whether the Providence mine nsar Nsvada City, in this Stats, is hsing worked helow watsr line and if the sulphurets can he profitahly treated, ths *Transcript* answers in the affirmative, rsmarking at soms lsngth upon the comparative msrits of the California quartz mines and those situated on the Blue Ridge gold hclt, reaching from Virginia to Georgia. In addition to what that journal has said in this connsction it would have heen pertinent to show how insignificant the product of this Blus Ridge helt appears heside that made hy the qnartz mines of California. Among the Atlantic States that have yieldsd gold enough to make a record are Virginia, Gsorgia, ths Carolinas, Tennessee and Alahama. The business in that region was hsgun over 70 years ago, and has heen prosecuted steadily ever since, in some localities on quits an extended and in others on a more limitsd scals. Ths total value of the gold produced in these States to date, as returned to the mint, amounts to about $32,000,000. As this reprssents fully 90% of ths entire production mads, the latter may hs set down at $35,000,000, hsing at the average rate of $500,000 per year since the husiness of gold gathering was first commsnced thers. As we have in this State single mines that yield annually a much larger sum, this Blue Ridge country makes, in the ahove, hut a sorry showing compared with the aggregats ontput of California.

What ths *Transcript* says in regard to the greater tractahility and valus of our ores is much to ths purposs. The fres milling ores from the Providence and othsr mines on that lode havs averaged $27.50 per ton, exclusive of the sulphurets, of which there ars two grades, class No. 1 containing ovsr $100 to ths ton, and class No. 2 containing from $25 to $30 per ton. Thsse orss carry, in various proportions, lead, iron, antimony, arsenic and sulphur, with a littls zinc and copper. That they can he worked with profit is evidsnced hy ths fact that they carry such a large amount of free gold, nor have ths sulphurets heen found especially hard to treat.

Of the hundreds of mines that have in times past hesn opened along the Blus Ridgs helt, not more than five are said to havs yielded any profit hslow ths water line, on account of the extremely rsfractory character of their ores, which contain zinc, carhonates, oxides and sulphursts of copper, with arssnic, antimony, iron and sulphur, and possss the had characteristics of growing more rehellious with dspth. Thsy have, in fact, shown themselves so unmanagesbls that only in a few oases have they hesn worked successfully. Then, too, they occur, as a general thing, only in nests, small and uncertain, while they ars quite uniformly of very low grads, containing on an averags hardly mors than one-fourth as much gold as our California ores. Surely thoss having capital to emhark in this hranch of mining had hetter seek California as a hsld for investmsnt, than to venture their monsy in a quarter so difficult and hazardous as this Blus Belt region.

Producing Mines on the Comstock.—The product of hullion made hy the Comstock mines during the first quarter of ths current year amounts to $2,372,230, as against $10,358,900 during a corresponding period in 1878, and $7,549,500 in 1877. This is a startling falling off and is made the mors impressivs hy the fact that the ores taken out have meantime heen growing steadily poorer. Of the hullion taken out this year, nearly two hundred thousand dollars has come from the tailings worked over, and which have also heen tending constantly to a lower grade. The only mines on the Comstock range from which ore is now heing taken in any quantity are the California, Consolidated Virginia, the Ophir and the Sierra Nevada, the Trojan, Justice, Con. Imperial and Chollar yielding small quantities in an irregular way.

Promising diggings have heen discovered on Dutch creek, Nev.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

On the Great Continental Divide.

The Wilderness at the Head of the Missouri, Columbia and the Colorado Rivers.

[Written for the PRESS by CHARLES F. BLACKBURN.]

Having spent the greater portion of the past two years prospecting in the country lying about the head waters of the Yellowstone and the other great rivers that have their sources in the Wind River mountains, I send herewith for publication in the PRESS some hastily prepared remarks on the region so traversed and explored, and some portions which had probably not before been passed over by any white man. Though mainly in search of metalliferous deposits, I found much in the other natural products of that vast wilderness as well as in its geology, scenery and other physical features, calculated to interest both the practical and the scientific mind.

The Big Horn Mountains—Geology and Topography.

Touching the geology of the country in the vicinity of the Big Horn mountains, it may be observed that the usual calcareous and arenaceous rocks are here found, varying in geological ages from the azoic to the tertiary deposits. Many of these strata are highly fossiliferous, including a great variety of fossils of aquatic origin. No fossil fauna was seen near the base of the range, but east of the mountains in the lignitic tertiary beds, the remains of petrified mammals were noticed. The stratum of the carboniferous age occurs on both sides of the range near its base, both anthracite and bituminous coal being found in abundance. Mountain limestone or the sub-carboniferous strata envelops the mountains to an elevation of 2,000 feet above the base, where they break down abruptly to the azoic rocks, thus the crystalline rocks appear at an altitude of 9,000 feet above the ocean, and compose the more elevated parts of the range. Near the summit a compact, fine-grained grayish granite predominates, which is occasionally varied by belts of gneiss and patches of mica schist. At the south end of the range at its junction with the Rattlesnake range, mica and talcose slate are found traversing the granitic rocks. But little quartz occurs on the western slope, either *in situ* or as float. The eastern slope, however, shows considerable quartz in well-defined ledges, usually of a gray color and often ferruginous. Some of these lodes proved to be auriferous, but the gold was in such small quantities generally as to not defray expenses of mining. The highest elevations in the Big Horn range are Cloud peak and Hayes peak, which reach an altitude of 13,500 feet. Several other peaks reach an altitude above 13,000 feet. The length of the crystalline rocks, of this range is 200 miles, their greatest width which is at Cloud peak, being 25 miles. The range is severed at the north end by the grand canyon of the Big Horn river, which presents a scene of rugged grandeur, with its walls standing vertically fully 3,000 feet high. The length of this canyon is nearly 40 miles, and for sublimity and picturesqueness of scenery, it rivals that of the famous grand canyon of the Yellowstone, in the National park. In the Big Horn mountains colors of gold can be obtained from nearly all the streams, especially from an allnvial deposit of quartz wash around the foothills. This deposit shows infinite attrition, and is evidently not indigenous to the crystalline rocks of the Big Horn range. This foreign deposit in all cases proved to be auriferous, which is not always the case with the original deposits from the crystalline rocks of this range. Taking these facts into consideration I arrive at the conclusion that the gold found about the Big Horn is not all from that range, but that most of it is derived from this ancient wash, which I subsequently traced to the head of Wind river through Union pass and down the Snake. The idea was generally entertained by our prospecting miners that the fine colors of gold found around the base of the Big Horn range came originally from some auriferous belt in those mountains. We are now in possession of geological evidence, however, that disproves this theory. Gold in small or even paying quantities may yet be found in these mountains, but extensive deposits can hardly exist there without showing some indications of its entity.

Metal Deposits of the Snowy Mountains.

In the Snow mountains, between Clark's fork and the Yellowstone, indications are more favorable for both gold and silver. The original rocks here are as follows: Gneiss, granite, syenite, trachyte, porphyry, mica and talco slate; while along the southwest bass volcanic tufas occur. At the head of Soda Butte creek argentiferous galena is found, which yields a fair percentage of silver. Some of these deposits are being developed by Judge Annis and others. Auriferous ores are found *in situ* on Emigrant and Bear gulches, also fair indications on Hell-Roaring creek. On the northern slope extensive deposits of native copper occur near some trap dikes. Below the canyon of Clark's fork some interesting fossiliferous deposits exist in the calcarious sedimentary rocks. The strata here upturned vertically presents to view the organic remains of past ages in such bold relief, as should make this an entertaining field for the geological scientist. Both vertebrate and invertebrate remains were noticed here at various points. Several peaks in this Snowy range reach an altitude of 13,500 feet. Conspicious among these, towers the Russian Crown, with its snowy crest bearing incipient glaciers, and veiled in the shroud of perpetual congelation; a fit home for the ice king.

Sierra Shoshone Mountains.

The Sierra Shoshone range begins at the head of Soda Butte creek and extends south to the head of Wind river, a distance of about 150 miles. Pretty thorough observations and prospecting were made here. The geological formation consists principally of volcanic rocks, basaltic and doleritic lavas, andesite and lava tufas, or a kind of volcanic conglomerate. On the South fork of Stinking Water a belt of gneissoid granite exists, containing many ledges of base ores, but no metalliferous deposits of value. At the mouth of the lower canyon near an offensive smelling sulphur spring (from which the name Stinking Water originated) I found as much as 25 cents to the pan on bedrock, but only in very limited quantity: origin evidently in the lower canyon range from quartzose, granitic rocks or silicious granite.

At the head of the Middle fork of Clark's fork some cuperiferous ores were obtained *in situ* near an extinct volcano. The deposits are argentiferous, and seemed inextensive. On the North fork of Stinking Water colors of gold can be found: origin either from the trap rocks or the crystalline rocks, prior to the great trap eruption which has intruded on or capped the primitive rocks. Petrified wood was also found on this stream containing grains of iron (sideroferite). In this vicinity the mountains present a unique and striking scenery, the geological formation consisting of trap dikes, resulting from a great outflow of lava which has here accumulated in mountain masses. Floods of water have subsequently cut through these with irresistible force, leaving isolated pinnacles and towers standing like great sculptured images. Showers of volcanic sand containing much oxide of iron have covered the tops of the strange objects, which viewed from a neighboring hight look like gigantic columns standing amidst the ruins of a great city.

On the western slope of the Shoshone range volcanic glass is common, this substance being also found extensively in the National park. Standing in this range are several peaks having an elevation above 13,000 feet. Four extinct volcanoes were here discovered, from some of which the sulphurous gases are yet escaping; native sulphur being abundant in their craters. Among the noted elevations of this range are Index and Pilot peaks, and Mt. Langford and the Washakee Needles. The Owl Creek range is a spur of the Shoshone mountains, which, with the Rattlesnake range, connects the Big Horn with the Shoshone mountains. These two spurs are divided by the canyon of Wind river, their summits being only 9,000 feet high. Their trend is east and west, but the rocks are stratified in a northerly and southerly direction. The formation consists principally of metamorphic schistose rocks, quartz being also found in abundance. In panning the alluvial deposits colors of gold were obtained; also garnets, rubies, rutile, crystals of zircon, fragments of itacolumite and other associated minerals found generally with diamond deposits; none of the latter crystals were, however, found, though their existence in this vicinity is not a geological impossibility. Owing to the inclement weather thorough explorations could not be made, but I shall resume operations in this field in the near future.

The Wind River Mountains.

The Wind River group of mountains may properly be termed the American Alps. This region is one of great interest as illustrating the marvelous effects of the dynamical force when used in mountain making. All along the range occur sharp spurs narrowing as they rise till they seem as thin as a knifs blade. Isolated peaks inaccessible to man; deep chasms filled with snow and ice which never melt; alpine hights, awe-inspiring and wearing their glacial crowns in majestic silence; huge blocks of gneiss and granite hills are seen on every hand. The crystalline rocks at the north end of the range are composed principally of granite, gneiss, trachyte, syenite and feldspar, while at the south end the slates appear. Here quite an extensive auriferous belt exists which has afforded fair mining ground for several years. Gold also occurs on the numerous streams of the Wind River drainage. The water at the head of Green river is slightly tinged with a fine powder produced by the moving glaciers crushing the rocks near the summit of the range. No gold was found on this stream in the mountains. The altitude of Union peak is about 13,000 feet.

Green River—An Extensive Hydraulic Gold Field.

Although their elevation is not very great, these Wind River mountains constitute the grand divide of all our great continental rivers. Their southern slope is drained by Green river, while at their western base the Grosventre fork of Snake river gathers a great mass of water to be carried forward and emptied into the Columbia. Their northern slope is drained by Wind river, which, through the Big Horn and the Yellowstone, becomes tributary to the turbid Missouri. The greatest elevation in the Wind River mountains is a peak lying southeast from Union, its hight being a little over 14,000 feet above the ocean level. Several others near this one have an altitude nearly as great. Immense glaciers were discovered here, also perpetual frozen lakes, the ice being still firm in the month of August. Between the Grosventre and Buffalo fork of Snake river auriferous gravel exists, probably in paying quantities. The area of this auriferous tract is 20 miles wide and 40 miles long, and extends as far west as the Teton range. Being evidently an oceanic deposit, this wash shows infinite attrition, even the boulders being polished by long transportation from their original situation—origin unknown, but evidently in the northwest mountain ranges. This wash is of variable depth and is wholly composed of quartz. The nucleus, or the rocks from which this quartz originated, especially that which accompanies the wash, has been reduced to sand by attrition, only the quartz having resisted pulverization. From the prospects obtained here I judge that much of this ground might be profitably worked by the hydraulic process, as water is plentiful, but it would not pay by any other method of handling.

The Snake river drainage has cut many canyons through this wash, the eroded matter having been carried down and deposited along that stream. This is doubtless the origin of the flour gold found on the lower Snake, which has afforded remunerative mining ground for a number of years. This great auriferous debris at the head of the river lies on lime and sandstone rocks. The deposition was made evidently prior to the upheaval of the main divide, as it caps the summit at Union Pass and extends down Wind river quite a distance. But it does not contain gold in such large proportions as the gravels of the Pacific slope. I would not advise miners to go to that country unless they possess sufficient capital to open and operate hydraulic grounds. In the Teton range the crystalline gold-bearing rocks abound, and some auriferous ores were here found *in situ*. Owing to the lateness of the season and the inclement weather, thorough exploration of that district could not be made, but I intend to return to it and determine its value for mining purposes. The Teton is one of the most wild and rugged ranges on this continent. Mt. Hayden and Mt. Moran are the highest elevations there, the former being the keystone of the range. This Alpine peak culminates at an altitude of nearly 13,900 feet, and is visible from nearly all parts of the National park.

Barometrical Observations.

The following altitudes were noted in these several mountain ranges, with observations on vegetation, etc., between latitude 42° and 46° north: The main elevation only is given; the difference in the extremes between the north and south slopes of the mountains exceeding often 1,000 feet. Incipient evergreens, 6,000 feet above the ocean; limits of foliaceous trees, 9,500 feet; gramineous vegetation, 10,000 feet (which is also the limit of evergreen trees); foliaceous shrubbery, 11,000 feet; of evergreen shrubbery, 11,500 feet; limits of alpine flowers and herbaceous vegetation, 12,000 feet; perpetual frozen lakes and incipient glaciers, 13,000 feet; pseudo-meteoric dust or red snow (*palmella rosea* of the English writers) is visible at an altitude of 13,000 feet; glaciers of vast extent exist between 13,000 and 14,000 feet above the ocean, especially in the Wind River mountains. Close attention was given to timber line in this country, and wherever noticed I found trunks of dead trees above those of the living; unmistakable evidence of increasing cold. Another notable feature near timber line on the north slopes of the Wind River range, was that the trees, instead of standing vertically, are found leaning to the southeast, being occasioned by the terrible winds that blow here from the northwest.

Zoology.

The fauna of this country does not differ materially from that of other parts of the Rocky mountains. Buffalo are found in large herds through the Big Horn mountains, but they are being rapidly exterminated by the Indians. Elk and mountain sheep are very plentiful through all the ranges of the Yellowstone country, being generally found near the snow in the summer, where the grass is new and tender. The mountain goat (*Aplocems mountanus*) was not observed in any of the ranges, but has been reported by Indians to exist in the mountains farther north. Only two specimens of the moose were seen. Deer are very plentiful, antelope being generally found around the foothills and on the plains in large herds, also in the National park. No gazelle were found here, but in the Black Hills before populated I shot several of this species of deer, they being numerous on the Belle Fourche river. Bear are very abundant in this region. In the Big Horn range I have seen as many as 20 in one day. They are of four kinds, generally known as the Rocky Mountain grizzly, cinnamon, black and silver tip. Mr. H. R. Wormwood and myself on ascending a peak in the Sierra Shoshone range last July, saw 10 bear at one sight, two of them which we shot. They were feeding on the ubiquitous grasshopper. The snow in these high altitudes is sometimes black with these insects, which get so thoroughly chilled after alighting, that they are unable to fly away. The plaintive bleat of the little coney (*Lagomys princeps*) was heard on all sides, above an altitude of 10,000 feet, and so far as I could ascertain, this rabbit lives at a greater elevation during the winter than any other animal. It was found in the all local ranges near the limits of vegetation. The mountain lion, wolf, coyote, lynx and a great variety of the minor carnivorous genera inhabit this region. The chief fur-bearing animals indigenous here are the black and silver gray fox, otter and beaver. Baird's rabbit (*Lepus Bardii*) is met with in the Big Horn, Shoshone and Snowy mountains. This interesting species was seen in the dense forests of the evergreen zone, about 8,000 or 9,000 feet high. The little chipmunk, as usual, was often around camp inspecting our provisions. The little water ousel we noticed along all the mountain streams, this little bird appearing to have a fondness for rushing torrents, cascades and deep canyons, its twittering songs mingling harmoniously with the musical hut thundering falls of water. Allan's finches (*Leucosticte australis*) were noticed in the Big Horn mountains, near the limits of vegetation. The dusky grouse (*Tetrao obscurus*) is common, although not as numerous as Richardson's grouse. A great variety of aquatic fowls is noticeable in the lake regions of the Yellowstone and Snake rivers, the swan, pelican, gull, crane, loon, goose and many kinds of ducks abounding here, where they remain during incubation in the summer months. The American eagle is very numerous around the Yellowstone lake, also its co-tenant the fish hawk. The Alpine insect fauna of these mountains is similar to that found in the ranges of Colorado; but owing to the paucity of vegetation insects do not thrive here at as great an altitude as they do further south, where lichens and flowers are more abundant. Very little insect life could be found here above timber line. On the the highest peaks no organic life of any description was visible. I really suppose the pole itself presents hardly a more barren and frigid scene of desolation than these glacial peaks. Along the east base of the Big Horn range, we meet with a fine agricultural country, having an average altitude of 6,000 feet. The climate is very healthful, and the country blessed with a cool and bracing atmosphere. The upper tributaries of the Big Horn, Yellowstone, Snake and Green rivers, are unfit for agricultural purposes, owing to their altitude and roughness. Some spots are, however, fit for grazing and stock rearing.

The National Park.

As most of your readers are probably somewhat acquainted with the topography of this spot, I will confine my description thereof to merely a synopsis. This great wonderland lays between the Sierra Shoshone and the Rocky mountains, between latitude 44° and 45° north, its mean altitude being about 8,000 feet above the ocean. It has an area of 2,500 square miles, covering for the most part a very abrupt and broken country, abounding everywhere with impressive views of mountain scenery. The interior, however is very beautiful, being diversified with rolling hills, dense forests of feathery top pines, open glades and park-like views, with now and then a miniature savanna of silvery lakes and rushing streams. The atmosphere is saluhrious and transparent, imparting to the far off peaks a sharp outline and the appearance of close proximity. The greatest collection of natural curiosities of the world has been gathered by nature herself in this National park, lying in Montana and Wyoming Territories.

The Yellowstone lake, a handsome sheet of water, is situated in the southeast corner of the park, at an elevation of 7,788 feet above sea level. Along its southern and eastern shores the mountains present an impressive scene of rugged beauty, being very lofty and abrupt. This lake covers an area of over 200 square miles. Trout are found in great abundance near its outlet, but owing to the juxtaposition of subaqueous geysers they are not edible. Those caught, however, at the head of the lake, where the cold waters come rushing in in the shape of mountain torrents, are good. In the mud volcanoes we see another wonderful freak of nature. Down in these craters the hot mud can be seen thrown in many shapes. After sufficient steam has been generated, a huge mass is thrown several feet in the air, and, falling back into the crater, this action is repeated.

Prominent among the grand views of the Park are the falls of the Yellowstone, which afford a truly magnificent sight. The upper fall is 140 feet high, the grand falls are over 300 feet high, the foaming water rushing over the vertical falls, like a moving stream of snow. The mighty torrent, spanned by a rainbow, descends, with a thundering roar, that can be heard afar off. Below the falls the grand canyon begins, extending thence 20 miles down the river. The walls stand perpendicularly nearly 2,000 feet high. The Mammoth spring, near the northern boundary of the Park, is also a noted place, attracting many visitors by the medicinal properties of its waters. On Specimen mountain some rare curiosities in the way of petrifactions are to be seen, some of them being standing trees, in the cavities of which some brilliant crystallizations are found, fine specimens of banded and clouded agates, opal, chalcedony, carnelian and other rare stones can be picked up *in situ* on this mountain. The National park is destined to become the most famous watering resort of the world. Its mineral waters consist of great diversity, and is infinitesimal and replete. No tourist can ever regret a visit to the great wonderland and for a few weeks consult nature's sanitary domain and witness her grand and unique sceneries.

TAR SPOTS.—Butter will remove tar spots. Soap and water will afterward take out the grease stain.

MECHANICAL PROGRESS.

Krupp's Latest Patent.

The patent for dephosphorating pig iron lately granted to Krupp is hased upon the following: When molten pig iron comes iu contact with basic oxides of iron or mauganeee a reaction takes plaee, in course of which all impurities contained in the iron, as silicium, sulphur, manganese, and especially phosphorue, are separated and converted into slag, the oxygen of the oxides being taken up by the impuritics and their iron being united with the portion treated. By using a mixture of iron and manganese oxides tbe attack of the oxygen npon the carbon of the iron is to some extent prevented and more time afforded for the complete elimination of the impurities mentioned.

The pateuted inveution consists of the use of the reaction described for the purification of pig iron. The latter is, directly from the smelting furnace, conducted into a rotary furnaco lined with a mixture of the oxidee of iron and manganese. In case of neeessity, an additional quantity of these oxides may he added to the metal. The latter ie now for a certain length of time exposed to the action of the oxides. As soon as signs are emitted that the carhon is heing attaeked, the metal is drawn off from the slag formed and may uow at once he worked up into steel or iron, as desired, or cast in ingots for future usc. The fact that a readily flowing iron free from phospborus may be ohiained in this manner is of great importsnce, as quantities as large as five tons may, in tbis case, he operated upon at once. Rotary furnaces of varions construction may he used. The specification nf the patent mentione those of Pernol, Danks, and Godfrey & Howson.

The crude metal is admitted into the rotary furnace, after tho temperature of the latter has been hrought to the melting point of the oxides with which it is lined, and the duration of the operation is from five to fifteen minutes only. The moment at which the oxidee commence to act npon the carhou may be easily determined hy the formation of froth on the eurfaee. The percentage of carbon in the iron is hardly reduced, while in all respects the quality of the iron is greatly improved.—*Deutsche Gewerbe Zeitung.*

A New Locomotive Chimney.

John Baird, chief engineer, and Allan Stirliug, master mechanic, of the Metropolitan Elevated road, have ohtained a patent for improvements in the construction of locomotive chimneys, which they claim will overcome the puffing and roaring incident to the escape of smoke and steam. The devices are an expansion chamher and an annular nozzle placed in the chimney, the effect of which is to prodnee a regular noiseless emission of smoke iustead of an intermittent and sonorous one as at present. The steam from the cylinders instead of passing directly through nozzles is discharged into a chamber of 10 times the capacity of the cylinder, which will allow the steam to expand in volume, and greatly reduce its pressure, so that the noise of puffing will not be heard more than 10 feet away. Mr. Baird claims that this appliance also gives greater speed, with a saving of at least 25% in fuel. He also claims thnt by the application of an English patent the hissing noise of the sndden escape of steam from the brake ejector when trains are approaching a station will be obviated. This improvemcnt consists of a cylindrical chamher with wire gratings at each end, the cylinder being filled with small glass beads, ahout an eighth of an inch in diameter, with a hole in the center. The steam, in passing around and through them, is snb-divided into eo small parts as to utterly destroy its power for producing noise. It requires about 75,000 beads for each cylinder, and the company has already purchased about 800,000 of them. It is estimated that it will reqnire several millions to equip all the locomotives in nse on the road. These novel improvements have been applied to three of the engines, and they will be put on all the engines as eoon as possihle.

Note on Steel Welding.—M. Sergius Kern, M. E., St. Petersbnrg, writes as follows to the *Chemical News:* "In some articles inserted in tbis journal the author statcd that pure steel, nearly free from phosphorus and sulphur and containing from 25% to 30% of carbon, stands easily the process of welding, if, indeed, the work is done with care and by clever workmen. It may he mentioned here that to a steel shipplate, two feet wide and three-eighths of an inch thick, a steel plate (two inchee by two inches by three-eighthe of an inch) was easily welded, and a perfectly clean and good joint was received. In auother caee eteel stripe (eix inchee by four inchee by one-fourth of an inch), containing 25% to 26% of carbon, were welded together; very often after cooling the plate was bent douhle, through the weld, without the least fracture in or near the welded part. In some experimente euch platee were bent at a dark heat, and they often, not alwaye, resisted this severe teet, ae it is known that at this temperature the eteel ie more liable to break. These triale ehow that Ruesian Bessemer steel is of a very good quality."

Barff's New Process for Preserving Iron.

Prof. Barff lately gave a lecture in London on the results nbtained hy his new process since its first announcement, about two years ago, an account of which has already appeared in these colnmns. We clip the following hrief summary of the lecture from the *Scientific American:*

The process consists, in brief, in snbjecting the surface of the iron to the action of superheated steam at a high temperature. The result is the production upon the surface of the iron of a hard, smooth, and durahle skin of black oxide of iron, which preveuts rust far better than any paint, lacquer, rubher, or other compound or procese heretofore known.

Iron articles to he treated by this new process are first cleaned with dilute sulphuric acid, and afterward with bran water. They are then placed within a muffle, the temperature nf which ie 500° or 600° Fah.; dry superheated steam at a temperature of 1,000° Fah. ie admitted, atmospheric air hoing carefully excluded. The formation of the black oxide skin rapidly takes plaeo.

This coating has peculiar properties. It is so hard that it resists emery powder and the file. Many substanceee wbich adhere to ordinary iron will not stick to this prepared iron. For cookery the new process is especially useful. Barff stew pans and other utensils are more cleanly, as arrowroot and other eubstances can he cooked in them and the vessel eleaned with great ease. Barff vessels can he heated red hot without injuring the ekin. Barffed iron is proof against damp, water, hot or cold, aud stands exposure to tbo weather far hetter than galvanized or painted iron. Barffed boiler and ship plates, whether of iron or steel, are superior to all others, as they do not corrode and sediment does not readily adhere. The procese is applicahle to almost every conceivable form of iron manufacture, and appears to be a scientific, important, and valuable contribution to the industrial wants of the world.

The New York Exhibition of 1883.—The committee of citizens having in charge the selection of a site or the locatiou of the World's Fair in 1883, have at last agreed upon a suitable plaee. The committee consists of Jackson S. Schnltz, Orestes Cleveland, Col. Hoe and Messrs. Vanee aud Tiffany. A report is hèing prepared, and will be submitted for publication within a few days. It was resolved at a meeting of the committee that tbe location should not he divulged by any member of the committee previous to the puhlication of the report. It is helieved tbat the site selected is a tract of 170 aeres on Long Island Sound, extending from Port Morris to the Southern Boulevard. The reason of the committee for refusing any information on the subject is their desire to prevent speculators in real estate from taking an unfair ndvantage of the owners of land in the neighhorhood, hy purchase in advanee of the puhlieation of the report.

Usudurian Packing. — The Woonsocket Rubher Company, of New York, are introducing a new steam packing, which they call the Ueudurian Steam Packing, an article made of unvulcanized rubher and other substances. It is a non-conductor, and when subjected to the action of steam it is vulcanized aud cnahled to resist influences which are usually very destructive of ordinery rubher packing. By the application of naphtha to their surfaces, two pieces of the packing may he united and, under pressure, become practicably one, which is a convenience, as the user is thus enahled to huild up any desired thickness of packing.

Railroad Construction in 1878.—The *Railroad Gazette* recently gave a revised and corrected statement of the railway mileage of the United States added during the year 1878, as follows:

Year.	Miles.	Year.	Miles.
1872	7,240	1876	2,450
1873	3,873	1877	2,301
1874	2,025	1878	2,856
1875	1,561		

We have a total of 82,064 miles in the country at the beginning of 1879.

Malleable Cast-Iron.—M. Cordier, of Paris, has taken letters-patent for what is described as an important invention connected with the manufacture of malleable east-iron, "the object of which is to couvert Bassemer metal, and other similar metal, into a special cast metal, particularly applicable for the manufacture of malleable cast-iron. The product is between malleable cast-iron aud ordinary gray pig-iron, and yields an excellent steel by puddling."

Annealing Glass.—A new invention in the process of annealing glass has been patented in France, which consists of first burying the glass when cold in pounded stone, plaster, lime, fire clay, or any eubstance capable of attaining the degree of heat neceesary for the annealing operation, and then raising it to the required temperature. The object of the proces ie to render articlee of glass stronger and more capable of euetaining traneitione of heat and cold.

A number of iron croee-ties have been laid down by the Philadelphia & Reading Railroad Compauy, near the Phœnixville depot, at a point in the road where the traffic is unueually heavy, with the view to their more general introduction, ehould tbey prove to be satisfactory.

SCIENTIFIC PROGRESS.

Photography in Colors.

Many people, latterly, have erroueously given to different eystems of painting on photography the misplaced title "photography in colors." This was too much to say of the ingenious results, some of which were ohtained hy the transparence of the photographic image, some hy other means. Nay, attempts were even made to make us believe that photographic proofs, tinted hy oil or water-colors, were proofs obtained diretly in colors. The only process which, up to the preseut time, has really deserved the name of "photography in colors" is that of M. Ducoe dn Hauron, hut it ie only still in infancy, its practice being very diffieult, and the colors obtained not always heing of the required tone. To arrive at the real colors of natnre is no easy task, but we doubt not that M. Ducos du Hauron will, sooner or later, solve this difficult problem.

M. Germeuil Bonnaud's process of photographing in colors—we use thie term intentionally, becauso it is the only term strictly applicahle—simply consists in causing tho photographic action to operate directly on the color. To this end M. Germeuil Bonnaud has carefully sought the means of rendering a neutral color sensitive, and at the eame time insoluhle, so that it might he able to resist the numerous baths necessary to the photographic process. When this process is used, all the operations remain the same as in the ordinary method, with this great advantage, that the impressions made hy the silver salts on the colored hackground give precisely the effect of the original model, and have not that hardness of tone that generally characterizes a "retouched" photograph. The print comes out of the hath completely colored. Thanks to the chemical agente and the sensitive paper used hy M. Germeuil Bonnaud, the colors and the photograph are henceforward indelihly united. But, in addition to the great artistic results, the material advantages of this discovery are very considerable. Firstly, the true harmony of color is reetored, while prints colored by any of the old processes—photo-painting, as one might call them—are always monotonous and wanting in durability. By oil painting on the photograph, the employment of water-colors, or even of transparent media, the cost of production was immensely increased. And this was not all, hecause to obtain really artistic effects it was necessary to employ artists of such a degree of talent as is rarely found iu country towns, where one does not find every day a Millais, a Dickinson, or a Nadar. Now the photegrapher can do it all himself. So much the hetter for those who are neither painters nor draughtsmen. It appears that the cost of the colored photographs produced by the Germeuil Bonnaud process is very little, if anything, more than the ordinary uncolored ones. So we get at the price of an ordinary carte-de-visite a photograph in nnchangeahle and unfading colors.—*M. K. Versnaeyen, in Scientific American.*

On the Reddening of Carbolic Acid.—Owing to frequent complaints from purchasers and consumers of carholic acid, ahout its aequiring a red color, the firm of Gehe & Co. (of Dresden) have puhlished the following: Many prominent chemists, and all manufacturers of crystallized carbolic acid, have long endeavored to discover the eause of the reddening of pure crystallized white carbolic acid. But in spite of their careful investigations and experiments, the reason still remains unknown. It is inexplicahle why, for instance, a portion of a distillate should remain perfectly white for months, while another portion of the same distillate turns red. Some chemists maintain that this reddening is a characteristic trait of perfectly pure carbolic acid; but thie has not been proven. Whatever may be the cause, it is universally conceded that such colored carbolic acid, provided it has the correct boiling point, is precisely as good as the white, and need not be rejected. The *Phar. Germ.* prescribes that it should melt betwecn 25° and 30° C. (77°—86° F.) but it has generally a high melting point (the *U. S. Ph.* gives the latter between 93° and 106° F.) -No manufacturer can warrant the permanency of the white color of hie carbolic acid.

Constitution of Nebulæ.—In the "Investigations upon the Hight of the Atmosphere and the Constitution of Gasiform Cosmical Bedies," A. Ritter deduces the following law: "If, in consequence of increase or diminution of heat, the radius of the gaseous globe undergoes a change, the temperature of its center also changes; but the product of tbe radius into the central temperature is constant." Since Neptune's orbital radius is about 6,000 times as great as the sun'e present radius, the sun's central temperature is now about 6,000 timee as great ae when, according to the Kant-Laplace hypotheeie, the eun was expanded to the orbit of Neptune. Of the whole work which hae been performed by gravity during that immenee interval, more than four-fifthe ie etill etored within the sun'e mase in the form of heat.

Prof. J. Lawrence Smith finde that the native irone of Greenland are mutually eimilar, and that they differ from the meteoric irone. He thinks it probable that the native iron may have been brought up from below, like the native alloy of platinum and iron.

The Tails of Comets.

Prof. Bredikhine, nf St. Petersburg, writes Mr. Proctor in the Newcastle *Weekly Chronicle*, has made some very interesting researches into the evideuce respecting the tails of comets. He shows reason for believing that these appendages may be divided into three distinct classes, according to the different relatione between the attractive and dispersive power of the sun. The latter power he considers to he, in all probability, modified by the different properties of the particles of wbich the tail is formed. Thcre are few subjects of inquiry more difficult and perplexing than the phenomena of comets' tails. The evidence seems unmistakahly to point in some cases to a true repulsive action excited hy the sun, and yet nothing seems harder to undcrstand thau tho possihility that the sun should exert such a power in so energetic a manner as to produco the atuazingly rapid extensiou of tail matter seen in certain cases. Thus the tail of Newton's comet seen after tho comet had made its nearest approach to the eun, must have heen thrown out in less then a day (probahly in less than a few hours) to a distance of more than ninety millien miles. Under the sun's gravitating power, tromendous though that power appears, the comet, with all the velocity it had already acquired, took more than four weeks in traversing the same distance. Tyndall's ingenious attempt to explain the formation of comets' tails as due to the nctinic encrgy of rays whicb have passed through tho comet'e head, faile to account for the phenomena presented hy many long-tailed comets. Prof. Tait's sea-bird analogy, by which the formation of a comet's tail is compared with the coming into view of a flock of sea-birds, as the plane of their array comee to coincide with the observer's eye, would never have been advanced hy anyone familiar with the hietory of the most important comets, or even with the bistory of any one of the great comets which have heen visihle for more than a few days. What Sir John Herschel wrote more than forty years ago has never yet been invalidated, viz., that the phenomena of comets can only he explained by assuming the existence of an intense repulsive force, excited hy the sun on the thin material raised hy his heat from the surface of comets approaching him from interstellar space.

Solidified Hydrogen.

By the success which has heen obtained in liquefying the gases thus far supposed to he permanent, it appears certain that not only liquefaction, but also solidification has heen achieved.

Pictet, in a very recent experiment with hydrogen compressed at 650 atmospheres, found, on opening the stop-cock, that the gas issued with a noise like that of a hot iron har under water, and it had a eteel-blue color. The jet suddenly became intermittent, and then there followed a sort of hail of the solid particles of hydrogen, which fell with violence on the ground, and produced a crackling noise. Afterward the stop-cock was closed, and there was evidence that a cryetallization of hydrogen took place within the tuhe; hnt when the temperature was again raised, the gae issued as a liquid.

M. Dumas, the President of the French Academy of Sciences, accepts these facts as full of confirmation of the theory long ago advanced that hydrogen is a gaseous metal. As water is an oxide of hydrogen, it follows from this that when a person drinks a glass of water, he imbihes a metallic oxide. *Nature*, in mentioning these performances, coupled with them another, which it regards as yet more remarkable from a scientific point of view. M. Pictet has been able to measure, with a very close approach to accuracy, the volume occupied by a given weight of oxygen in the liquid state. By means of two Nicol prisms, M. Pictet observed the jet of liquid oxygen in polarized light, and found etrong evidence of the presence of solid particles.

As in the chemical nomenclature, the final ending "um" has been adopted for all metals, it is proper to call this metallic hydrogen, "hydrium," a name which has already been used even before hydrogen had been used or liquefied or solidified.

Pteratomus Putnamii, or "Putnam's winged atom," is the very appropriate name given by Prof. Packard to a creature first described by him, and which is probably the emallest of all known insects. An individual of this speciee was captured last summer by Mr. J. D. Cox, who gives a full description of it in the *American Naturalist.*" Its body ie twelve thousandths of an inch in length, the antennæ twenty thousandths. It is probahly an egg-parasite of the leaf-cutter bee.

Telegraphing to Running Trains.—C. M. Gariel deecribee the euccessful working of Baillehache'e invention for eignaling to and from trains in motion, on a part of the line which connects the Champs de Mare with the etation at Grenelle. The experimente were eo euccesseful that they are likely eoon to be repeated on a much larger scale.—*La Nature.*

Another Asteroid Discovered.—C. H. F. Petere, of Hamilton College, Clinton, N. Y., discovered another new aeteroid on the 21et of March. The planet is bright, and of the eleventh magnitude.

TRANSACTIONS in mining stocks are rapidly increasing in New York.

Mining Share Market.

As might be expected from the nature of our peopls and the course of preceding events, the stock market for the greater part of the past week has been in a condition of depression and demoralization. The surprise at the unexpected way in which the election turned, naturally caused stocks to tumble, and the timidity of dealers has, for the most part, kept the markct at a very low ebb. Everybody seemed confused and desirous of holding off till it could be seen how the market would adapt itself to the new order of things. And enrly in the week the uncertainity had the effect of bringing out n largo ins of "shorts."

The panic was further increased hy a lessening of favorahle reports from the Comstocks. On Tuesday, however, a better condition of things prevailed, and the stock people seemed to have again regained their confidence. The stronger tone was particularly evident in the watsr stocks and their neighbors. The north enders also reachcd higher figures, and in many others thsre was a moderately active market. What this change purports it is hard to say. Probahly it ia due to the hetter tone of things heard from the Comstocks, resultiug from "finds" and the approach of the Sutro drain to completion. In nny case the general impression seems to be thnt it is the foundation of a stronger and firmer market somewhere in the near future.

Vulcan Blasting Powder.

The Vulcan Powder Company, of this city, has just issued a little pamphlet devoted to n desoription of their peculiar products, and giving directions for its use. There are three grades made. No. 1 for very hard rock, houlders, iron, etc.; No. 2 for sinking and drifting in medium hard rock, sandstone, limestone, etc.; No. 3, for bench work, pipe clay, cement, soft and shelly rock, quarrying, etc.

We quote the following paragraphs from the pamphlet referred to:

"Prior to the introduction of Vulcnn hlasting powder, the amount of "high grade explosives" used was small compared to the present consumption. This was largely owing to the prices then demanded. Knowing that reasonahle rates for powder would stimulate our mining industries, and, by a reduction in running expenses, encourage the working of many abandoned mines, we have made it our rule to sell as cheaply as possihle; and we claim that it is owing to our efforts that miners can now get better powder for less money than they could four years ago.

"Believing that merit will win, it has been our aim to place on the market the hest powder manufactured in the United State. We have succeeded, nnd are now producing an explosive, in which the following essential qualities are combined:

"1st. Strength.—The various grades of Vulcan are stronger than corresponding grades of other manufacture. Vulcan is the true explosive; every particle exerts force; it contains no inert matter; therefore not an iota of powder is lost. The testimony of those who have used Vulcan substantiates this claim, and we ask consumers to test it for themselves.

"2d. Uniformity.—It is a matter of great importance to miners, that the powder they use should he uniform in quality, and reliable. Our process of manufacture is so systematized that Vulcan powder is always of uniform strength.

"3d. Snfety.—Vulcnn powder is strongly recommended for its safety in transit, storage and manipulation.

"4th. Freedom from Fumes.—The ahsorbent used in Vulcan powder is completely decomposed hy its explosion; the smoke passes off quickly, and miners can then resume work without experiencing the unpleasant sensations customary with other "high explosives." In the manufacture of the latter, a non-explosive absorhent is employed; and consequently, after a blast, the air is filled with the minute particles of this neutral absorbent. This dust catches the fumes from the explosion, and holds them in suspension for a long time; hence the headache and nausea caused by the sickening and noxious fumes peculiar to these imperfect powders.

"5th. Cheapness.—The Vulcan Powder Co., largely composed of consumers of hlasting powders, has been appropriately called the Consumers' Company. Such heing the case, and since our business is conducted economically as well as systematically, we defy competition."

The pamphlet may he ohtained from the Vulcan Powder Company, No. 123 California street, in this city.

Bullion Shipments.

Since our last issue, we havo noticed the following bullion shipments:

Ophir, May 9th, $42,109.14; Standard Con., May 10th, $29,248.92; Paradise Valley, May 9th, $3,831.06; Christy Con., May 19th, $5,290.

ONE HUNDRED striking miners stopped work at Elrich & Co.'s mine, Indiana, and heing nearly famished devoured the contents of the miners' lunch baskets.

Mining Summary.

The following is mostly condensed from journals published in the Interior, in proximity to the mines mentioned.

CALIFORNIA.

ALPINE.

ILLINOIS CALIFORNIA.—*Signal*, May 7: Operations have been suspended on this mine. Messrs. Bunt and Riley have completed their contract, running several inches more than was required by the agreement. The rock in the face of the tunnel is quite soft, with more or less water, which, taking into consideration the charsrter of the rock passed through, and absence of water, is thought to be an excellent indication of the close proximity of the ledge. Mr. Bunt thinks that if the ledge has not been cut or slid off, that it certainly should be found in 50 ft.

AMADOR.

GOOD PROSPECT.—*Dispatch*, May 10: Messrs. Lorraine and Marshall have commenced taking rock from a ledge they discovered near Jackson Gate, which shows very flattering indications. Free gold can be seen scattered through it in abundance. The rock, it is calculated, will yield at least $60 per ton. The ledge varies from one and a half to four ft wide.

SUTTER CREEK.—A fresh recruit of miners have been set to work on the Mahoney mine, and things thereabouts are assuming a lively, business-like aspect. They propose to sink a perpendicular shaft to the depth of 1,000 ft, and it is thought that it will take about a year to complete it. The new hoisting works at the Amador mine are nearly completed, and it is expected that they will got steam up about the last of the present month.

CALAVERAS.

SHEEP RANCH.—*Chronicle*, May 10: The mine which was formerly the Ferguson & Wallace, Mr. William Clary Superintendent, gives employment to about 80 men. The machinery is in charge of Mr. B. F. Howard, who is chief engineer and machinest. The mill has 20 stamps and all the modern improvements for extracting the precious stuff from the rock. The hoisting works are some 180 ft from this mill, and as the rock is hoisted from ths shaft it is run by car to the stamps. The shaft is 300 ft in depth, with rich rock at the bottom. Ths drilling in the mine is done to a great extont by ono of Ingersoll's compressed air drills.

GOLDEN STATE COPPER MINE.—This mino is seven miles west of Copperopolis, one and a half miles east of Telegraph City, located on Sheelay gulch. This property is owned by parties residing at Live Oaks, San Joaquin county. The mine is under the superintendency of Mr Oxeudine. At present it is looking well. A two-ft veinat a depth of 50 ft. Sbipments of ore to Milton will be made soon.

GWIN MINE.—Work at the Gwin mine, despite the large amount of water encountered, is progressing favorably. The Alexander shaft is being put down as fast as possible, and the ore mined is fully up to the standard of good milling rock. The completion of the Alexander shaft will put the mine in better condition for working to advantage than ever before and greatly lessen the difficnlty now experienced from an sxcess of water.

DEL NORTE.

QUARTZ MINING.—A company has been formed for the purpose of working a gold-bearing quartz ledga in the Bald hills, situated about 14 miles from Crescent City. Tho quartz is said to be very rich with gold, and it is thought will prove a bonanza to its owners when properly daveloped.

INYO.

MODOCK.—*Independent*, May 3: Tunuel, 1000 level, run 48 ft, making total length 1,528 ft. Shaft from 300 level sunk 13 ft, it being now down 301 ft. Upraise from 1000 level raised 10 ft; present hight of raisc, 112 ft. Distance betwesn bottom of sbaft and top of raise, 75 ft. From present appearances, the connection should be made in three weeks, or four at tho outside, when prospecting veln matter passed through in the tunnsl can bs begun at once. Ground in face of tunnel continues the same. Easy-breaking white lime, such as is found next to oreground in East Confidence upper level. Work for the past week has made good headway at all points.

NEW COSO.—The New Coso furnace at Darwin is receiving ore from ths Modock, Minnietta and Custer. A lot of 12 tons more is to go from the Ygnacio. Bolsy & Tuttls have from 10 to 12 tons of their rich ore, whieh Mr. Woodhull, of this point, is to go down and attend to the sampling, assaying, etc., for the owners.

CLEAN UP.—The Mammoth mill, at Lake, after a run of 22 days, bagan a clean-up and expected to make its first shipment of gold, amountin; to $100,000.

A LAROS LEDGE.—Mr. S. A. Deusmore lately brought in some very fine-looking specimens of rich base-metal ore from a new discovery of his near the summit of Inyo range. Thera is a solid ledge seven ft in widtb, tho ore carrying about 60 ounces of silver per ton.

MONO.

CON. PACIFIC.—Bodie *Standard*, May 9: A rich strike has been made in Con. Pacific, a mining enterprise located on the western brow of Bodis bluff, or rather High peak, nndsr which the rich chimneys of the Bulwar, etc., ars found. The winze on ledga No. 2 was sunk to a depth of 132½ ft below the old tunnel on line of ledge, or a depth of about 160 ft from the surface. At this point a crosscut was run east a distanec of 36 ft for tha purpose of tapping ledge No. 1. Thls crosscut was a complete success, for the ledge was cut and found to be upwards of 20 inches in width and quite rich, free gold being visible in the ore at a number of placss. Ths fissure is perfectly defined and the filling of ore decomposed and easily separated and extracted. This ledge was crosscut from the above-mentioned tunnel, where it resembles in extent and character that below, but is less decomposed and rich. Ledge No. 2 more than held its own all the way down the winze, having a width of from 18 inches upwards, and the ore getting richer with depth. Both ledges dip to the east. This givss the company two "backs" of 150 ft hight each, and 200 ft in length at least, of an excellent grade of milling ore. It is proposed to sink a winze on ledge No. 1, at the point where recently crosscut, and to a depth equal to that on No. 2. This work will develop the north end of tbe claim to a depth of 300 ft, or perhaps to a level with ths Bulwer tunnel, which will pass through the ground a convenient distanes north of tha winze. At a more soutberly portion of the claim, or about 500 ft from the winzes, a main working shaft, double compartment and well timbered, is down 220 ft. It is to ba sunk to 250 ft before crosscutting will bs inaugurated. In the meantime, hoisting works are contemplated. This shaft already promises interesting developments, as quartz is coming in, with an eastern pitch, that assays in gold. This was observed at a depth of 210 ft, where the cap rock or looss formation was passed through. This shaft is judiciously located on tbe bench west of the Bodis, whera the latter struck it so rich. Tbs claim is 300 by 1,400 ft in dimsnsions; title perfect.

THE SYNDICATE.—The quartz indications have been gathering force, until a ledge about 10 inches in thickness has formed of a grade that would well pay to mill, according to every test applied, with more stringers and every feature of the formation tending to tho belief that a very important development is not far distant. The water is still strong and suggestiva of a permanent ledga of no small proportions somewhere in tha neighborhood. The ledge, stringers and incasing rock dip to the west at an angle of about 60°. Tha beader of tha tunnel is about under the crest of Bodie bluff, or 700 ft from the surface. This showing of quartz seems to come up deep from the south, the tunnel running in under it.

STANDARD.—The most gratifying development in the Standard claim is the showing of tbe old lode north from the new works. The ledge is drifted on toward the north line, a distance of 170 ft; it dips very flat to the west, and corresponding to that between the 550 and 650 levels in old incline. The ore body has been widening very materially for over 100 ft in drift, and is now all but six ft in width of clean vein matter that will mill over $100 per ton. Walls perfect. An upraise to connect with old works is in 40 ft. An east crosscut from the north drift in 63 ft; cut an 18-inch ledge of good ore. Winze on the Cook or Burgess ledge is down 40 ft, and in ore of high grade. The drift on the Gilden ledge is 140 ft in length, and in same clean vein as usual. The crosscuts east and west on the 700 level are respectively extended over 70 and 90 ft; generally hard ground. Stringers of quartz are also a feature. In the old works, above the 200 level, a great quantity of ore is being laid bare, and in the crosscut east, 300 level, new ground of importance is developing between Standard and Summit.

BULWER.—Drifting on tha Stonewall, 400 level, is north 53 ft; south 43 ft. Ledge broken, but less so than heretofore. From drifts above, ore is being obtained to supply the Bodie mill; main drift south, 400 level, on the Ralston, now near 500 ft in length all the way in ore, is still being extended.

NEVADA.

PLACER NOTES.—*Transcript*, May 10: Tha Polar Star and Southern Cross have never yielded better than this season. The Polar Star has now dirt capable of yielding $1,000 for 24 hours' run. The two claims employ 35 white men or more, at $2.50 a day. The clean-up in the Franklin, though not as good as reported, is still encouraging, and the company have determined to prepare the mine for drifting after tho water ceases. It is their intention to run a drift entirely through their ground for drift dirt during the summer. The Central, owned by the Cedar Creek Co., recently gave quite a handsome clean-up. The company have a full quantity of hands at work night and day. At little York they use two pipes with 3,000 inches of water, employing 23 white men and about the same number of Chinese. At Christmas Hill, four white men and eight Chinese. At Liberty Hill, 15 white men and 5 Chinese. Mr. Morgan anticipates water for the usual length of time, and regards his prospects all around as very flattering this season. The mines at You Bet are also yielding well this season. Tha Hussey, worked for 20 years, never paid better. Only one pipe carrying 450 inches of water is used here. The Nevada mines, owned by Mr. Hayward, at You Bet, are giving large returns. Four claims are run in this property, employing 36 white men, and a few Chinamen being hired only in one of the four, on account of the return of the work. They use 2,400 inches of water, with a bank 130 ft deep, and have water all the year. The surface dirt will last five or six years yet. The Bird's-eye Creek mining company, owned by the English company, gives the same flattering account. Forty white men are employed there, with some Chinese. Two thousand inches of water at used, which Mr. Powers calculates will hold out until the 1st of September. Wages through this section range from $2.50 to $3 a day. At Mr. Hayward's mine, the hands are boarded at a charge of six bits a day per man. The decision against the mines obtained in the late debris trial at Marysville, will not be enforced this season, if the owners of ths mines involved use all diligenca in bringing the case before the Supreme Court. The only claim in Shady Run working at present is the Live Yankes. The owners are now drifting parallel with the channel and getting good pay. At Blue Canyon, only the Hartnell hydraulic mine is at work. The owner reports good returns.

THE KENTON MINE.—The prospects of tbe Kenton quartz mine, near Alleghany City, Sierra county, are daily improving. An extensive body of rich ore is developed and ready for extraction. Over 1,000 tons is now in sight in the mine. The taking out and crushing has now been going on for saveral weeks, and with highly favorable results. There is sufficient water to run all the machinery, and the expenss is consequently light. About 20 skilled miners are now employed at the Kenton, besides a considerable force of other workmen.

PLACER.

THE FRANKLIN.—Dutch Flat *Forum*, May 8: The Franklin Gravel mining company, of this place, are running powder drifts and fitting their claim preparatory for another run under ths supervision of E. Miner. They will burn 9,000 pounds of Judson powder the latter part of this week. The gravel looks well in this mine, and good results are anticipated from this run.

THE MOUNTAIN CHIEF.—*Herald*, May 10: Tbis is the name of a new mine that is being developed on the Forest hill divide, near the Sugar Pine mill. From prospects heretofore made, and other indications, thera is supposed to be an immense gravel channsl, rich in gold, lying under the ridge, and crossing in the vicinity of the Sugar Pine mill. With tho views of prospecting for this channel, a number of local capitalists and miners associated themselves together some time ago, and commenced operations. They gave to their mine the name, Mountain Chief. The company consists of J. B. Seller, M. Hoffman, D. Bowers, F. Outhouse, John Beckstrom, Gso. Hfill and Wm. Smith. The immensity of the channel known to underlie the location attracts much interest to their enterprise. If they find ths gravel as rich as expected, there are millions of money, we are told, ready to be invested in that section at once. They are now down on their lueline about 330 ft, and tho indications at that depth ars very favorabls.

SHASTA.

HOLCOMB'S.—Cor. *Independent*, May 8: Mr. Holcomb had rock assayed from three different ledges, with the following result, per ton: The first croppings in gold, $78; the second, four ft from the surface, in copper, $33 and silver, $2.72; the third cropping, in copper, $23. Mr. Holcomb has what he supposes to be a deposit of cinnabar, in a cut about 15 ft deep. Ths rock (apparently a ledge) is of a dark red color, dotted with small dots of light red, resembling the color of the vermilion of commerce. The rock apparently is seamy, and on being separated, the parts are found to ba coated with a very thin coating of a minsral resembling in color sulphuret of mercury. The bank over this ledge is of a red color tinged with purple. Through small fissures in ths rock and bank issues a soft white substance, which resembles yellow, in feel, and on which fire has the same effect as upon ordiuary rock.

SIERRA.

A RICH STRIKE.—Downieville *Messenger*, May 3: A rich deposit of gravel has recently been discovered, or rather stumbled on, in Howland Flat, that bids fair to rival in extent of product, anything that has hitherto been developed on the famous Blue Lead. A few weeks since, a couple of enterprising mining sxperts, Conroy and Kelly, started to prospect the locality of Bull's Run, where by perseverance and industry, they have succeeded in finding a valuable piecs of mining ground, that had by soms chance escaped the notice of all former prospectors. While tracing the course of a stream of pay gravel, found upon the edge of the ravine, they discovered a "blind channel," and upon prospecting, they discovered an immense deposit of pay gravel.

NEVADA.

WASHOE DISTRICT.

UNION CON.—Gold Hill *News*, May 13: The north drift, 2000 level, is now in 270 ft from tha sonth line, the face in hard blasting porphyry. The drift running south on the 2300 level from the 2200 level of tha Sierra Nevada incline is now 122 ft in and continues to cut a vein formation carrying streaks of clay.

SIERRA NEVADA.—The incline has still 30 ft to go to reach the 2400 level, and will then ba continued for a sump. The water continuos strong, but is well handled by the pumps. The work of extracting ore on the 2200 level has been commeneed, and soon the average amount taken out will be 70 tons per day. What ora is taken out is being stored at the Mariposa mill, which will be set to crushing it as soon a sufficiant amount has accumulated to insure it steady work.

JUSTICE.—The drift, 1300 level, along the west wall is being continued and is opening up a formation of exceeding promise, the quartz seams being stronger and the ore bunches larger and richer than in the crosscut leading in.

CON. IMPERIAL.—The new air compressor is in place and working well, and work has been resumsd throughout the mine. The Alpha joint winze is being continued on down, the engine there having been altered to a counterbalance.

MEXICAN.—The joint Union winze from the 1600 level is making slow progress on account of the clayey nature of the vein material ancountered and water flowing in. The drift, 2000 level, connecting the top of the joint Ophir upraise with the main north drift, has been enlarged and timbered, rendering ventilation in that part of the mine much better.

SAVAGE.—The work of retimbering the incline and of repairing the north lateral drift, 1600 level, is going on as usual. The water is now about 65 ft on the incline below where it originally stood.

SUTRO TUNNEL.—Work has been commenced on the subdrain as far up as the Julia branch. There are now 1200 men employed, and the tunnel will be ready about the middle of June.

BELCHER.—The south drift, 2500 level, is averaging four ft per day, its face in porphyry, clay and quartz, 413 ft from the incline. The mass of clay and quartz mixed which is encountered in this part of the mine is greatly in excess of anything ever found before on the west side of the vein. The crosscut, 2300 level, on the south line has penetrated quartz a distance of 30 ft, average assays from which are $7.

JULIA CON.—Owing to the bursting of the water cylindor in the No. 9 Knowles pump on the 2000 level, allowing that to be flooded, nothing has been since done toward repairing the broken drifts. The water was, however, cleaned out and work resumed.

BEST & BELCHER.—The joint east crosscut, 1700 level, is now in 832 ft, the face in a soft vein formation of porphyry and clay, which requires close timbering. The drain tunnel connected Saturday after having run 400 ft.

NORTH STAR, VIRGINIA.—Sinking is going on as usual, the bottom of the shaft being 32 ft below the 1700 level and in hard blasting porphyry.

SILVER HILL.—The incline has reached the 1300 level and will be continued 40 ft further for a sump. Workings from the south drift from the new Waller Defeat shaft are being prosecuted, and have encountered six ft of low-grade ore, which will pay to extract and mill.

CROWN POINT.—Drifting north, 2500 level, crosscutting joint with Belcher on the same level and 127 ft further north, and sinking the winze from the 2500 level.

OVERMAN.—The winze below the 1000 level is being continued as usual. In the north drift, same level, the time has been spent of late in putting in a drain.

YELLOW JACKET.—Ths new shaft is averaging four and one-half ft per day in increasod depth, and is now down 2,514 ft. A drift has been started from the 2500 station to meet that running toward the shaft on the 2400 level of the old works and has been advanced 40 ft.

CON. VIRGINIA.—The repairs to the machinery, etc., of the C & C shaft have been completed, and active operations have been transferred to it from the Consolidated shaft, exeopt on the 850 and 1500 levels. Work has accordingly been resumed in the south drift, 2150 level, in joint winze No. 3, 1950 level.

ALTA.—The station at the 1750 level of the joint Benton incline winze is being opened up. Ths timbers of the north drift, 1550 level, into Benton ground, are still being eased. This work will be completed the first of the coming week.

CALIFORNIA.—The joint west drift, 850 level, is averaging four and one-half ft per day in a formation changing from porphyry to vein material; total length, 155 ft. Joint crosscut No. 1, 1850 level, has been started up again. It is being run west from a point 102 ft south of winze No. 3.

UTAH.—Sinking is going on in the inclins, the bottom being in a harder and better formation, so that it is no longer necessary to drive lagging ahead. Tha water is about the same. Total depth of the incline, 495 ft on the stops below the 1350 level.

OPHIR.—A drift has been started north from the bottom of No. 1 winze from the 2000 to the 2100 level, and is following the ore vein in that direction. The drift south from the same point is in 68 ft, and still shows good ore in the face. The drift on the 2000 level, connecting the top of the joint Mexican upraise with main north drift, has been enlarged and completed, improving ventilation materially.

GOULD & CURRY.—The joint east crosscut, 1700 level, is averaging four ft per day through a mixturs of soft porphyry and clay, which requires it to be closely timbered. This drain tunnel was connected with tbe shaft last Saturday. Its total length is 400 ft, and its point of intersection 140 ft from the surfacs.

HALE & NORCROSS.—The new lightning drift, 1620 level, to connect with the Julia branch of the Sutro tunnel, is averaging 12 ft per day, and is now in 108 ft. Tbe water stands 65 ft below its old level, which was 47 ft below the 1700 level. It is still raising slowly.

NORTH BONANZA AND FLOWERY.—The north drift on the 200 level is averaging five ft per day. Work has been resumed in both the north and south drifts, 300 level, and both are making good progress.

BULLION.—A blower and engine are being put in on the 1350 level—the 1700 level of the Imperial—to furnish air to the lower levels of tha mine.

WARD.—Sinking is making usual progress. The bottom of the shaft has of late encountered some fine-looking stringers of quartz, carrying a large proportion of iron pyrites.

LADY BRYAN.—The shaft is nearing the 750 level and is without material change. The drifts north and south, 600 level, are in fine-looking quartz giving low assays.

SUCCOR.—Tbe drift north, 1100 level, continues to cut a very promising vein formation containing some fine-looking quartz, yielding low assays.

ANDES.—The upraise from the 350 level has reached the level above, and ths work of clearing out preparatory to prospecting has been begun. A new upralsa has been started some 250 or 300 ft further north.

EXCHEQUER.—The Imperial air compressor having been placed in position, work has been resumed in the 2400 north drift. Ths face is in a fine formation of porphyry, carrying streaks of quartz.

CALEDONIA.—Work in the winze has been interfered with of late by the cutting out of a station in the side of ths drift, 1600 level, to put in a blower.

MT. HOOD & VANCOUVER.—Good progress is being made in extending the drift, 1400 level. The face is now 150 ft from the shaft, and in hard, blasting rock.

BELMONT DISTRICT.

BELMONT.—*Courier*, May 10: The prospects of the mine are without change. During the week have advanced east drift from winze 14 ft, west one 10 ft, both of which are showing good milling ore. Tbey will commence to take out ore from west side of winzs tbis coming week. The 300 level drift from shaft is looking more promising every day. Have made 22 ft on same level from south raise—have made slow progress as ground is hard and air bad. Will take at least two weeks more to make a connection.

HOUSEBRIDGE.—Have finished sump and are crosscutting ledge on 6th level 70 and 140 ft south of shaft. Have not done enough work to determine how much ore the ledge carries at thase points. Will soon resume extending northb drift on 7th level. They are now hoisting sufficient watsr to run the hoisting works.

EUREKA DISTRICT.

EUREKA CON.—*Sentinel*, May 11: There is no particular change to note in tha condition of tbo mine. The following work has been done in the several levels: 5th, east drift has been continued 24 ft, and is now in 67 ft; 7th, started a drift running northwest, and made 24 ft; 13th, east drift has been continued 23 ft, and is now in 39 ft. The west drift has been continued 18 ft, and is now in 47 ft. The incline has been sunk 22 ft, and is now down 62 ft below tha station.

HAMBURG.—East crosscut on 000 level is now in 33 ft, following a cross vein or seam of ore. The entire crosscut is in favorable vein matter. South drift from the west crosscut on the same leval was advanced 10 ft along

[Continued on Page 324.]

Practical Divisibility of the Electric Light.—No. 1.

A paper, by E. J. Molera and J. C. Cebrian, read before the California Academy of Sciences, April 21st, 1879.

We wish to communicate to this academy our new system of the economical division and distribution of light in general, for its application to all purposes of lighting, both public and private; being a practical solution to that great desideratum, the

Divisibility of the Electric Light.

In the last few years the *electric light* has asserted its own prominent placo before the world, and its great advantages begin to be generally acknowledged; the methods to produce it have attained the necessary perfection to be practical to a large extent, as we find it now successfully used in the lighting of large spaces, such as theaters, factories, railroad depots, stores, lighthouses, government buildings and similar places.

The superiority of the electric light upon any other is of various kinds: Examined by the spectroscope it is found to be nearly equal to sunlight; it does not alter the natural color of objects, is soft, white and brilliant; whereas *gaslight* is of a dirty yellowish color, tiresome to the eye, and alters the natural color of objects.

Then electric light irradiates almost no heat; whereas the heat emitted by gas flames is universally recognized as uncomfortable and very unhealthy.

Moreover, the electric light requires no air to sustain it; whereas gaslight, like all others produced by combustion in the open air, vitiates or poisons the atmosphere, because it consumes the oxygen therof and emits instead the foul products of comhustion, among which are sulphuric acid and sulphurous acid. And it is well proven that an ordinary gas-burner vitiates as much air as four grown persons do.

Again, electric light is odorless, whilst the peculiar fetid odor of gas and gaslight is uncomfortable and unhealthy.

Electric light is not liable to explosions as the gaslight is, nor does it require the expensive, disagreeable and prolonged repairs so often recurring in the gas system.

Finally, electric light is, in fact, far cheaper than gaslight, whenever produced and consnmed in large quantities. If we were to build a complete gas factory for each dwelling or building in a city, the cost of gaslight would be enormous. Yet, such has been the case with the trials of the electric light, which have given the wrong idea of its excessive eost, produced for a single huilding. Electric light has been compared with the price of gas when produced for a whole city, and even thus, in some cases it has proved to he the cheapest.

To show which is in general the relative cost price of electric light and gaslight, we will substitute the price of every item composing the cost of light, in each system, for an amount of coal of an approximately equal price, and we will obtain the value of light irrespectively of the local prices of tbe items. Some dynamo-electric machines produce light at the rate of 6,000 candles per horse power spent. One horse-power consumee from two to seven pounds of coal per hour—to make allowances, let us call it six pounds; the incidental expenses and the repairs of the steam engine, we will put at one-quarter the value of fuel, which is excessive, one and a half pounds; the attendance of the steam engine will certainly not cost more than one-half the value of fuel, three pounds; the expense for carbon points in the latest trials has been only one-half of the value of fuel, three pounds; the incidental expenses and repairs for the electric machines, we will put like those of the steam engine, one and a half pounds; and the attendance of the electric apparatus will certainly cost less than those of the steam engine; but we will call it like tbat, three pounds; in all 18 pounds; add 10% for contingencies, and the result is that 6,000 candles for one hour of electric light, will cost as much as 20 pounds of coal.

Now, in gae making, one ton of coal gives as an average, 9,000 cubic feet of gas; the cost of lime and labor is not less than one-third the cost of coal, or, in our case, 750 pounds, which, added to the ton, make 3,000 pounds of coal. Supposing, now, that the residue of gas making is merchautable to the extent of 40% of the ahove, which is a very favorable case, we obtain as the cost of 9,000 feet of gas equal to the cost of 1,800 pounds of coal. Hence, one pound of coal ie equivalent in cost to five feet of gas, or an ordinary burner of 15 candles in one hour; hence, 400 pounde of coal represent the cost price of 6,000 candles of gaslight in one hour; and, consequently,

$$\frac{\text{Cost price of gaslight}}{\text{Cost price of electric light}} = \frac{400}{20} = \frac{20}{1},$$

or the mere production of the electric light, irrespective of distribution, is not more than the one-twentieth part of the cost of gaslight. The practical application of the electric light in several countries shows that this is near the truth. The most etriking iustance of this fact is the recent trial made in Alhert hall, in London. They used four of the smallest Siemens machines, and four of the Jablochkoff candles at the orchestra. Let it be observed that theee circumstancee were very unfavorable. In the first place, they used small-sized machinery of a capacity of 2,000 candles per horse power, whoreas other larger machines give up to 6,000 candles per horse power; in the seoond place the light wae needed only three hours, and fully one extra hour was spent to put up steam and down the fires; therefore the fuel was wasted 30% above the time needed; in the third place the attendants' wages were paid as a full day's work for only three hours' use. Yet the actual expense of every item, *plus* a liheral allowance for wear and tear, amounted, for that night, to $12.50, having the lighting proved a complete and satisfactory success. In former occasions, the gas bill for the same building and for the same length of time had been (at the low price of London gas) $36.50; very nearly three times as much as the former figure. If we take San Francisco prices for every item, the ahove prices would stand thus: Cost of electric light, $27.50; cost of gaslight, $126; nearly five times as much. If the light had been needed six hours instead of three, the figures would be as follows: Cost of electric light, $39.00; cost of gaslight, $252, or six and a half times as much. We will add this single item: that the cost of instalation of the electric light for that building was $4,000, which is much less than the price of gas-pipes and gas-fixtures of the same building.

The Difficulty.

But although having so many great advantages, the great difficulty with the electric light has been, how to handle it, how to apply it in practice, after the light is produced. All the methods or systems of electric lighting heretofore proposed may be divided into two classes: 1st class. Those that use a few numher of strong lights. 2d class. Those that use a large number of small lights. The strong lights are the cheapest, as demonstrated by practice. While a generator of eleetricity having a capacity of 4,000 candles, requires an expenditure of one horse-power for every 1,500 candles, a generator having a capacity of 30,000 or 40,000 candles, will produce light at the rate of over 3,000 candles per horse power; and iu ease of a higher capacity the production attaius a rate of 6,000 candles per horse power, as said before. But a powerful light of 60,000 candles for instance, cannot be properly used in general; it is too powerful for a small place, and even for a very large place; a number of smaller lights regularly distributed will give a much more efficient illumination. The use therefore of strong lights is very limited in practice.

Consequently the attention has been turned to the second class of illumination; and, having failed in building a machine that would produce a small electric light, at the same cheap rate of a powerful machine, all the endeavors have been directed to the economical subdivision of a powerful electric current into small currents that would produce small lights. All such attempts have been failures, because according to known electrical laws, corroborated by practice, whenever an electric current is subdivided, the light-giving power of each secondary current is smaller than inversely proportional to the square of the number of the sub-currents. For instance, a light of 40,000 candle-power divided into 100 lights, will give 100 lights of four candle-power each, or 400 candles in all; this is a loss of 99%; if the number of smaller lights increases fivefold, the loss will amount to 998 per thousand, and so on.

This evidently places this second class of electric lighting altogether out of any practical application.

Division by Optical Contrivances.

In order to avoid dealing with that electrical law, we were led to try the division of the light itself, leaving the electric current untouched. The result has been our system, in which we only use *optical* means or coutrivances, and it can therefore he applied to the electric light, as well as to any other kind of light.

We take the most powerful source of light obtainable, and place it in a closed chamber or box, called the *chamber of light*. Every wall or face of this box is a condensing lens or a combination of lenses, such that will ehape the light into a beam of parallel rays; some of the walls or faces may be only reflectors, throwing the light upon some of the condensiug lenses. For instance the wall or face holding the stand of the light, will be a reflector.

In thie way, we reduce our source of light to several beams of parallel rays, without the emallest stray ray of light being lost.

When light is not condensed, the intensity thereof is inversely proportional to the equare of the distance from the light, because light is then diffused equally iu all directions around its focus. But when light is condensed, as above said, its intensity along the etraight line of the heam remains unaltered, except a small loes hy diffueion, which for a short distance is small. Therefore our chamber of light permits to send light from one place to another without appreciable loss.

If we intercept one of these beams of parallel rays of light by a reflector, the light will be bent or reflected according to the poeition of the reflector; and it may thus be sent into any desired direction, horizontal, vertical or any way inclined. When the reflector intersects the whole beam of light, this latter one will be bent totally; if only one fraction of the sectional area of said beam is intersected, then the corresponding fractional part of the beam will be bent, leaving the other fraction thereof to follow ite former direction. Therefore, if one of said beams of light is intersected at different poiuts of its length, by different reflectors, intersecting different fractional parts of its section, said beam will be divided into a great number of secondary beame, going into any desired direction, and if these secondary beams are treated in the eame way, tbe main beam can be divided, subdivided, conveyed and distributed to any number of dietant places. If we inelose the main beam in a tube or pipe, and every secondary beam in smaller tubes, branching out from the larger one adjoining it, and we keep the above said reflectors at the elbows and intersections, or T pieces, formed by all tbese tubes, wc will obtain a net or system of pipes or tubes similar to those used in the distribution of gas and water.

Such is onr system: in front of every side or face of our *chamber of light*, we place a box or pipe enclosing the main beams of light; these pipes are laid along the streets; at every side street a smaller pipe will branch out from the main one; at their junction we will place a reflector which will divert into the side street the desired percentage of light. And thus we can provide every street of a city with one or more pipes carrying a known amount of light. Then, from said street pipes, service pipes will be run into every lamp-post and every building, and at the intersection of the latter pipes with the street main we will insert proper reflectors, the size of which will determine the amount of light supplied by every service pipe. In the same way that at present the gas buruers of all the rooms in a house are in direct successive communication with the gas meter or service pipe, for said house, through a net of pipes laid along ceilings and walls; similarly in our system, a net of properly branched out pipes will put in communication every room of a huilding with the above mentioned service pipe; only that we will place at every junction, occurring in said net of pipes, a proper reflector, which will determine the amount of light carried by the corresponding pipe. Thus, the light may come into the rooms through the ceiling or through the walls, every room having as many outlets of light as desired. But the light will enter in a beam of parallel rays; therefore, in order to properly shape it for use, we will place at every outlet of light a *diffusing lens*, called a *secondary lens*, wbich will send the light around in any predetermined shape; thus completing the system of division and distribution of light from a single statiou to any or all the rooms in a city, and with any desired intensity.

Our system allows to control the light in three ways, to wit.: 1st, in its iutensity; 2d, in its shape; 3d, iu its chemical and physical properties.

1ts.—Control of the Intensity of Light.

If the reflectors in the pipes are stationary, the amount of light in every pipe will he constant, as loug as the intensity of the original focus of light remains unaltered; but if said reflectors are made movable, we can control the supply of every pipe, or every set of pipes, at will, by making said reflectors to intersect a larger or a smaller portion of the next preceding beam of light. Therefore the last reflector for every outlet of light will do the same service as the gas keys now in use; because its sliding motion will allow the light to enter the room in more or less quantity, down to a mere glimmer, if so wished. Another way to control the intensity of the light in a room, is by means of a contracting or sliding diaphragm or screen, placed near the outlet of light, and provided with any controlling mechanism which will allow the whole ray of light, or only a part thereof to enter the room.

One of the great advautages of our system consists in the interdependent control of light of several rooms. To illustrate it, suppose we have three adjoining rooms with a common supply pipe; suppose the reflector of the first room intersects the lower third of said pipe, the reflector of the second room intersects the two lower thirds of the same pipe, and the reflector of the third room embraces the whole section of the same pipe. In that way, every room will receive one-third of the whole light in said pipe. Now if we slide the first reflector inside of the two lower thirds of the supply pipe, the intensity of light in the first room will vary at the expense of the second room, aud *vice-versa*; if we slido said first reflector into the upper third of the supply pipe, the iutensity of the first room will vary at the expense of the other two rooms. Likewise, if we leave the first reflector as at the heginning, and then we slide the second reflector inside of the two upper thirds of the pipe, the intensity of the second room will vary at the expense of the third room and *vice-versa*, leaving tbat of the first room unaltered. Finally, if we slide the first and second reflectors in perfectly parallel uniform motion, the intensity of the second room will be constant, and that of the first room will vary at the expense of the third room, and *vice-versa*. What we have said of three rooms, may as well be said of any number of roome, and also of auy number of floors in a building. Therefore our reflectore allow to shift the light from one room into any other in the same building, in whole or in part, with perfect accuracy and simplicity.

Thie introduces an element of great economy for household purposes. Were it not for this circumstance, every house lighted by our system would have to get a constant supply of light for every room and place to be lighted, whetber the places were in constant use or not; and as not all the rooms in a house are used at the same time, such an arrangement would be very wasteful, which is the case with all the other systems of electric lighting yet proposed.

2d.—Control of the Shape of Light.

The secondary lenses above mentioned will control by their shape and position the ehape of the light. If the light comes from tho ceiling and a diffusing lens is used, it will send down a cone of light extending all over the floor, for instance: if the curvature of the lens were different, said cone might be made wider, so as to illuminate the walls as high as desired, and the ceiling too; or it might be made narrower and the light be concentrated upon a work table, a sewing machine, a writing desk, etc. At present a room may be lighted with 1 or 2 gas burners of 15 candle power each; and yet, they often are insufficient to read or write by; either you have to get with chair and desk near the burner, or you have to use shades, reflectors, drop lights or some inferior kind of light upon your table. But, iu our system, by properly swinging the secondary lens, we can throw the cone of light to any desired place in the room where it is needed; and by this means, 8 or 10 candle power in our system will, iu most cases, he more serviceable than 15 or 30 candle power is with the present system of light, or in any of the electrical systems heretofore proposed. By the same means the cone of light may be thrown away from any place where it is not needed, as from a sick hedstead for instance.

This circumstance also increases the range of utility or adaptability of light to many especial purposes without expense or trouhle. Because hy using a proper lens we can project the whole amount of light into a point, if so needed, thus affording the microseopist, for instance, a powerful aid in his work. The physician also can perform medical operations and hody examinations at night with comfort and perfection. The engraver, the draughtsman, the watchmaker, in fine, all workers of delicate work can extend their operations at night with comfort and ecouomy; whilst by auy other system of lighting the amount of uncondensed light needed for eucb purposes would he too great to be economical; and if condensed by an additional artificial means, it would add extra expense and would never be so comfortable as in our system.

The best plan will be to furnish every house with a set of two to three different inter-changeable lenses for general purposes; and every individual may add the special lenses adapted to his work, his tastes or his needs.

3d.—Control of the Physical and Chemical Properties of Light.

We have only to intercept the heam or beams of light, before they reaeh the secondary lenses with shades of different colors, and of appropriated eubstsnces or media, and we will modify the properties of light at will, with ease and economy. This is invaluable for the treatment of ophthalmic diseases at home and in hospitals; it is of great service to photography, where lights of different colors and of differcnt actinic power are needed; it will aid many other industries in analogous ways; it will be a most powerful and fitting aid to theaters, where scenic effects of all kinds are needed.

Comparison with other Electrical Systems.

Let us compare now our system with the others. The first class of electric lighting has a very restricted, practical limitation hoth in its applications and its cost. It is very seldom that a very strong light can he utilized; being therefore necessary to produce electric lights of a not very large power, wbich increases more and more the expenses; and even then it cannot he used iu small spaces. On the other haud, all the systems of the second class of electric lighting, in which the electric current is divided, have two practical limitations. As the waste or loss of electricity increases with the numher of small lights, it is necessary to use a weak original current in order to decrease the numher of said lights; hence great expense of production. And if the production be made cheap by making the original current very powerful, then the number of subdivisions increasing, the loss and expense grow out of proportion. Iu both cases those methods are inapplicable.

Whereas our method, allowing the subdivision of light into any number of emaller lights and of any desired intensity, with a emall loss, that ie independent of the number of lighte, affords the opportunity to produce electric light in very large quantities, larger in fact than ever before attempted; it will therefore be much cheaper, and no other syetem can claim this advantage. Thie will make our method extremely cheap; and hesides it can be utilized or applied to all kinds of uses, from the highest requirements of modern industry to the most humhle of houeehold purposes.

The loss in our system is so small because it is independent of the number of the secondary lights produced: it is only due to the reflection of light, which can be reduced practically to only 8% for each reflection, using totally refracting prisms as reflectors. And ae in a city there will not be required more than six reflections or changes of direction, the total loss will never exceed in practice 50% of the original light, no matter in how many small lights the light is subdivided. But in the eecond class of electrical systems, the total loss far exceede 999% per thousand; and when the number of secondary lights increases, the total amount of light reaching destination is soon less than 1-100,000th of the original light. This single fact shows the immense superiority of our syetem upon any other yet proposed.

But this is not its only advantage.

When the current of electricity is divided, the secoudary currents must be independent of each other; otherwiee, when one of the lamps has to be extinguished, or its intensity varied, all the other currents and lights would also be altered; to obviate this, every secondary circuit has to be made of a constant resistance, which meane that whether a lamp is lighted or not, or whether its intensity is varied, the secondary circuit correeponding to it always spende a constant amount of electric current. This intro-

duces an element of great wastefulness. Moreover, the currents or circuits of each room in a house being independent of each other, they are wasted awsy, whether the room is in use or not. All of which is avoided in our system hy the shifting of light from place to place, as explained before. To put an instance, let us suppose a house having 15 places to be lighted, rooms and halls. Some rooms need sometimes 6 or 8 burners, some 4, some less: as an average such house will bave 30 or 35 burners, although not in constant use. By any of the other systems of electric lighting, that house needs a constant supply of electricity enough for said 30 or 35 burners; whilst in our system a constant supply of 12 or 15 burners will suffice for all purposes, because the light can always he shifted in any amount to the room where needed. This item alone gives to our system a saving of about 50% upon all the others.

Another consideration is that the systems with subdivided currents require every lamp to be connected to the general circuit by two conductors. The length of the circuit would soon attain hundreds of miles for a city; it has been estimated that the conductors needed to supply the city of Berlin with electric light by such systems would cost some $60,000,000. And all such expenses are avoided by our system.

Again, the number of electric lamps or regulators needed in such systems is excessive; which will greatly increase the expenses. The lamps, besides, require a great deal of attention and great expenditure of carbon points; and as they are delicate mechanisms, they are not fit to be used hy people in general, they are very liable to get out of order, producing expenses for repairs, and often depriving the consumers of their light; therefore they are expousive and uncomfortable. All of which is also avoided by our system.

Finally, we will observe that the electric light always produces a whistling noise, and that its intensely focal heat acts chemically in the air, giving out small quantities of nitrous acid and nitric acid, which are very poisonous. Both defects are unavoidable in any system of electric lighting except in ours. Ours also is the only system where the focus of light is kept away from the places where used, which affords the opportunity of saving to the consumers the trouble of attending to any machinery or electric regulator.

[Concluded Next Week.]

Tombstone District.

Surveyor-General John Wasson has just returned frnm a visit to Tombstone mining district, to the mill-sites on the San Pedro and to the southern and southeastern slopes of the Huachuca mountains. He says that the object of his visit was to notice the general characteristics of the sections of country named, as he had never before seen them. Although disposed to be a "bear" in mining matters, he says the Tombstone mines have never been as highly represented as their actual merits plainly justify, and that the owners of leading claims there have been absolutely modest in speaking of them. His time was limited to less than a whole day, and therefore only made a personal inspection of the Tough Nut, Contention and Lucky Cuss, and took a hasty glance at some others. The ore in sight in the mines named is immense, and of its richness the assayers all testify and the appearance of the ore indicates the accuracy of their testimony. Numerous assays are daily made from average samples taken from the faces of the shafts and tunnels as they are advanced by the miners. These assays are not made for selling or marketable purposes, hut to daily know the value of the ore and to ascertain any changes of the component parts that may occur. The results are not given to the public, hut it is clearly known that they average up in the hundreds and frequently reach thousands. There is a goodly proportion of gold in the ore generally. Night and day shifts of men are employed on the Lucky Cuss and Contention, and perhaps on the Tough Nut, but the latter claim has already been so well developed and has so much rich ore on the various dumps that a very small force of miners can supply a ten-stamp mill for years to come. The Tough Nut and Lucky Cuss have numerous cuts, tunnels and shafts, ranging from a few feet to 75 feet, and the Contention has two shafts 130 and 110 feet respectively, with a 250-foot tunnel and some crosscuts on the 110-foot level, and all the work is done in the exact order of permanent and economical development. These three mines are specially mentioned because they are the most developed, although many others have shafts and tunnels of various sizes up to 75 feet, and they exhibit the most satisfactory quantities and qualities of ore. Were this district in Nevada, California, Utah or Colorado, Mr. Wasson is convinced that 20,000 men and millions of capital would be invested before another year opens.—*Arizona Citizen.*

The Keely Motor.—So long a time has elapsed since anything was heard from Keely and his motor that most people had forgotten him, or concluded that he had given up in despair his attempts to "bridle" the new and powerful force which he claims to have discovered. The Philadelphia *Times*, however, says that during all these weeks and months Keely has been diligently at work building what he calls his "vibratory engine," which is to ntilize the new motor power, and is now engaged in "graduating" the engine, which peculiar process, he says, will enable him to intensify the action of the vapor.

Useful Information.

Hints on the Use of Plaster of Paris.

The plaster may he made to "set" very quickly by mixing it in warm water to which a little sulphate of potash has been added. Plaster-of-Paris casts, soaked in melted paraffine, may be readily cut or turned in a lathe. They may be rendered very hard and tough by soaking them in warm glue size until thoroughly saturated, and allowing them to dry.

Plaster of Paris mixed with equal parts of powdered pumice stone makes a fine mold for casting fusible metals; the same mixture is useful for encasing articles to be soldered or brazed.

Casts of plaster of Paris may be made to imitate fine bronzes hy giving them two or three coats of shellac varnish, and when dry applying a coat of mastic varnish, and dusting on fine bronze powder when the mastic varnish becomes sticky.

Rat-holes may be effectually stopped with broken glass and plaster of Paris.

The best method of mixing plaster of Paris is to sprinkle it into the water, using rather more water than is required for the batter; when the plaster settles pour off the surplus water and stir carefully. Air bubbles are avoided in this way.—*Boston Journal of Chemistry.*

Noiseless ware is a novelty in china-ware introduced by Mr. Vernon, of Scotland, and which is well spoken of hy the London *Pottery Gazette*. It consists in providing at the base of the article, or, in case of covers, under the rim, a groove, into which is riveted a strip of india-rubber. This strip is so formed that when run into the groove it fits tightly, and that part of it which projects beyond it effectually prevents the article from scratching any smooth substance on which it may be placed, insures the greatest quiet when the article is being moved about, and renders it less liable to that slipping from trays that now and then causes much grief at meal-time. At the Royal hotel, Glasgow, Mr. Vernon has placed on exhibition quite an elaborate selection of wares (dinner and tea services, toilet sets, etc.); and of particular interest is a display of shipping ware placed on a rolling table, the surface of which is partly plate-glass, partly finely-polished wood, and partly cloth. The table is set a-rocking, to imitate the conditions of a cabin table in a storm at sea, but the ware persistently refuses to budge. The value of this simple invention for ship crockery will be apparent.

Red Fire.—There are certain recipes which, though often published, are still continually called for; and among these is "red fire," so much used in fireworks, amateur theatricals, and the like. The following is commended as both safe and cheap: Take by weight one part of shellac and four of well-dried nitrate of strontia; mix thoroughly in an unpowdered condition; heat in a tin dish to the melting point of the shellac; after cooling, the semi-fused mass is to be pulverized. This is not expensive, is safe, without tendency to explode, and burns quietly, slowly, even when strewed on damp ground, and produces a very good effect. The mixture for red fire is usually composed of nitrate of strontia, chlorate of potash and sulphur; this frequently takes fire spontaneously, especially when flowers of sulphur and imperfectly dried nitrate of strontia are employed.—*Boston Journal of Chemistry.*

The Chinese subject the greater part of their porcelain to only one firing, first drying the pieces sufficiently in the air to prepare them for glazing. This plan they are able to pursue, because the nature of their material is such that it resists the entrance of water. Their glaze is much superior to any in use in the European potteries; but it requires the most intense degree of heat for its fusion, and considerable art is consequently required for the management of the fire, as well as in the construction of their ovens. These are built in the most substantial manner, so that when the fire is at its greatest hight the hand may be applied to the outside without any fear of burning.

The repeated applications in copper or brass, of alternate washes of dilute acetic acid and exposure to the fumes of ammonia, will give a very antique-looking green bronze; but a quick mode of producing a similar appearance is often desirable. To this end the articles may be immersed in a solution of one part of perchloride of iron in two parts of water. The tone assumed darkens with the length of immersion, or the articles may be boiled in a strong solution of nitrate of copper. Or, lastly, they may be immersed in a solution of two ounces nitrate of iron, and two ounces hyposulphate of soda in one pint of water. Washing, drying and burnishing complete the process.

A softer solder than is used for ordinary brass work is composed of equal parts of zinc and copper. A very hard but fusible solder is composed of two parts zinc and one part copper. This solder is so hard and brittle that it can be easily crumbled in a mortar when cold.

A glass manufactory in Hanover, Germany, makes glass which is a close imitation of marble, and tables and floor tiles which are pronounced preferable to marble on account of their extreme hardness.

Brine for the Preservation of Animal and Vegetable Matter.—M. Mercier, in the *Archives de Geneve*, recommends a solution of common salt for the preservation of zoological and botanical specimens for scientific purposes. It is cheaper than alcohol, does not evaporate, does not extract or alter the colors, and is not likely to be surreptitiously drunk. The brine is boiled to expel gas, and the specimens are immersed at about 80° C., and closed up. If the brine really answers the purpose, it will save a good deal of expense and trouble in museums.

Pocket Mucilage.—Boil one pound best white glue, and strain very clear; boil also four ounces isinglass, and mix the two together; place them in a warm hath (glue kettle) with one-half pound white sugar, and evaporate till the liquid is quite thick, when it is to be poured into molds, dried, and cut into pieces of convevient size. This immediately dissolves in water, and fastens paper very firmly.

A new European lubricant consists of an intimate mixture of tallow, black lead and melted india-rubber waste.

Good Health.

Ringworm.

Dr. John V. Shoemaker, in a paper read before the American Medical Association on "Ringworm in Public Institutions," states that, while treating a large number of cases of ringworm, which occurred in one of the public institutions for children in Philadelphia, he scraped some of the scales from the scalp of one of the children, and also from the chest of another, and applied them to the bodies of two cats. For three days no change was perceptible on the parts upon which the scales were placed; on the fourth a small meal-like patch was detected upon one, and on the other the hairs began to fall out. The fifth day the patches assumed the characteristic circular form, and the affection continued to spread rapidly until spots the size of a large coin were almost denuded of hair. Scales from the patches of one of the cats were reinoculated on a healthy portion of the scalp of one of the children and thigh of another, with the effect of producing the circumscribed spots of ringworm. Two specimens were now prepared, one from the inoculated child, the other from one of the cats, and revealed under the microscope fungi of a luxuriant growth, threads being present in large quantities.

Ringworm owes its origin to a vegetable parasite, the *Trichophyton tonsurans*. It generally commences among those that are improperly cared for, and, as it is exceedingly contagious, it spreads rapidly to those coming in contact with the infected. The fungus has a predeliction for the strumous and debilitated, and flourishes upon them luxuriantly.

Among the 50 cases afflicted on the occasion referred to the author found that a large percentage were the children of subjects of chronic disease, worthless and confirmed drunkards, and inmates of charitable institutions or almshouses. The affection frequently has its origin in the lower animals, and is transmitted from them to children and adults. A number of cases are on record in which it has been communicated directly from cows, calves, oxen, horses, and cats to individuals, and then to other members of the same family. A well-marked example of its direct transmission from a cow to an individual came under the author's notice and treatment a short time since. The experiments on cats, noted above, are also additional strong proof that the fungus can be transmitted from lower animals to children, and from individuals to animals, and also verify the fact that the scales of the scalp are capable of producing by inoculation ringworm on other parts of the body.

Dr. Shoemaker states that his observation has been that, when the affection attacks the body and is not complicated, it is easily cured; hut when it involves the head it is a most tedious and unmanageable disease, owing to the mischievous influence of the hair. He believes, however, that the failure to promptly eradicate the disease in the majority of cases in public institutions is due to negligence, want of patience, and the inability on the part of nurses and attendants to properly understand the orders of the physician.

Errors.—It is a popular sanitary error to think that the more a man eats the fatter and stronger he will become. To believe that the more hours children study, the faster they learn. To conclude that, if exercise is good, the more violent the more good is done. To imagine that every hour taken from sleep is an hour gained. To act on the presumption that the smallest room in the house is large enough to sleep in. To imagine that whatever remedy causes one to feel immediately better is good for the system, without regard to the ulterior effects. To eat without an appetite; or to continue after it has been satisfied, merely to gratify the taste.

It is said that the oil that exudes from orange peel when bent between the fingers, will check the progress of carbuncles in their incipient stage. Perhaps the oil may also be useful for other cutaneous eruptions.

Fish as Brain Food.

Since during the acts of sensation and intellection phosphorus is consumed in the brain and nervous system, there arises a necessity to restore the portions so consumed, or, as the popular expression is, to use brain food. Now, as every one knows, it is the property of phosphorus to shine in the dark, and as fish, in a certain stage of putrefactive decay, often emit light or become phosphorescent, it has been thought that this is due to the abundance of phosphorous their flesh contains, and hence they are eminently suitable for the nourishment of the nervous system, and are invaluable brain food. Under that idea many persons resort to a diet of fish, and persuade themselves that they derive advantage from it in an increased vividness of thought—a signal improvement in the reasoning powers. But the flesh of fish contains no excess of phosphorus, nor does its shining depend on that element. Decaying willow wood shines even more brilliantly than decaying fish. It may sometimes be discerned afar off at night. The shining in the two cases is due to the same cause—the oxidation of carbon, not of phosphorus, in organic substances containing perhaps not a perceptible trait of the latter element. Yet, surely no one found himself rising to a poetic fervor by tasting decaying willow wood, though it ought on these principles to be a better brain food than a much larger quantity of fish.—*Dr. J. W. Draper.*

How to Prevent Diseases among Children.

A correspondent of the New York *Times* says that he has followed a recommendation from a lady to evaporize a little carbolic acid daily in the heaters as a disinfectant and a preventive against contagious diseases, and the results have been most satisfactory: "I have a large school, and out of the whole number only two pupils have been sick with scarlet fever, and even these cases were indirect ones. In my own family, which consists of 14 children—fortunately not all my own—and five adults, not one has been afflicted with any malady, not even with a sore throat, for longer than a day or two. We certainly keep the house minutely clean, ventilate it thoroughly every day, and never heat the rooms above 66° Fah. During my 30 years' experience I have never seen the like."

We think it probable that the use of a small quantity of carbolic acid in the manner above mentioned may, in some cases, be beneficial. But if it were the golden rule in every family to keep the house minutely clean, ventilate it thoroughly every day, and never heat above 66° Fah., there would probably be little need of carbolic acid or any other drug.

Castile Soap.—The reason that castile soap is so extensively advised by physicians is because of its purity and freedom from alkali. In the manufacture of castile soap, vegetable oil is used instead of animal fat, and great care is taken to avoid an excess of the soda; only enough being used to take up or neutralize the oil. This soap, therefore, is mild and gentle, and can be used on irritated surfaces or wounds, where common soap would give pain, perhaps occasion injury. The mottled sorts of castile soap are made by the addition of a small quantity of sulphate of iron—copperas. This copperas in solution is stirred into the soap while in a fluid state. At first the color is bluish, on exposure to the air it changes to a red. This soap was called "castile," for the reason that it was largely made in the province in Spain so called. The largest amount, however, comes from the south of France, and in Europe this variety of soap is more generally known by the name of Marseilles than castile.

Difficulty of Breathing.—In cases of difficulty of breathing, the bystanders commonly raise the sufferer to a sitting position and allow the head to bend forward, and hy so doing, they increase the difficulty. Dr. B. Howard, in a communication to the Royal Medical and Chirurgical Society, points out that there is "an anatomical remedy against respiratory obstruction." This remedy is very simple, and may be described in one word—position. Raise the chest, and let the head hang back as far as may be. The effect of this position on the respiratory apparatus is described in anatomical detail by Dr. Howard; hut under all the words rests the simple fact, "that complete extension backward of the head and neck should be the first and instant measure in threatened or actual apnœa, both as a remedy and as the first step toward success in artificial respiration."

Warts.—The beginning of the growth of warts is due to obstruction which prevents the free action of the excretory organs. This obstruction produces a thickening of the tissue. The process is somewhat like that observable on trees. Owing to some injury, the bark becomes diseased or damaged, and the juice, or sap, hy its unnatural exposure to the atmosphere, undergoes a chemical change, and a growth is produced which becomes in time a mass of hardened tissue—a kind of fibrous or cellular tumor in the tree. One frequently sees these growths; their forms are much varied, and by no means conducive to the beauty of the tree. Careful treatment with chromic acid will remove warts.

Coleman's Patent Sluice, J. Hendy, S. F.

The Week.

The stock market, which has heen in a peculiarly depressed condition since the adoption of the new Constitution, has rallied somewhat in the last few days, and now appears firmer and more cheerful. There are few mining districts from which reports are not encouraging. Plumas is putting down shafts and extending tunnels; Shasta resonnds with a chorus of picks, sledges and the roar of hlasts; Nevada, Placer, and the other gravel districts, rejoicing in the agreement with the farmers that they shall he allowed to finish the year without restraint from the mining debris decision, seem revisited hy new energy and rich finds. In Oregon, the prospect is less hright, for in the southern part at least, the want of water is heginning to be seriously felt. Colorado continues to make the prospector happy, hut from many sides come grave whispers as to the depth aud permanency of her principal mines, and openly expressed fears that Leadville will prove hut another White Pine. Arizona, as usual, shows good progress, and Tombstone and Arivica must look to their laurels or they will he surpassed hy the California and Don Cahesas, while Santa Catarina and Comstock are not far hehind. Nevada is steadily moving on with the developments on the Comstock and the indications are good that the present stringers found will ere long devolop into permanent ore hodies. Paradise and Silver State districts are gladdening the prospector's heart, and, in fact, from every side, the happy and hopeful miner comes, confident and rejoicing in the greatness and certainty of the prospective fortune he has "monumented."

The work of surveying and locating the Northern Pacific railroad is to begin immediately at Astoria, Or.

About 1,200 cattle perished in Okanagan county, Or., last winter, hut there are over 10,000 left.

A Field for the Unemployed.

There is in this city at the p'sent time a large nnmhsr of men out of employment. The most of these are men who have heen accustomed to manual labor, though many of them have not, heing clerks, hook-keepers, etc., with a considershle sprinkling of young men who have just arrived at that age when they need and should have some sort of employment to enahle them to earn an honest livelihood. Then, hesides these men and lads, we have here a great many women and girls who are in want of and should have something nseful to do. The city does not and never can afford employment for all these people. Just now there is hut little huilding or other kinds of improvement going on. Business at our machine shops, mills and foundries, is slack, all our manufacturing and mechanical industries heing greatly depressed. Nor is it prohahle that we shall very soon experience a more active and prosperous condition of things. The city has rather outgrown its requirements and will have to stop and wait a little till its business and population overtake it.

But were San Francisco growing and her industries prosperous there would still he here a great surplus of working population, two-thirds of which should seek employment elsewhere. But where should they seek it? Why, in the country, of course—out on the grass and grain growing lands, in the mines, the fisheries, the forests—aloug all the grand avenues that there open to energetic, persistent, well directed enterprise. These nnemployed people ought to know this, for they have heen told of it a great many times. Indeed no pains or expense have heen spared to hring this knowledge home to them through the newspapers and other popular channels of intelligence. Books have heen puhlished, lectures delivered and pamphlets printed hy the million for the purpose of acquainting them with the opportunities, the grandeur and the resources of California. The Statc has heen so well advertised hoth at home and abroad that all, even the most ignorant, may he supposed to know much ahout her soil, climate, mineral and other forms of uatural wealth, and to duly appreciate the advantages she presents as an industrial field and place for settlement.

But how to avail themselves of these advantages is the question with these idle, inexperienced, short-handed and sometimes wholly impecunious persons. It is to little purpose we tell them ahout all this unappropriated wealth and these various openings for lahor if we cannot hy some useful suggestions help them to turn the same to practical account. And to do this is the hard part of the husiness. To expatiate on our resources and give advice of a general kind is all easy enough; hut to point out exactly what should he done and how to do it is another and more difficult matter—so difficult that it is with no little misgiving we venture a few hints on a suhject so environed with perplexity and douht.

In the first place it seems to us that those hranches of work that our women and girls can do as well, or nearly as well, as the men should he wholly given over to them, the men confining themselves to snch kinds of lahor as the opposite sex cannot so well perform. Under this arrangement a large, and what has heretofore heen the most helpless class of operatives, wonld he provided for. In a world where it is necessary and proper that all should work, one set of toilers should not he permitted to encroach upon the fit and natural labor sphere of another. This would he neither economical nor just. Even after so enlarging the province of woman it would, as compared with that of man, remain greatly restricted. In most countries it would, to he sure, work a present hardship, such ejection of the men from the various handicrafts and callings to which they had heen trained. But here, where we have so many rugged industries and such great extents of agricultural and mining lands open to all, such surrender could he considered hardly more than a temporary inconvenience. All the unemployed and illy-employed men in San Francisco might find opportunities for earning fair wages in the mines of this State, if only they could he placed there nnder the right conditions and would afterwards work with ordinary diligence. So also could these men do the same thing at farming, fruit growing or stock raising, once they had a start. But it requires a good deal more time and money to get started at either of these vocations than it does at mining, wherefore we shall in what we have to say in this connection confine ourselves to the latter subject.

It is now a long time, 20 years or more, since the whites hegan to leave the mines of California hecause they could no longer make the hig wages to which they had at first heen accustomed, the general impression heing that the pay diggings were ahout exhausted. And so, ahandoning the mines they scattered, some going elsewhere to prospect, and some engaging in other pursuits. Meantime, another people came in to occupy their places. During all these years a tide of Chinese has ehhed and flowed through the mines of California, there never having heen less than from 15,000 to 20,000 of this race at work in our placers. What their earnings may have heen no one knows: that they were satisfactory is evidenced hy their persistent labors and steadily increasing numhers. That the most of them have done well may he inferred from the fsct that great nnmhers of them have on leaving ths mines gone directly home to China. Their average sarnings have, no douht, heen much larger thsn has generally heen supposed.

And now the question arises how is it that the Chinese have heen ahle to live and thrive working mines so generally ahandoned hy the whites as heing too poor to sfford them living wages. In considering this question we do not, of course, overlook the fact that the Chinamsn can suhsist himself somewhat more cheaply than the white man, having at the ssms time no family to support nor puhlic duties to perform. But on the other haud he lahors under csrtain disadvantagss that more than offset these favoring conditions, leaving us to sesk elsewhere for the causes of his greater success, and which we are inclined to think will he found in his more systematic, intelligent and provident way of going ahout the business. The Chinaman who has determiued to engage in mining does not rush off to the diggings alone, illy outfitted and unadvised as to where he is going, or what he will he ahle to do aftsr reaching his destination. These people when they move go in squads, thoroughly organized, and acting in concert. In this manner they manage to economize time, freight, passage money and other expenses, while they act with more efficiency. In many instances these foreigners know hefore they leave home just where they are going on their arrival in California, having been posted as to the most eligihle mining localities hy there returning countrymen. There are here in San Francisco, various associations who take it upon themselves to collect information from all parts of the mines, and to secure properties therein, for which purpose they send agents to examine different districts, and to take up ground where they can find any unoccupied, and buy or lease such as has heen already located if suited to their purpose. In these cases they aim to get hold of extensive tracts, so that they can he worked hy large gangs of men. They prefer shallow placers, tailing deposits and river heds, which can he opened and worked at little expense, most of the outlay consisting of labor. In selecting these localities they evince much shrewdness and tact, as they afterwards display the greatest diligence and economy in working them. Their provisions, consisting largely of rice and other commodities imported from China, all cheap and simple, are purchased from their own countrymen, as are also most of their other supplies. Everything is hought at wholesale, and consequently at the lowest rates. Whether in the matter of living or outfitting their claims, they incur no expense that can he avoided. Hand is suhstituted for steam power, and rude water-driven wheels are made to perform the duties of costly ditches. Instead of log or hoard cahins, tents, and more often hough houses, serve for protection. Their cooking is done in a few large kettles set on stones, neither stoves nor fire-places heing required for this purpose. They sleep on mats in their ordinary clothes, and therefore need few hlankets. They work long hours and industriously, and so manage in the end to make money, sometimes even in very poor diggings.

In the foregoing we have the secret of the Chinaman's success as a miuer, and while it is not expected that the white man will have recourse to all these Mongolian methods or consent to live so nearly after the style of savages, it might be well for us to consider whether the superior race could not in the conduct of their mining affairs adopt something of John's system, economy and close calculation to advantage. To the extent of sending out experienced and capahle men to examine, choose and secure eligihle localities for mining operations and the ohservance of extreme caution in the matter of expenditure, we certainly might profit hy his example. If the unemployed men in this city and other places where lahor exists in excess of demaud, would adopt the plan of forming small companies and hy sending out a suitahle man or through other means ascertain where a good opening presented itself for engaging in mining, and then set ahout the business carefully and follow it up with persistence and industry, they would soon find their condition and prospects greatly improved. There are thousands of such places in this State, to say nothing of those that exist elsewhere. For many reasons, however, California is the hest country for men of small means to commence mining in. The ease with which the mines can he reached, the climate and the mineral-bearing deposits, heing, for the most part, placer and anriferons, recommend it to this class above any other part of the Pacific coast. Let our working people who are doing little or nothing consider these suggestions, and see if they cannot manage to get out into the mines and find or make openings where they can earn small wages at first, with a fair prospect of securing after a while employment and interests that will bring them a better reward. If properly undertaken we are sure this could he done, and hope to see some general movement entered upon looking to that end.

The Acme Mine.—We were shown this week a very rich specimen of ore from the Acme mine, Bodie, taken from a depth of 56 feet below the surface. They are now down 80 feet on the ledge and when they reach 100 feet they expect to commence crushing ore. Ore of the class shown in the specimen, which contained fine particles of native silver, will assay as high as $7,000 per ton, most of the value heing in gold.

The French cahinet talk of resuming relations with Mexico.

The Tributers and Coasters.

As the hnsiness of mining has progressed on this coast there has arissn a necessity for many new words and tsrms to give expression to the various forms the husiness has taken on and the novel practices that have grown up. To mest this want words wholly new have heen invented or others already in use have heen avsiled of, their original meaning having sometimes heen extended or slightly perverted to enahle them to hetter accomplish the end for which thsy were introducsd. Thongh to the stranger many of these terms may sound outre snd hsrharons, the California ear has become reconciled to their use and we all rscognize their good standing in the vernscular tongue. The *prospector* the *stampeder*, the *coaster* and ths *tributer* are all understood to he men and not *wild animals*. They helong to the various corps of the mining army, and if we did not designate them hy these we would hardly know hy what other names to call them. While the meaning of the first two of thess terms is too well understood to require the services of an interpreter, the other two, heing less familiar, may he the hetter for a little explanation.

The coaster is a person who frequents abandoned or neglected mines, and rummaging ahout gouges out any hits of good ore that may have been left in the deserted drifte and stopings, though not always over scrupulous as to how or where he prosecutes his calling. He is to he regarded not so much a freehooter as a gleaner, who goes over the stuhhle field gathering up what has heen left and would otherwise he lost. The coaster does not confine his operations to underground workings, hut visits old ore dumps and overhauling them picks ont and appropriates any fragments of good looking ore that his eye may happen to light upon, and he has a quick eye to their detection. This fraternity is made up lsrgely of Mexicans, and others of like easy going hahits; men who dislike steady hard work, hut bestir themselves where there is a chance of good pay, liking the husiness none the less if it happen to he slightly tinged with the surreptitious. Many a goodly nugget and arroha of rich ore in days agone have these fellows secured from the waste dumps along the Comstock. A few of them reaped a harvest too from the vacated shafts of Esmeralda, when that district was so hastily and prematurely relegated to a condition of desolation and vacancy. More or less of this gouging, cleauing-up sort of work has heen practiced in all the old and nearly deserted mining camps in the country; the overhauling of the waste ore dumps being common wherever their owners will permit it. Why men engaged in this style of ore gathering should have heen called coasters is not quite clear. A coaster in nautical phrase is a vessel employed running from port to port, keeping near shore, being in this distinguished from crafts that voyage across the ocean. In that the coaster carries on a more restricted and irregular trade than the deep sea-going craft—the term as applied to this school of miners has some fitness and significance, though it is manifestly lackiug in the appropriateness that marks most words helonging to the class under consideration.

The word trihute is not new as applied to a certain class of miners, the extraction of ore hy the tribute system having long hsen in vogue in older countries. The plan heing, however, of recent introduction here, calls for some explanation, the meaning of the term as used in this connection, having heen moreover entirely perverted from its usual acceptation.

A trihuter is a miner who, working a section of the lode assigned to him, receives instead of wages a certain percentage of the ore extracted or of the metal made from it. In the *Stock Report* of recent date we find such a good description of this system and its mode of operation in onr home mines that we give here the main facts set forth in that paper.

A good deal of the ore reduced in the Manhattan mill at Austin, Nevada, is extracted from the company's mines on trihute. In proceeding with this husiness, the company, from surveys made and for other reasons, having good cause to suppose that an ore hody exists at a certain poiut in one or more of their lodes, enters into a contract with a party of miners who agree to go on and perform the work necessary to open up the ground and extract the ore for ten per cent. of the net prodncts of hullion, the company furnishing tools, timhers and supplies, and doing the hoisting and removing the waste. They also haul the ore to mill and reduce it. As only the net products are divided with the miners, it is to the interest of the company that this should he reduced to a minimum, an end thatis reached through the establishment of pretty steep charges for milling and a liberal margin allowed for discount on hullion and loss in actual working. The miner gets his ten per cent. of the net product, hut the latter is hy the above process reduced as low as possihle. To illustrate the workings of this system a little more in detail, let us suppose the miners take out ten tons of ore which are sent to the mill and crushed. The company assay the pulp, agreeing to return 80% of the assay value; they next deduct 18% or something like that, for hullion discount; then $35 per t n is charged for milling, and, finally, a modicum added for taxes, after which they are ready to divide what is left on the hasis agreed upon, with the miner, who, despite this depleting method, generally realizes hetter pay nnder this system then when he works for wages.

American Gauging and Measuring Implements.—No. 2.

We continue on this page the showing, which was begun in our last issue, of the progress made in this country in the manufacture of measuring machines and standard gauges. Again we shall quote from the paper read before the Franklin Institute by J. Richards, of the firm of Richards, Haod & Taylor, proprietors of the American Standard Gauge and Tool Works, Philadelphia:

Fig. 1 is what is called a calipering machine, nsed for traosmitting sizes, but not for measuring beyond a degree of accuracy which the pitch of a carefully made screw may give. Such machines are employed io making gauges, reamers, drills, mandrils, taps and so on. Being inflexible, or nearly so, the accuracy is greater than in using common calipers, but the main difference and that which gives most value to snch machines, is that they indicate as the size is approached and also variations above or below standard size by 1-10,000 of an inch. A workman using such a machine has no dread of spoiling his work. He can make a loose fit, a shrinking fit, or a forced fit, as may be required. The value of such a machine in a fitting shop was never conjectnred until one was made and put into nse at the gange works. At first it was intended for nse only in grinding mandrils or gauges, bnt soon became an implement of general nse. A workman would finish a piece of turned work to 5-1,000 or 10-1,000 of an inch in diameter without losing auy time. Seeing the valne of snch a machine, especially for the tool rooms of large machine shops, and also requiring more of them in the gauge works, a smaller and cheaper machine, measuring to four inches, was prepared.

This machine as shown io Fig. 2 is arranged with divisions at one eod for the 1-5,000 of an inch, and at the other end for the 1-3,200 of an inch. The same machine can be adjusted for measuring, if deeired, the index points being shaped to correct irregularities of the screws. The makers incline to the opinion that machines of this kind will come into general use, and are experimenting on various modifications to perfect and cheapen them. With this much in respect to the machines employed in gauge-making, it will be next in place to describe some of the implements produced.

It wae noticed in various shops that, whether provided with cyliodrical gaugee or not, fixed calipers were the implemeots in use, in other words, were the working tools, and it was resolved to make these a base, as it were, for ganging, reversing the old eystem, which would procure the most expensive ganges for reference, aod then go downward to calipers and other tools; nevertheless a set of calipers with some means to keep them in adjustmeot forms a tolerably complete equipment to maintain sizes in a machine shop. There are, in such a case, hot few, if any, tools not in practical use, while the original cost is only a fourth to a third as much as under the old system.

After various experiments with molded steel, it was found to be suitable for calipers. When prepared for the purpose, it would harden the same as cast eteel and, when carefully treated, was free from inherent strains. Several differeot forms were tried, the result being finally to adopt the one shown in Fig. 3.

To keep these calipers in adjustment there are fnrnished what are called corrective gauges, in the usnal form in Fig. 4. These gauges are like what are called etep ganges in appearance, hut are made on a wholly different plan. The disce or plates composing the sizes are iodependent and ground separately to size, the same as cylindrical ganges; they are mounted on a epindle or holt, which holds them together, but permits their being turned around. These discs ars made of iron or steel, and can be hardened if required; for ordinary cases, however, hardening is of no importance, and adde considerahly to the expense of preparing them. The limite of accuracy to which these gauges are made are 1-5,000, 1-10,000, and 1-25,000 of an inch, the expense rising with the degree of accuracy, but not in the same proportion.

The sizes are usually from ¼ to 2½ inches by sixteenths, and from 2½ to 4 inches by eights of an inch, making 49 eizes, which can be mounted in an iron case, as ehown, and be kept in the hands of a manager or foreman, who can at pleasure inspect and test the calipers in use.

If aoy wear or derangement exists, a caliper can bs corrected by a careful blow on the outer or inner edge, as the case may be, requiring but a moment'e time, and but little skill after a few experiments.

Fig. 5 shows a kind of fixed calipers, made of eteel or white iron; the latter is recommended for rough use, being extremely hard throughout, and not liable to derangement by wear or accident. Pins and collars, which seem to be the most expensive and difficult kind of gauges to make, are by no meane so if, as before mentioned, time ie not taken into account. The pins are first made and the collars lapped out to fit; but by this remark it must not be inferred that the pins are ground to size by common emery wheels and io an ordinary grinding machine. Speaking for ordinary practice, this is not the case, because neither the naturs of grinding wheels or the movements for traversing, have been found perfect enough to finish pins to eize, and thers is good anthority for saying that nnns havs been finished in this manner in England.

The fixed calipers, whicb seem to be the most simple to make, are nevertheless ths most difficult, and require more implements and processes than anything clss. They are more snbject to change from temperatnre, and a portion of the grinding for adjustment has to be done on the faces of wheels, an operation which is in all cases extremely difficult, even if accurate results ars not required. The great variation of temperatnrs betweeo winter and summer is a considerable difficulty in gauge-making in this coutry. The lower temperaturo of winter can of course be controlled by artificial warming,

FIG. 1.

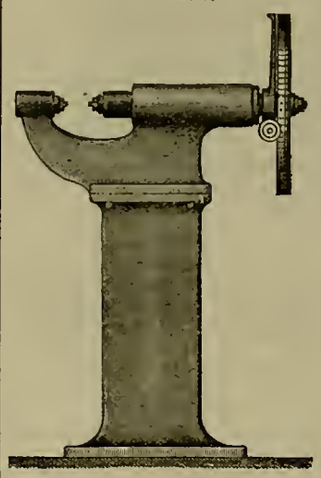

FIG. 2.

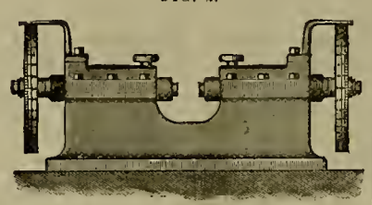

TWO FORMS OF CALIPERING MACHINES.

but the heat of snmmer is not so easily provided agaiost; so that io assuming a scale of temperature, 70° has been adopted at the Standards Department in Washington, and the measuring machiue, Fig. 3, has been adjusted at that temperature. In Eogland 62° is the common standard, while in Northern Europe a lower scale is common.

The Mountain Telegraph During Storms

Speaking of the difficultiee attending the keeping of the mountain division of the overland telegraph in working order, the Truckee *Republican* of a recent date says: The railroad telegraph wires cross the eummit in addition to those of the Western Union. During heavy storms, when trees are falling, landslides bearing away telegraph poles, aod avalanches sweepiog sections of snow-sheds into

FIG. 5.

FIG. 4.

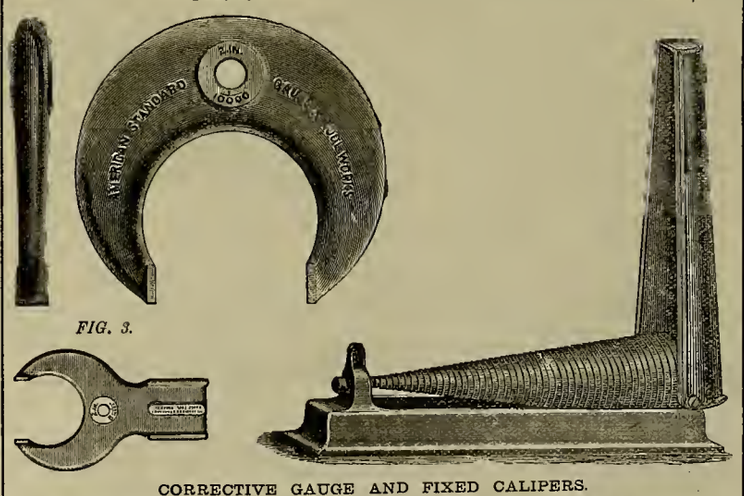

FIG. 3.

CORRECTIVE GAUGE AND FIXED CALIPERS.

the depths of the canyon, it becomes a matter of great difficulty to manage the telegraphic department. Between Summit and Alta, line No. 5 may be broken, and between Summit and Truckee, lines 5 and 6 may both be down. By a simple arrangement of telegraphic switches, No. 5 is connected with No. 6 between Alta and Summit, and with No. 7 between Summit and Truckee. By this ingenious syetem it is possible for a eingle dispatch to travel on each of the ten wires during some portion of its transit from Sacramento to Reno. In very violent etorms it not unfrequently requires the entire number of wires to make the equivalent of a single wire on the Sacramento division. A thoroughly disciplined corps of experienced telegraph repairere are constantly on the alert at the various stations on the Sierras, to detect and repair broken wires. Yet so fierce and furioue are the winter hurricanes and snow storms, that but for the system of switching wires, telegraphic communicatioo would frequently be impossible.

During April, 23,672 oubic feet of the etone embankment of the second section of the ssa wall were filled in.

Arizona.—No. 4.

[Written for the Press by W. H. S.]

Prescott, Phœnix and Maricopa.

Prescott is located up among the pioes, at an elevation of about 6,000 feet—has a good climate, good water, men of enterprise and brains, livo newspapers, churches, a first-class school, library, dramatic club, theater and good society. Fort Whipple, the beadquarters of Gen. O. B. Wilcox, Commaoder of the Department of Arizona, is only a mile from the town, aod the officers there, by their weekly receptions, serve to onliven aod brighteu society.

It was a wise thing, no doubt, so far as human foresight could forecast the future, to locato the capital of the Territory here, but railroads make great innovations, being often instrumental in destroying as well as building up towns. Yuma, from a place of impertance aod large business, has become a mere way station, so Prescott, notwithstanding its desirable locatioo, the eoergy and thrift of her people, will undoubtedly ccase to be the capital, and but the heat of snmmer is not so easily provided agaiost; so that io assuming a scale of temperature, 70° has been adopted at the Standards Department in Washington, and the measuring machiue, Fig. 3, has been adjusted at that temperature. In Eogland 62° is the common standard, while in Northern Europe a lower scale is common.

the trade of the Bradshaws will naturally go south to the railroad.

North, there is a large extent of mioeral country which will be developed in the near fnture, and within a radius of 20 miles there are several upland grase and agricultural valleys, notably those of the Agua Fria, Skull, Kirkland, and Pceples, all of which will, in ordinary seasons, produce crone of grain, vegetables and hay. These will contribute to make Prescott in the future what it has been in the past, a place of considerable importance.

One of the most important local industries is the manufacture of lumber. This suffers somewhat from the loss of that portion of the trade which now goes to the Valley of the Salt, and Gila, as this section will hereafter be supplied from the railroad.

About 10 miles south of Prescott there is a wide sweep of valley land which, in its desolateness, forcibly reminds one of the sea. It is well named "Lonesome Valley," for not a liviug creature was to be seen upon its many thouss nd acres. It is covered with thin grass, and would make good agricultural land were it not for the total abeence of water. A flowing well here would be more valuable than an ordinary gold mine.

Eighteen miles south of Prescott, in the valley of the Agua Fria, is the fioe grass and stock ranch of Nathan B. Bowers, Esq. This locality is peculiarly interesting, as upon this ranch, and in the immediate neighborhood, are found many ruins and other evidences of the ancient peoplo who once occupied these valleys. The massive walls of Mr. Bowers house are built of stones taken from one of these ruins, portions of which still remain near by. A short distance away there is what appears to be an ancient burial place. The graves, if such they be, are covered with flat stones laid in a circle, raised but little above the ground and about four feet across. Over 500 of these mounds have beeo counted in a space of about an acre. Who were these ancient people and when did they occupy this land? Mr. Bowers says that in excavating he has nncovered their floors, which were made of earth ponnded hard and smooth, and that wherever he has come upou any of their household utensils, consisting of the metate in which they ground their corn and pottery of various sizes and styles, he has invariably found them broken in pieces, leading him to the conclusion that the inhabitants had been forcibly driven from their homes by an eoemy, and their rude furniture destroyed.

One hundred and ten miles south of Prescott, on the Salt river, is situated the flourishing town of Phœnix. A new impetus has recently been giveu to businces here by the completion of the S. P. R. R. to Maricopa. The town is located in the midst of a wide plain or valley made fertile by irrigatioo, the water for that purpose being taken from the river, and it is said that there are a hundred thousaod acres in graio this year, mostly wheat aud barley. Dr. Jones, a gentlemao of wealth and enterprise, is experimenting with sugar caoe, having put in a large number of acres and with proper handling will bo sure to get a good crop. Here is a field in which some of the colored labor from the cane fields of Louisiana, now eeeking new homes, could find profitable and congenial employment. Phœoix is ambitious to become the future capital of the Territory. It is centrally located, and its importance will be largely increased by the building of a branch railroad, now io contemplation, from the S. P. R. R. at Maricopa, a distance of about 30 miles, over a country faverable for such construction. The town is flat, the drainage is on the surface, it is extremely hot in summer, and, unless its sanitary condition is well looked after, it will become, with a population of 4,000 or 5,000 people, very unhealthy. New buildings are going up, mostly of adobe; a baok has been opened; the price of lots is advancing; and there is an air of expectancy about the place indicating an appreciation of the new order of things about to be inaugurated by the iocoming of new people and the development of new enterprises.

Ten miles up the Salt, where the stage road from Phœnix to Maricopa crosses the river, is situated the fine ranch and flourishing mill of the Hon. Chas. T. Hayden. The mill is run by water power, having 24 feet fall. He also has a store here, postoffice, stage station, corrals, freight teams and a small army of Mexican and Indian retainers; broad fields of waving grain and herds of cattle, making him a veritable patriarch.

The new railroad town of Maricopa, the central and general distributing depot for middle and northern Arizona, is rather pleasantly located on a gentle rise in the desert near the Santa Cruz river, which is here a subterranean stream. It is flanked on either side by short ranges of mountains, aod between these, in a gap several miles wide, the railroad comes in from the west. Toward the east the wide illimitable desert spreads out as far as the eye can reach, broken here and there by isolated mountain peaks of bare and reddish rock, which lift up their jagged and serrated ridges out of the plain in many odd and curious shapes that glow with fervent heat in the noonday sun, and put on the most wooderful shades of color in the early dawn and evening twilight.

Here, where but a few weeks ago, the silence of the desert was unbroken by any sign of life or habitation, there is now an active, bustling town of more than 500 people, with postoffice, express office, stage office, stores, hotels, saloons, and new buildings going up on every side. The dust of the plain whirls itself in eddies above the ponderous freight teams as they come and go, bearing the products of many lands to distant mining camps and mountain towns. Maricopa is about 30 miles south of Phœnix, 140 south of Prescott, 170 east of Yuma, 50 west of Florence, about 100 northwest of Tuscon and 890 from San Francisco. It will be the distributing point for Florence, the valley of the Gila and the Globe mining district, east, Phœnix, the valley of the Salt, the miuing camps in the Bradshaw range, and to some extent, Prescott, in the north. It will have more permaneocy than most railroad towns, and contiuue a place of business importaoce until a branch railroad is built to Phœoix, when most of its business will be transferred there, aod that place will then become the distributing point for a still wider range of country.

Leadville Stock Exchange.—Sixteen enterprising business men of Leadville, Col., have recently organized a stock hoard, for the furtherance of real estate and miniog interests in that locality. It is to be called the Leadville Stock and Mining Exchange Association, and is making strenuous efforts to put itself in readiness for business by the 15th instant. Rooms have been furnished at the Clarendon hotel, a constitution adoptcd, permanent officers elected, and arrangements made with the Western Union Telegraph Company for obtaining the daily stock reports from New York and San Francisco. The officers for the ensuing year are as follows: Mr. H. A. W. Tabor, President; Mr. H. L. Swords, Secretary, and Messrs. H. A. W. Tabor, L. J. Smith, A. P. W. Skioner, John Kerr, Geo. A. Hinds, Joho Stewart and John W. Zollars, Directors. The exchange has now 47 members, all of whom are stated to be representative mining men of Leadville.

The Indians on Flathead reservation, Montana, are richer than the neighboring whites, cultivating their own farms and raising their own cattle.

CAUTION

To Hydraulic Miners.

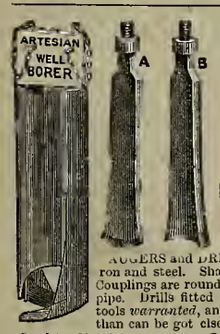
The public generally and Hydraulic Miners especially are hereby notified that any parties making or using the contrivance known as the HOSKIN DEFLECTOR will be prosecuted to the full extent of the law, said machine having been declared by the U. S. Circuit Court an infringement upon my patent, the

Bloomfield Deflecting Nozzle.

The public are also cautioned against using the Hoskin Deflector because of its danger to life and limb, this device having already occasioned several deaths and other serious accidents. The BLOOMFIELD DEFLECTOR is entirely safe, its two and a half years use without accident, as well as its construction, proves it to be a reliable contrivance.
Any parties wishing to purchase the right to use these Deflectors can do so by applying to the undersigned,

HENRY C. PERKINS,

North Bloomfield, Nevada Co., Cal., October 1st, 1878.



ARTESIAN AND SURFACE Well-Boring TOOLS.

Manufactured by the Rust Well Auger COMPANY, OF MACON, MO.

AUGERS and DRILLS from best wrought iron and steel. Shafting is 2-inch gas pipe. Couplings are round plugs fitted inside the pipe. Drills fitted for rope or pole. All tools *warranted*, and sold for less money than can be got elsewhere.
Send for Circular. O. RUST, Macon, Mo.

PALACE RESTAURANT

218 Sansome St.

THE CALIFORNIA POWDER WORKS.

MANUFACTURERS OF

Sporting, Cannon, Mining, Blasting and

HERCULES POWDER

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

It derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

No. 1 XX is the Strongest Explosive Known.
No. 2 is superior to any powder of that grade.

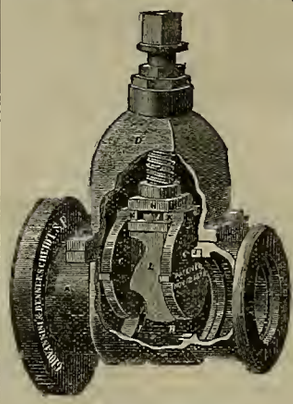
PATENTED IN THE UNITED STATES PATENT OFFICE.

ORDERS RECEIVED FOR HERCULES CAPS AND FUSE.

JOHN F. LOHSE, SEC'Y.

Office, No. 230 California Street, - - San Francisco, Cal.

Union Brass Foundry and Mechanical Work Shop.



GIOVANNINI & CO.,

417 and 419 Mission Street, - - SAN FRANCISCO.

The attention of our customers and especially of those interested in Water Works, Gas Works or Mines is respectfully called to our very important improvement in the construction of Stop Valves (or Gates). They differ from all others in that the inner faces are perfectly parallel, therefore when the Gate or Valve is to be opened, at the first movement of the screw the center block (see cut) releases the disks from their bearings, so that they will move easily and prevent the wearing of the inner faces.
This Gate has proved very efficient in Pipes of all sizes, and under any pressure and from its double form and perfect joint formation is especially valuable for use in large Pipes for water, steam and gas, and from its avoidance of any wedge shape cannot jam at any point (see cut).
The **G. & B. Valves** (or Gates) have no equal in simplicity of construction of all working parts, ease of access for repairs, and durability.
We have recently enlarged and fitted up our Brass Foundry and Shop with all the latest improved Tools and Machinery, thus greatly increasing our facilities for rapidly executing orders for all sizes of Stop Valves (or Gates) from three-inch to four feet in diameter, or any size, to order. We guarantee them to give better satisfaction, cost less money, and last longer than any other Valve in use.
We are also prepared to execute all orders in Brass Work for Breweries, Distilleries, Plumbers, Gas and Mining Apparatus, Ship Work, Soda Apparatus, Steam Fittings, Meters, Gauges and Indicators. Also in Machine Pattern and Model Making, and Clock Work. Gear cut to order. Brass Castings of all kinds. We are confident of our ability, and all orders entrusted to us will be executed with promptness and dispatch.

SAVE YOUR GOLD!

Highly Important to Miners and Quartz Mill Men!

SILVER PLATED AMALGAMATING PLATES.

The best process yet discovered for saving fine or float gold. Extensively used with great success in gravel and placer mining in various parts of the Pacific Coast. Over five hundred orders have been filled, and the demand is constantly increasing. A large number of these Plates were sent to Snake River mines, Idaho, last year, and a great many orders are being filled for them this season. Circulars containing full instructions for working these Plates sent with each order. Old Mining Plates bought or taken in exchange for new Silver Plated Plates, and full value allowed. Gold extracted from old Plates at a moderate cost by a new and economical process. Old Plates (which often contain a surplus of gold above the cost of plating) can be re-plated.
With the most extensive facilities on the Pacific Coast, orders can be filled very promptly and satisfaction guaranteed.
Mining Men and the public generally are cautioned against unprincipled and irresponsible parties traveling through the country, endeavoring to secure orders for very inferior qualities of Silver Plated Mining Plates.

Ingersoll Rock Drills.

In use in the largest and best Mines of the Coast.

HAS AUTOMATIC FEED.

Has less Repairs.

Is Lighter and more Easily Adjusted than any other Drill.

Our DRY AIR COMPRESSORS are the most Economical Compressors in the Market.

MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.
The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

Continued from page 317.

the quartzite footwall. No material change to note. They are getting some very rich ore from near the surface of the south shaft, the old Hamburg shaft and from just above the end of the south drift on the 250 level.

FOURTH OF JULY.—During the week work throughout the mine has progressed as usual. About 50 ft above the lower tunnel they discovered quite an extensive cave, the bottom of which shows some very rich ore. They commenced shipping ore to the Richmond furnace on the 1st instant.

PARADISE DISTRICT.

MINING ITEMS.—*Silver State*, May 12: A prospector named B. H. Davis has discovered rich ore about 75 miles south west of Paradise. The Arthur Con. has a 4-ft vein of ore, which averages $50 per ton, in silver. The Arthur is supposed to be a continuation of the Big Prize. Messrs. Torrey and Ryan, principal owners of the Gulch mine, are developing a valuable piece of mining property. It is being prospected by both tunnel and shaft. The ledge is about three ft wide, and carries considerable horn and native silver, and some black sulphurets. Judge Harlan and Mr. Merchant have just returned from a visit to the Giant mine. Judge Harlan, a first-class assayer, states that samples brought in will assay over 40% copper and about $30 in silver.

SILVER STATE DISTRICT.

GENERAL NOTES.—*Silver State*, May 12: This district is situated in a range of mountains which rune north and south, parallel with the Winnemucca and Paradise range. Mineral-bearing viens have been discovered in three places, several miles apart, in the district. The central mines, comprising the Silver Bill, Blue Bell, Blue Jay, Evening Star, Flora Bell, Chloride and several other locations, are situated in Lewis hill. The ledges crop out boldly, and can be traced a considerable distance on the surface. An incline shaft, some 25 or 30 ft deep was sunk on the Blue Bell, by Col. Buel, who leased the location from the owners. The ore extracted was shipped to Winnemucca, but in consequence of a cave in the shaft, work has been suspended for the preeent. Two enterprising minere, Messrs. Bradley & Hunter, have leased the Blue Jay, and are extracting ore from the croppings, which is rich beyond all doubt. Some of this ore assorted and sacked for shipment, is expected to mill from $300 to $1,200 per ton. Nearly all the croppings contain more or less rich ore, but there is not sufficient work done to determine the value of any of the claims. About six miles north of Lewis hill, Messrs. Cook, Glidden & Rodda, are at work on the Rodda ledge, and four miles south of Lewis hill, Zack King and two or three others are at work. Mineral-bearing quartz is said to abound in the range, north and south, a distance of 20 miles or more, but no work of any consequence has been done anywhere in the district, or in the range, the greater part of which is yet unprospected.

ARIZONA.

GLOBE DISTRICT.—*Silver Belt*, May 8: The Cox & Coplin mine, if not already sold, will be taken at the figures named in the bond. It has developed richer ore and more of it than it showed at the date of the agreement of sale A gentleman who has some experience in mines was recently down in the Metamora, and expressed himself well pleased with the indications, and gives it as his opinion that it will develop into a valuable mine. The shaft is down 205 ft, at which depth water has appeared, which will necessitate proper machinery before going further. A crosscut has been run from the bottom of the shaft, and gives a distance between walle of eight ft and eight inches, and shows ore distributed throughout which gives good assays. Messrs. Riggs, Campbell and Newland, owners of the La Plata mine, Richmond basin, are down on the main ledge 55 ft, and have a vein carrying ore from wall to wall, seven ft. The ore is principally sulphurets, with native and ruby silver, and is similar in character to the King ore.

SAN XAVIER.—*Star*, May 10: Work on the San Xavier mines is progressing at a rapid rate. Enough men are employed to run both night and day shifts, and but few mines in Arizona can show an amount of development equal to these. One shaft is already down to a depth of 115 ft, and has drifts aggregating about 80 ft. This is called the "C" shaft, and is in mineral its entire depth, the vein at the bottom being 39 ft in width. On the dump at the mouth of this shaft are about 1,100 tons of ore. The "Union," or working shaft, is on the line dividing the Calabrasas and San Xavier property, and has already reached a depth of 100 ft. It is boarded or cased from top to bottom, the intention being to ultimately put in a hoisting cage. The third shaft has reached a depth of about 90 ft, and in its course has discovered some very rich ore bodies.

COLORADO.

KOKOMO.—Georgetown *Courier*, May 8: The Wheel of Fortune looks splendid, having a vein of ore from 6 to 19 ft thick. The ore is principally galena, with iron and copper pyrites mixed in it. The vein is very uneven and bunchy, and not at all like the Leadville deposits. Eddy & James, of Leadville, who have purchased the ore from this mine, claim that it is worth, delivered at the mill in Leadville, about $200 per ton. The mine is producing a large amount of ore, which is now piled up at the mine awaiting transportation facilities The Robinson mine has a vein from three to six ft thick, with the general characteristics of the Wheel of Fortune ore, except the grade is somewhat better. The ore purchased from this mine is worth, net, delivered in Leadville, about $250 per ton. Some fine specimens of carbonate ore have come from a claim above timber line, on Jack mountain, which belongs to one of the Keen boys. The vein is said to be 14 inches thick and assays from 40 to 150 ounces per ton. This is the only true carbonate ore in Ten Mile. Several very large veins of galena ore were discovered on Elk mountain lately, one of which is said to be 12 ft thick.

OREGON.

GOLD NOTES.—*Sentinel*, May 7: Nine German prospectors have returned from Silver creek, where they cached their provisions intending to return. They say the water is yet too high for successful mining. John Bolt still busy in Farris gulch, with plenty of water and better prospects for a larger clean-up than last year. J. T. Layton is running his pipe continuously in the same gulch. Mr. Frank Ennis, who has just returned from the English company's claim on Galice creek, states that a large amount of dirt has been washed, and that there will be sufficient water for a month's piping. Blue Gravel has been well worked this spring, a large amount of dirt having been moved. The gravel is looking very favorable for good pay and piping will probably be continued during this month. The claim of Lodge & McDonald, on "Jackass," will not be cleaned up this season, a cave having covered up all the washed ground just when the water failed, and it was impossible to wash it out. Their dust, however, will be perfectly safe. Mr. Dimick, of Dry diggings, is now engaged in cleaning up after the spring run. On Saturday he took one pan of dirt from the ground sluice and panned out four ounces of dust. The remainder of the ground sluice is apparently quite as good. George and Daniel Green are running two arastras steadily at their ledge on Galice creek. Their rock is averaging $30 per ton, with a large supply in sight. Water at the Centennial is failing, but the company struck their best pay just before the supply began to fail. A "Little Giant" will be put in operation next winter. The Applegate company is still pushing work on their ditch. The ditch, five miles in length, will be full of water by the 10th inst., but it will probably be three weeks before piping can be commenced.

THE recent rise in freights between Portland and San Francisco caused by the loss of the *Republic*, lowered the price of wheat at Walla Walla from 50 to 46 cents.

Now for the Results.

The proposed new Constitution was adopted at the election of May 7th by about 10,000 majority. The campaign for and against the instrument was full of excited discussion and the election was hotly contested. No recent issue in public affairs has stirred the people so deeply, and the result in a strife, where each side was fully awake and at work, cannot be regarded as otherwise than an expression of the unyielding determination of the people to put the new organic law into effect, hoping to reap therefrom many advantages. Thus we trust the future may prove.

The adoption of the new Constitution is one step in the course of affairs now in progress. It is not the end of the exciting series of events: it is rather the beginning. Just at this moment, as the popular mind and thought are resting from the excitement of the last two months, and before the excitements attendant upon the fall's elections begin, we have a few words of a general nature to express.

It is a hopeful sign, that, even though the direst evils were anticipated by the opponents of the new Constitution before the election, since the issue has been settled the disposition of all is to accept the popular verdict and take an earnest hold to realize all the good which the situation can afford. The confidence in the future of the State and the continued prosperity of the people, is unshaken even among those who prophesied greatest evils. Both those who regarded the new instrument as the ægis of a better and truer industrial future, and those who feared it as a harbinger of evil, are now striking hands in true patriotism and citizenship and agreeing, one with another, to labor toward the attainment of the greatest public good which may be found possible under the new order of affairs. This is a sign of a true heart and purpose, although opinions of means and measures were at variance; and this is the surety of success in all popular governments.

We have said the adoption of the new Constitution is but the beginning of the end. Much, indeed, depends upon the events of the coming months and the manner in which the people address themselves to the discharge of the new duties which the new order imputes. In the first place there will be needed, among all well-minded citizens, a spirit of true conservatism to check the too radical tendencies which are cropping out and which plume themselves for flights which the present expression of the popular will does not warrant. Another genius of good which should be generally invoked is the spirit of moderation. Half the promising deeds in this world are ruined by overdoing. As the clash of interests, endeavoring to readjust themselves under the new order of affairs, is in progress, there will be many occasions for the exercise of the sublime principle of the Golden Rule. There will also be many chances for the vengeful work of spite, but he is not a friend of humanity nor of the State who allows his actions to be prompted by narrow, selfish aims. The time demands the broadest charity, the deepest, truest philanthropy from all of us.

But there is a special demand of this time upon which will rest nearly all the good or all the evil of our immediate future. The people have declared the principles which shall govern them; now men must be chosen to give these principles application in the form of laws, and execution in the acts of public officers. It is *men*, therefore, which the exigency of the time demands; men of unimpeachable integrity, of sound judgment, of correct views, of unyielding principle, of solid, practical sense and wisdom. If the coming elections shall give us these, there is little doubt but that our new life will be a better life, and that the decisive step which has just been so decisively taken will be a step in advance—the entrance to an era of general prosperity, better than any prosperity we have hitherto enjoyed. Let us then urge upon all our readers this great need of the time, and beseech them to relax no exertion which promises to secure to the State the faithful servants which her exigencies require. We cannot follow our friends into the several organizations which they will form to express their views by the aid of party machinery and methods, but, now, standing upon the verge of the contest we can well exhort all to make their standards of requirements in the men they shall nominate for office, very high and exacting. Let no man's aspirations mislead anyone, rather seek out those who are well fitted to discharge the high and important duty which just now presses.

If this safeguard be assured, the future will be safe. Just as any system of government may be made oppressive by placing the power in the hands of designing and unscrupulous men, so may the new regime in this State be made oppressive by the same agencies if they be permitted to succeed. As the issue which culminated May 7th awakened the keenest interest and secured independent action on the part of the great industrial masses of the State, so let the coming events receive their fullest watchfulness and most patriotic effort. Take nothing for granted. "Prove all things; hold fast that which is good," is the principle which should prevail in the choice of men for the people's representatives. It would be time well spent if the chief thought of the people during the next three months should be centered on this great need of the State. Let our disposition be that which Cicero described as characteristic of the best days of the Roman republic, in that it was the unceasing care of the citizens that the State should receive no detriment.

News in Brief.

INDIA is recovering from the cholera.

THE jury in the Duncan case disagreed.

RENO is to have a large woolen manufactory.

THE Chinese are being whipped in Kashgar.

VIRGINIA CITY had a snow storm on the 11th.

THE price of wheat is still rising in Spain.

KENTUCKY desires the return of the whipping post.

THE grasshoppers have invaded Washoe county.

SHEEP-SHEARING is in progress in southern Oregon.

WATER has already failed in many Oregon claims.

THIEVES have stolen a saw-mill in Fulton county, Pa.

YAKOOB KHAN has accepted all the British proposals.

A GERMAN gunboat also is to be stationed in Chilean waters.

THE President has vetoed the Military Interference bill.

THE honey crop of southern California will be small this year.

TIMBER is suffering from forest fires around Scranton, Penn.

CHEYENNE sentences convicted tramps to six months at hard labor.

FROM 9,000 to 10,000 gallons of brandy are in store at St. Helena.

A CHINESE legation is to be permanently established at Madrid.

SAN LUIS OBISPO has a potato weighing over eight pounds and a quarter.

A SEVERE frost has injured the tender vegetation in Santa Clara valley.

NEAR Parma, Italy, 15 farm houses have been destroyed by a land slide.

THE threatened white raid on Indian Territory has nearly come to an end.

LAST year, 51,592 Ohioans were married and 1,097 divorces were granted.

THE lumber business in Mendocino county looks somewhat discouraging.

MOHAMMEDANS are plundering the shops in Adrianople on account of hunger.

THE proposed Woodruff Scientific expedition has collapsed for want of funds.

INDIAN AGENT MILROY has granted two divorces on the Puyallup reservation.

SWIMMING is a requirement with all candidates for the English naval service.

THE rigor of the last winter has largely increased the number of beggers in Paris.

FROSTS have destroyed the prospects of a good fruit crop in Honey Lake valley, Nev.

THE late rains have made good feed in the foothills on White river, Tulare county.

WOODEN water pips manufactured on Puget sound is constantly shipped to California.

THE British War office calls for 1,200 volunteers from the regular army, for the Cape.

FISHERMEN on the Sacramento report the run of salmon much better this year than last.

THE volunteer hay crop on the river lands in Napa county averages five tons to the acre.

THE bees in the burnt district of the Cahuenga mountains are dying off very fast with dysentery.

SAN JOSE Chinamen have built an impregnable gambling house, and now defy conviction under the law.

THE wool market in northern California is becoming more active. Averags shipment last week 141,200 pounds.

THE PACIFIC COAST IN THE SPANISH LANGUAGE.—We have received a copy of *La Revista del Comercio, Precios-Corrientes y Cicerone de California y Los Estados y Territorios Adyacentes.* It is a San Francisco publication by Messrs. Casanova, Fairbanks & Co., and is a handsome monthly in pamphlet form giving information as its name implies, and ie for circulation in the Spanish States of America. The journal will endeavor to turn the trade of the southern countries in our direction, a result which would be of great advantage to our productive and mercantile interests.

Back Numbers Wanted.

The following volumes and single copies of the MINING AND SCIENTIFIC PRESS are wanted at this office, for which a reasonable price is offered:

Year.	Volume.	
1870	20	2 Complete volumes, 1st half (of year).
1870	20	2 Copies of No. 2, Jan. 1st.
1870	20	1 Copy each of No. 1, Jan 1st, 3 of Jan. 14th, 7 Feb. 11th, 6 Feb. 4th.
1870	21	1 Copy of No. 7, August 13th.
1871	22	5 Copies of No. 1, Jan. 7th.
1871	22	3 Copies of No. 5, Feb. 4th.
1871	22	1 Copy of No 3, Jan. 21st, 6 of Feb. 2d, and 1 of May 1st.
1871	23	1 Copy of No. 2, July 15th, and 9 Sept. 2d.
1872	24	2 Copies of No. 4. Jan. 27th.
1872	24	3 Copies of No. 7, Feb. 17th.
1872	24	3 Copies of No. 17, April 27th.
1872	25	2 Complete volumes, last half (of year).
1873	26	4 Copies of No. 8, Feb 22d.
1873	26	3 Copies of No. 9, March 1st.
1873	26	4 Copies of No. 10, March 8th.
1873	26	2 Copies of No. 7, Feb. 15th.
1873	26	1 Copy of No. 6, Feb. 8th.
1873	27	4 Copies of No. 20, Nov. 15th.
1873	27	5 Copies of No. 21, Nov. 22d.
1873	27	4 Copies of No. 24, Dec. 13th.
1875	30	2 Copies of No. 4, Jan. 23rd.
1875	30	2 Copies of No. 5. Jan. 30th.
1875	30	1 Copy of No. 6, Feb. 6th.
1875	30	2 Copies of No. 8, Feb. 20th.

PATENTS AND INVENTIONS.

List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS TO DEWEY & CO.'S MINING AND SCIENTIFIC PRESS PATENT AGENCY.]

By Special Dispatch from Washington. D. C.

FOR THE WEEK ENDING MAY 6TH, 1879,

STAMP BATTERY FOR QUARTZ MILLS—R. F. Bidwell, S. F.

MANUFACTURING OF BOOTS AND SHOES—Jos. Hohart, Nordhoff, Cal.

STAMP MILL—C. S. Stanchfield, Oakland, Cal.

CAR BRAKE—Nathan Webb, Sacramento, Cal.

DERRICK STAKE—R. P. Williams, Alameda, Cal.

CONVERTIBLE CHAIR—Frederick Janeen, Seattle Washington Territory.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

BEDLAM BROKE LOOSE.—Troubles multiply in Leadville. First, they had the winter with its frosts and snows, its overcrowding, starvation and deadly maladies. Then faults in the mines came to the surface—deposits too superficial and the ores of too low grade, lead out of all proportion to the gold and silver. And now anarchy prevails in the unfortunate camp. The adventurers, drawn thither through false and exaggerated reports, are wroth at the deception; and now, to get even with the crafty speculators who have beguiled them to ruin, are seizing upon the mines indiscriminately and holding them at the point of the six-shooter. Contention is the order of the day; lawsuits multiply and everything is involved in confusion and doubt. The outcome of this uproar and strife no one can forecast. Meantime, many are leaving disgusted with the place and its prospects, which can certainly be considered none of the brightest. It is a bad plan, this of overdoing things at the start. These Leadville villains might have learned as much and avoided these troubles had they studied carefully the history of mining on this coast and paid attention to its teachings.

RUST has made its appearance in Brown's valley, Napa county, and if the present weather continues, will affect the grain in Napa and Berryessa.

A WEALTHY San Francisco dentist has given $60,000 toward founding a college of Dental Surgery in connection with the University.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office at San Francisco:

GORDON CREEK M. CO.—Object: To operate in the county of Del Norte. Capital, $10,000,000. Directors—J. D. Gray, J. W. Musser, Spencer C. Brown, F. D. Brandow, J. W. Winslow.

VORTEX M. CO.—Capital, $6,000,000. Directors—Charles W. Fox, Alex. B. Brown, William H. Sears, George W. Fisher, G. A Miller.

FOULK G. & S. M. Co.—Object: To operate in Lake mining district, Mono county. Capital, $5,000,000. Directors—George W. Grayson, C. X. Hobbs, A. H. Rutherford, Thomas Bell, C. A. Burgess.

CHRYSOLITE M. Co.—Object: To operate in Mono county. Capital, $6,600,000. Directors—Robert F. Foley, Simon Reinhard, Henry Rosener, George R. Welle, Robert F. Morrow.

SOLANO ROMAN CEMENT Co.—Object: To manufacture, ship and sell cement. Capital, $60,000. Directors—J. K. Prior, J. G. Johnson, John Cochran, John G. Ayers and Horatio McPherson.

HERMIT G. & S. M. Co.—Object: To operate in Sierra county. Capital, $6,000,000. Trustees—Herman E. Gliffen, John Tonkin, F. M. Biker, Fred. Schumacher, Nathaniel T. Messen, John T. Bacon and T. C. Boyd.

KNIGHT OF MALTA Q. M. Co.—Object: To operate in Nevada county. Capital, $5,000,000. Directors—B. B. Lee, A. B. Dibble, C. W. Smith, Samuel Granger and Samuel Moore.

JUSTICE CON. G. M. Co.—Object: To operate in Lawrence county, Dakota Territory. Capital, $10,000,000. Directors—R. N. Graves, A. Borland, A. Hemme, George D. Haven and Homer S. King.

GOLDEN GATE M. Co.—Object: To operate in Lawrence county, Dakota Territory. Capital, $10,000,000. Directors—R. N. Graves, A. Borland, A Hemme, George D. Haven and Homer S. King.

NELSON G. & S. M. Co.—Object: To mine in Plumas county. Capital, $10,000,000. Directors—Archie Borland, A. Hemme, R. N. Graves, T. B. Kent and H. F. Morken.

HOW TO STOP THIS PAPER.—It is not a herculean task to stop this paper. Notify the publishers by letter. If it comes beyond the time desired you can depend upon it we do not know that the subscriber wants it stopped. So be sure and send us notice by *letter*.

FRESH attractions are constantly added to **Woodward's Gardens**, among which is Prof. Gruber's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

EXAMINE the accelerative endowment plan, as originated by the Mutual Benefit Life Insurance Co., of Newark, New Jersey. Assets, $30,533,429.94. Lewis C. Grover, President; L. Spencer Coble, Vice-President; Benjamin C. Miller, Treasurer; Edward A. Strong, Secretary; Bloomfield J. Miller, Actuary. Send for circulars to James Munsell, Jr., agent of insured, 215 Sansome St., San Francisco.

A CLERK who has had good experience in the dry goods and grocery business, wishes a situation. Will give substantial and satisfactory reference and accept a moderate salary and "work up." Address "Clerk," at this office.

EXPERIMENTAL MACHINERY, drawings, patterns, models, all kinds of electrical and telegraphic apparatus to order. See ad. F. W. FULLER, 415 Market St., second floor, S. F.

DEWEY & CO'S

SCIENTIFIC PRESS

Patent Agency.

SCIENTIFIC PRESS—Mining and Mechanical.

PACIFIC RURAL PRESS—Agricultural.

PATENTS obtained promptly; Caveats filed expeditiously Patent re-issues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons, and our success and business are constantly increasing.

The ablest and most experienced inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

Mining and Other Companies.

Persone interested in incorporated sharee will do well to recommend the publication of the official noticee of their companiee in thie paper, as tho cheapest appropriate medium for the same.

Rocky Point Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Placer county, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 17th day of April, 1879, an assessment (No. 1) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin to the Secretary, at the office of the Company, No. 314 Bush street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 29th day of May, 1879, will be delinquent, and advertised for sale at auction; and unless payment is made before, will be sold on Monday, the 16th day of June, 1879, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Directors.

T. L. BIBBINS, Secretary.

Office, 314 Bush Street, San Francisco, Cal.

Mount Jefferson Milling and Mining Company—Location of principal place of business, San Francisco, California. Location of works, Garrote Mining District, Tuolumne county, California.

NOTICE.—There is delinquent upon the following described stock, on account of assessment (No. 6) levied on the 21st day of March, A. D., 1879, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amt.
Condee, G M, Trustee	32	3000	150 00
Condee, O M, Trustee for the Mount Jefferson M & M Co.	44	800	40 00
Condee, O M, Trustee for the Mount Jefferson M & M Co.	43	2000	100 00
Condee, G M, Trustee for the Mount Jefferson M & M Co.	49	2000	100 00
Condee, G M, Trustee for the Mount Jefferson M & M Co.	50	2000	100 00
Condee, G M, Trustee for the Mount Jefferson M & M Co.	51	2000	100 00
Condee, O M, Trustee for the Mount Jefferson M & M Co.	54	1000	50 00
Condee, O M, Trustee for the Mount Jefferson M & M Co.	55	1000	50 00
Condee, O M, Trustee for the Mount Jefferson M & M Co.	58	11080	554 00
Fassett, N C	21	500	25 00
Fassett, N C	20	1000	50 00
Fassett, N C	22	500	25 00
Fassett, N C, Trustee	7	500	25 00
Fassett, N C, Trustee	8	500	25 00
Smith, O, Trustee	40	1000	50 00
Smith, O, Trustee	41	500	25 00
Smith, O, Trustee	42	500	25 00

And in accordance with law, and an order of the Board of Directors made on the 21st day of March, 1879, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the Company, on Tuesday, the 27th day of May, 1879, at the hour of three o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

R. N. VAN BRUNT, Secretary.

Office, 318 Pine street, Room 6, San Francisco, Cal.

BUY LAND

Where yon can get a crop every year; where you will make something every season; where you are sure of having a crop when prices are high; where you have a healthy place to live; where you can raise semi-tropical as well as other fruits; where you can raise a diversity of grain and vegetables and get a good price for them. Go and see the old Reading Grant (in the upper Sacramento Valley), and you will find such land for sale in sub-divisions to suit purchasers—at reasonable rates and on easy terms. Send stamp for map and circular to EDWARD FRISBIE, proprietor, (on the Grant), Anderson, Shasta Co., Cal.

Books for Miners and Millmen.

KUSTEL'S ROASTING OF GOLD AND SILVER ORES, and the extraction of their respective metals without quicksilver. Illustrated. 142 pages. 1870. A valuable and carefully written work. Postpaid, $2.50. Published and sold by Dewey & Co., S. F.

KUSTEL'S CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for gold-bearing sulphurets-arseniurets, and gold and silver ores generally, with 120 lithographic diagrams. 1867. This work is unequaled by any other published embracing the subjects treated. Post-paid, $7.50. Printed and sold by Dewey & Co., S. F.

PHILLIPS' EXPLORERS, MINERS AND METALLURGISTS COMPANION, comprising a practical exposition of the various departments of exploration, mining, engineering, assaying and metallurgy. 682 pages and 83 illustrations. A most valuable and comprehensive book of reference to prospectors and practical miners. Post-paid, $10.50. Published and sold by Dewey & Co., S. F.

AARON'S TESTING AND WORKING SILVER ORES.—Illustrated. 111 pages. 1876. A useful and practical work, free from technicalities and extremely serviceable for miners' use. Post-paid, $2. Published and sold by Dewey & Co., S. F.

COFF'S HANDBOOK OF MINING LAWS.—Containing the U. S. Mining Laws, Digest of Decisions, Forms, etc. 1877. Pocket size and very handy and convenient for miners. Post-paid, $1. Sold by Dewey & Co., S. F.

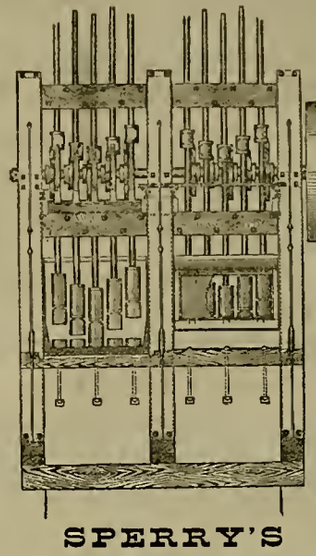
The Large Circulation of the MINING AND SCIENTIFIC PRESS extends throughout the mining districts of California, Nevada, Utah, Colorado, Arizona, Idaho, Montana, British Columbia, and to other parts of North and South America. Established in 1860, it has long been the leading Mining Journal of the continent, its varied and reliable contents giving it a character popular with both its reading and advertising patrons.

GOLD AND SILVER

Grinding and Amalgamating

MACHINERY.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chloridizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies.



SPERRY'S

Wrought-Iron Frame

FOR STAMP MILLS.

Great saving in time and money over the wood frame. Is made complete with wrought-iron frame ready to put upon the foundation, requiring no skilled millwright. These mills are unsurpassed in excellence in every particular.

We are furnishing all the Machinery for a 10-Stamp Gold Mill, including Crucible, Steel Shoes and Dies, Boiler and Engine, Counter Shafting, Pulleys, etc., Stamps weighing 450 lbs. each, with Copper Plate inside of the Mortars, and for tables outside, making all the Machinery complete for a 10-Stamp Mill for the sum of

$2,250.

We construct Mills with Stamps weighing from 350 to 900 lbs. for gold or Silver Ores. Wet or dry Crushing Mortars. Will contract to erect complete Gold and Silver Mills on the most improved plans. We have 30 years' experience in mining and milling Gold and Silver Ores, and can compete with the world. Send for a circular. Address

MOREY & SPERRY,

No. 145 Broadway, - - NEW YORK.

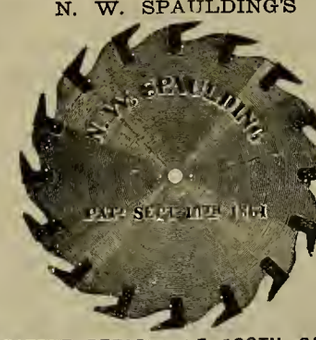
DESIRABLE OFFICES TO LET.

We have several sunny Rooms (lately occupied by A. W. Bowman and associates), adjoining the Mining and Scientific Press Patent Agency, at No. 202 Sansome street, corner of Pine, which we will rent permanently on very reasonable terms. Parties desiring pleasant office rooms should call and see them.

DEWEY & CO.,

No. 202 Sansome Street, May 15th, 1879.

N. W. SPAULDING'S



PATENT DETACHABLE TOOTH SAWS,

Manufactory. 17 & 19 Fremont St., S. F.

C. C. Bitner's Apparatus for Obtaining Metallic Copper from its Solutions.

Patented March 18th, 1879. Will precipitate with steam in three hours, requiring no machinery to run it. Cost of constructing apparatus, $75. The old cylinder process takes four hours to precipitate and costs from $1,200 to $1,500 to construct, besides the machinery to run it. For right to use my Precipitator address O. C. BITNER, Spenceville, Nevada County, California.

NOTICE

TO THE

MINING PUBLIC.

MESSRS. RANKIN, BRAYTON & CO., of the Pacific Iron Works, are the only parties authorized to manufacture HOWELL'S IMPROVED WHITE FURNACE under the License of this Company.

THE STETEFELDT FURNACE CO.,

By C. A. STETEFELDT, President.

Referring to the above, the undersigned would call attention to the fact that by a compromise recently effected with the STETEFELDT FURNACE COMPANY, they have secured the use of all the patents of said Company applying to

Revolving Cylinder Furnaces,

And are thus enabled to give purchasers the license of all patent claimants, to-wit:

WHITE, HOWELL, THOMPSON,

— AND THE —

Stetefeldt Furnace Company,

Thereby avoiding all further litigation in reference to these rival claims. The great

SUPERIORITY OF THE FURNACES

Embracing these patents has been satisfactorily demonstrated. There are now some thirty of them in operation in the various mining districts of the coast, operating in all cases with economy and satisfaction, working in many localities

THE BASEST AND MOST REFRACTORY ORES UP TO 90 AND 95 PER CENT.

By an improvement—the patent for which has recently been allowed—this Furnace can be readily adjusted so as to work with equal facility and effectiveness all classes of ores.

The following are some of the Mining Companies who have recently adopted this Furnace, the most of which are now in successful operation, many of them running two and some three and four Furnaces.

NEVADA.—Grand Prize, Star, Martin White, Highbridge, Columbia, Alexander, Paradise Valley, Jefferson, Leopard, Eagle, Endowment, Independence.

ARIZONA.—Tiptop, Tiger, Peck, Hackberry, Corbio, Tombstone, Bradshaw.

OREGON—Monumental.

MONTANA—Alice Mine, Butte City.

MEXICO—Trinidad, Harmiguera, Plomoses.

PERU—Cerro de Dasco.

RANKIN, BRAYTON & CO.,

Pacific Iron Works.

CAUTION.—All persons are hereby cautioned against buying from other parties Furnaces embracing the improvements covered by the patents above mentioned, as they will be vigorously prosecuted and involved in heavy damages.

THE SAFETY POWDER COMPANY,

San Francisco, Cal.

CARTRIDGE.

GEN. W. S. ROSECRANS.
President.

Fuse Lighter and Fuse.

COL. SAM'L O. GREGORY,
Secretary.

Safety Cap and Fuse.

Electric Cap.

Safety Powder, Caps, Electric Caps, and Fuse Lighters.

Under a series of U. S. Patents, after long and carefully conducted experiments and thousands of tests, this Company is prepared to manufacture and supply, for Mining and Engineering Works, the above named articles at prices and on terms as favorable as articles of similar grades are now supplied in this market. Our Powders contain no Nitro-glycerine, no Nitroline, no Gun Cotton, no Fulminates, and are free from the unavoidable dangers in manufacturing transporting, handling and using of all high grade explosives which contain those elements.

Cold does not affect them. They cause no headaches or other inconveniences in handling, and the smoke from their explosion contains no poisoning or sickening vapors.

Their blasting force, with slight tamping, at least equals that of any Powders now used, but they admit and require strong tamping to bring out their immense and peculiar lifting power which follows their detonating work. They should be fired, therefore, by our

Safety Cap,

Which allows tamping without danger. They can be fired by any caps now employed in blasting, but the use of these is always dangerous with any Powder, and the loss of the throwing power resulting from lack of tamping renders it with our Powders doubly objectionable.

Our SAFETY CAPS have twice or thrice the force of triple Giant Caps. When set on fire they do not explode, but merely burn off, and are perfectly safe in transportiug aud in tamping.

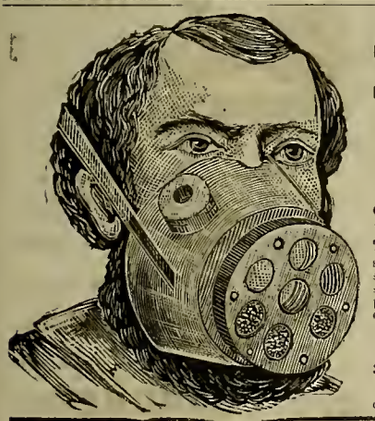
In round tin boxes, 50 cents.

The Safety Fuse Lighter,

Cheap, handy and sure to light the Fuse upon the end of which it is fastened, only needs a trial to be appreciated by every miner who is up to "snuffs." 25 Cents per box; sent by mail.

Safety Fuse,

Equal to the best in the market, will be supplied at the lowest market prices.



— PATENT —

LIFE-SAVING RESPIRATOR

Prevents Lead Poisoning and Salivation.

INVALUABLE to those engaged in Dry Crushing Quartz Mills, Quicksilver Mines, Guano Works, White Lead Corroding, Feeding Threshing Machines and all occupations where the surrounding atmosphere is filled with dust, obnoxious smells or poisonous vapors. The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price $3 each, or $30 per dozen. Sent post-paid to any address upon receipt of price

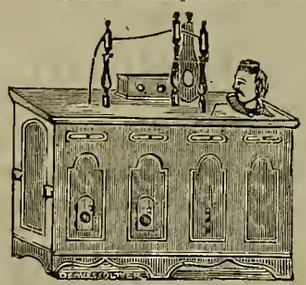
Treatment by a Purely Scientific and Rational Method Without Drugs of any Kind.

THE TREATMENT DEPARTMENT EMBRACES ALL APPROVED REMEDIAL AGENTS, AS OXYGEN INHALATIONS, VACUUM TREATMENT, THERMO-ELECTRIC, TURCO-AMERICAN, ELECTRO-MAGNETIC, GALVANO-CHEMICAL, STEAM, VAPOR, WARM AIR, AND ALL FORMS OF WATER BATHS;

Swedish Movements, The Health Lift, Spirometer or Lung Strengthener, Steam Atomizers, all Electric, Galvanic and Surgical Appliances, Sun Baths and Solar Ray Surgery, new and perfect Trusa for the Radical Cure of Hernia, lately discovered Chemical Compound for the speedy, safe, painless and permanent removal of Cancers, Scientific and successful method for the Cure of Piles, etc., etc.

☞ Aims to keep Abreast with, if not in advance of the Progressive Age. ☜



It has been the mission of this System to mold public sentiment, and this Institution will hope to be no disgrace to the immortal name it has assumed. The time has come when Physicians of this School can afford financially to keep a conscience; in fact it is disastrous financially as well as morally to compromise the truth one iota; hence patients can rest assured that they will be treated by the Physicians after the most approved and scientific methods, out of pure and enlightened selfishness, recognizing the truth and beauty of this great principle:

"The Universe is so ordered and arranged that the real and permanent good of every creature is best subserved in promoting the real and permanent good of every other being."

THE BOARDING DEPARTMENT.

The table will be supplied with the best the excelsior market of the world affords, embracing fruits, grains, vegetables, meats, fish, fowl, eggs, cream, etc. Regular and transient boarders will be accommodated as well as patients. Business and professional men and women who are tired of restaurant fare, may appreciate eating to live a more healthful and enjoyable life. Pure food means pure blood. Pure blood means good health.

"The vegetarian school has demonstrated beyond the possibility of a doubt that farinaceous dishes, sweet milk and fruit, are sufficient to maintain a *hard working* man in perfect health. Such a diet might certainly be substituted by sedentary people for their greasy steaks and ragouts.—*Popular Science Monthly, December, 1878.*

The Rooms are pleasant, warm, well ventilated and sunny; convenient to treatment rooms, so as to afford the best advantage of nursing and professional attendance.

GENERAL PRACTICE.

Fevers, and in fact all cases may be treated at home successfully. Paturition confinement cases are taken in the Institution or attended at home in any part of the city or country. Preparatory treatment in these cases is most important.

Testimonials of extraordinary cases and cures can be seen on application. The most desperate cases, and especially those that have been given up as incurable by the old methods, are invited. Puerperal and typhoid fever and diphtheria cases, after all other methods have failed, may be said to be a specialty. ☞ Send for the TRALL HEALTH JOURNAL.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers. SAN FRANCISCO, SATURDAY, MAY 24, 1879. VOLUME XXXVIII Number 21.

Geodetic and Astronomical Observations at Great Elevations.

Prof. George Davidson has started the Coast Survey geodetic and astronomical party to the field for the work of the season. He will occupy two stations of tbe main triangulation: The first, Lola mountain, on the Sierra, about 25 milee northwest of Trnckee and 9,500 feet above the ocean. The second cn Round Top, a station 10,600 feet above the eea, and lying southwest of Lake Tahoe, over the Carson canyon and Placerville road.

The work at these stations will embrace the measurement of tbe usual horizontal angles between distant stations; latitnde determinations and azimuth of the lines. Besides these will be made special observations for the determination of the coefficient of refraction, magnetic and meteorological observations to study the law of hourly change at high elevations.

The lines of sight will extend as far north as Mt. Shasta, west from Mt. Linn through Helena and Diablo to a more southern station, sonth as far as Mt. Dana, and 60 miles eastward of the Sierras.

In order to make special search for the problematical intra-mercurial planet or planets, Prof. Davidson has purchased a six and one-half inch equatorial objective, by Clark, and has had constrncted a portable equatorial observatory with a revolving dome of 12 feet diameter.

The details of the gas pipe dome have been capitally worked ont by Mr. Pratt, of the Coast Survey; and this is believed to be the lightest observatory and dome constructed. Tbe covering is of heavy canvas, and, it is believed, will resist the strongest winds of the Sierra.

This undertaking has been an especial object of Prof. Davidson since the spring of 1873, when he made his examinations of the fitness of high elevations for astronomical work, the results of which were then communicated to the Academy of Sciences. The experiments will consist in observing snch objects as are well-known tests for a given size of telescope at ordinary elevations, whilst hie lengthened stay at the two stations will enable him to form a just opinion of the general atmospheric conditions.

The results of all ohservations have confirmed the opinions of Prof. Davidson in regard to the peculiarly favorable fitness of our mountain ranges for the location of an observatory, and yet that no undue bias might seem to influence his judgment he advised in 1873 and 1874, that the same observer and the same instrument should be used at all available stations, from Summit to San Bernardino, so that a fair judgment could be formed.

In the present examination it is probable that a second observer will make in the valley, or on the coast line, simultaneous and similar observations upon the same object.

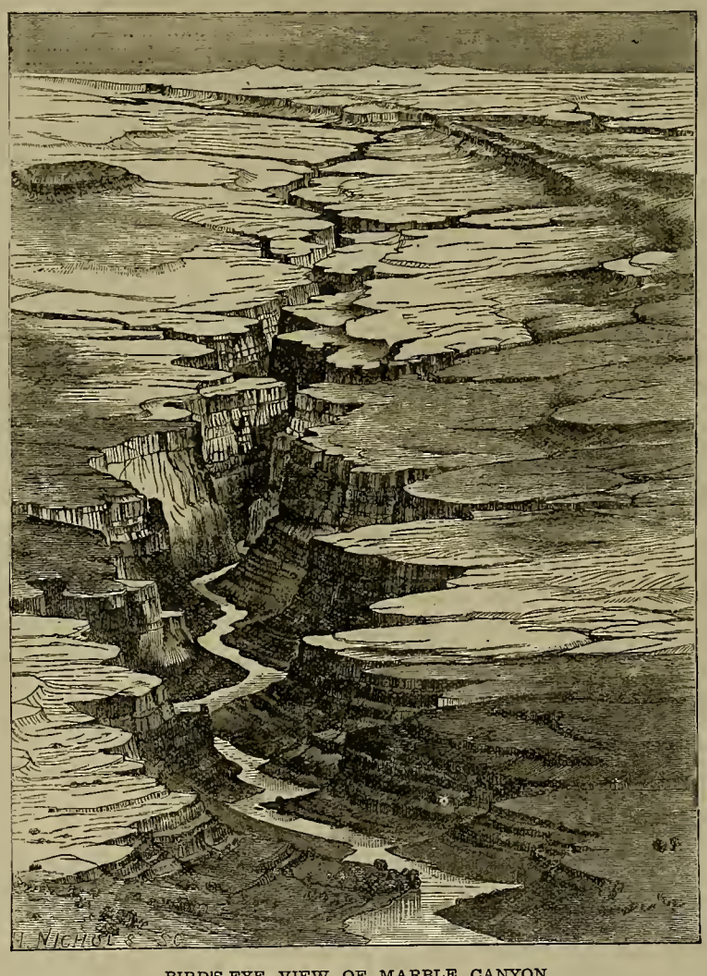
Although other investigations will be pursued, so far as time will permit, it is premature to announce them, as bad weather may mar some of the projected work. The lahors of the party will extend to the end of October.

After a Long Time.—For a number of years past several companies of miners have been engaged opening a series of ore-bearing veins in Alturas county, Idaho, the driving of lengthy tunnels haviug been among the means adopted to that end. The work has been a heavy and costly one, and success long delayed. We infer from what we see in the Idaho papers that these hardy men, the most of whom were Californians, have begun to reap some reward at last, several handsome bullion shipments having lately been made from these mines. What has tended to retard mining in that section of country has been its remoteness from lines of cheap transportation. Through the extension of the Utah Northern railroad this obstacle will soon be in good measure removed. The route of that road as determined upon will be across Big Camas prairie, skirting the Alturas mountains and thence down the Boise, passing within 28 miles of Rocky Bar, the site of these mining operations.

Marble Canyon.

In Powell's "Exploration of the Colorado River of the West," is given a view of Marble canyon from the Vermilion cliffs near the mouth of the Paria. This engraving is also given in Le Conte'e "Elements of Geology" (Appleton & Co.), from which we take it. In the distance, the Colorado river is seen to turn to the west, where its gorge divides the twin plateaus. On the right is seeu the Eastern Kaibab displacements, appearing as folds, and, further in the distance, as faults.

The general surface of tbe country between the mouth of the Paria and that of the Colorado



BIRD'S-EYE VIEW OF MARBLE CANYON.

Chiquite, is the summit of the carboniferous formation. At the mouth of the Paria, this is at the waters edge; at the mouth of the Colorado Chiquite, it is 3,800 feet above the river. The fall of the river, in the same distance, is about 600 feet, so that the whole dip of the rock hetween the two points is about 3,200 feet. The distance by river is 65 miles; in a direct line, 20 miles less. We have therefore a dip of 3,200 feet in 45 miles, or about 70 feet to a mile. The slope of the country to tbe north is the same as the dip of the heds, for the country rises to the south as the beds rise to the south.

Stand on the Vermilion cliffs, at the head of Marhle canyon, and look off down the river, over a stretch of country that steadily rises in the distance, until it reaches an altitude far ahove even the elevated point of observation, and then see meandering through it to the south of the gorge in which the river runs, everywhere breaking down with a sharp brink, and in the perspective the summits of the walls appearing to approach until they are merged in a black line, and you can hardly resist the thought that the river hurrows into, and is lost under, the great inclined plateau.

Another Aged but Well Preserved Pioneer Gold Finder.—An Eastern paper, after commenting on the injustice we do Gen. Sutter in refusing to suitably reward him as the discoverer of gold in California, goes on to remark that Bernardo Treres, who first found gold in Arizona, has been suffered to go equally unrewarded. Seeing that gold mines have hecn worked in Arizona by the Spaniards for several centuries, as they were worked probably by the Aztecs a good while before, this Bernardo Treres must be a person now well advanced in years, such protracted longevity being due doubtless to the fact of his "keeping a miserable tavern," which business, according to the above authority, he is at present engaged in. It may by the way be observed, that it was not Gen. Sutter hut James W. Marshall who picked up the first piece of gold found in California. Marshall heing old and poor should now get him a stock of arguardente and open a "miserable tavern," and thus place himself in the recognized category of original gold finders.

Kern and Inyo Counties. — Mr. Milton Kennedy will visit Kern and Inyo counties during the next few weeks, in the interest of the Press. We request our readers in those counties to aid and advance him in his work, as their disposition and convenience may suggest.

Eastern Investors in Pacific Coast Mines.

We had the pleasure of a conversation this week with Prof. W. P. Blake, a gentleman who is well-known by reputation at least, to all of our mining readers, and who rcently came from the East for the purpose of visiting the Arizona mining regions. He has just returned from Arizona, and has now gone on a tour to Amador and northern mines. He expresses himself as well pleased with what he has seen of Arizona, but like others, considers it as yet a poor country for a poor man to emigrate to. At present little can be done there except by associated capital towards the development of mining property, everything being so expensive.

In talking with Prof. Blake we find ho agrees with us in remarks we have repeatedly made with regard to parties buying small parcels of stock in mines of which they have no knowledge and over which they have no control. He says that in many of the Eastern States there are persons traveling about selling stock in Pacific coast mines to persons in the cities, small towns, farms, etc., in an indiscriminate manner which will surely work injury to those foolish enough to invest, on the representations of persons whom they do not know. Great expectations are held out about large dividends, and the isolated example of the "honanza kings" quoted as of every day occurrence among mining men. People with no knowledge of mines are apt to be led off hy such represeutations, and invest their money foolishly.

In Arizona there are a great many mines with small veins of rich ore, which assay up into the thousands. Selected samples are taken and assayed, and the certificates of assay exhibited as if showing an average of the ore. This sort of thing fools our own people here, and will surely take in those not acquainted with mining matters. Prof. Blake thinks our coast papers should warn Eastern investors of the danger they run in huying such stock without knowing anything ahout it. Wheu stock in a mining company is scattered ahout in small lots in tbis way, there is almost always sure to be a loss. No one has stock enough to take the proper interest to see the affairs run or managed in an economical manner, and finally all hands lose their money.

There is a large field for investors here in California, he thinks, in legitimate mining operations, where a few men may huy and work a mine without any stock manipulating. We are glad to find that our opinions on this subject are seconded hy an authority like Prof. Blake; and hope that our contemporaries will lend their aid in preventing any reckless investments of Eastern capital in projects which to say the least are douhtful, in view of the way in which they are put before the public.

Copper Mining. — The copper mines at Spenceville, Nevada county, are being worked quite actively, notwithstanding the prevailing low prices for that ore. Monthly ore shipments are made from these mines to the value of $9,000. The ore here, which carries about 30% of metal, is sent to this city and marketed at a good price. The owners talk of reducing the ore at the mines, by a process that will bring the metal first iuto a liquid state. We note also increased stir in the copper mines of Calaveras, Del Norte and elsewhere in this State. In eastern Arizona, too, copper mining is being pushed with a vigor that deserves, as it no doubt will, command a large success.

A Search Along the Sierra.—Extending through Fresno, Tulare and Kern counties, there is thought to he a strong metalliferous helt lying pretty high up along the west slope of the Sierra. Some prospecting has been done here in times past which led to the discovery of promising ore-bearing lodes at one or two points, notably so in the Mineral King district. Fair assays in silver were obtained from these lodes, but these discoveries not having been followed up hy any thorough development, very little is known as to their actual value. Fresh parties having gone out with the purpose of giving this region a more extended examination, their report will be awaited with some interest and a general desire that it may be favorable.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds

Gold Fields in the Agricultural Counties of California.

Editors Press:—When we hear of gold fields something strikes our nerves resembling electricity, we never ask how much labor it takes to obtain sufficient gold to exchange for a $20 piece, the "fact" of gold or silver is sufficient to make the stir, and if anything like a show is made, as has been the case in Leadville, thousands go there, most of them losing their money instead of making any, and return generally broken in pocket, in health and spirit. Up to late years one good quality has been indisputable in hotb gold and silver, the producer of it had not to look for a market; but lately even this cannot he said of silver, because it has become a drug on the market.

Within the last ten years there have been hut two articles produced of which the demand has been greater than the supply, these have been gold and sugar.

The United States of America bas to ship every year one hundred million dollars in gold to exchange for her supply of sugar, eighty millions of this going to Cuba. The "Pearl of the Antilles" takes hardly anything in exchange from the United States hut her gold. Our consumption of sugar increases with our civilazation, England and the United States being the largest consumers of sugar in the world. Fifty years ago all the sugar consumed in the world, with trifling exceptions, was cane sugar, but since then beet sugar has appeared on the market of the world and made such an immense progress that last year more than one-half of all the sugar in the world was produced from the sugar beet. Bearing this fact in mind, it cannot surprise anyhody that the sugarie industry in France and Germany is of greater importance to those countries than any other industry of whatever nature.

The comparatively small island of Cuha produces annually the enormous sum of $250,000,000 in her sugar fields. Even the Sandwich ielands, which are mere specks in the Pacific ocean, come in for a fair slice of all the gold produced in California, their sugar fields yielding the dollars fully as surely as our gold mines.

What good then does our gold and silver mining do us, when we ship all our mines yield us and more out of the country in exchange for one single article, which is indispensable and which we do not produce? And strange to say the United States is more favorably situated to produce large quantities of sugar than any other nation on the globe. Cuba and the Sandwich islands are not excepted, for it is a long established and acknowledged fact that one acre cultivated in sugar heets produces more sugar than the same quality of ground cultivated in sugar cane.

Within the last 12 months 14 corporations have heen organized for the manufacture of sugar from heets in the eastern part of the United States, and Canada. In former years several attempts had heen made to introduce the heet sugar industry in California, and this ie the less surprising, as there is uo State in the Union so favorably situated, or possesses a soil and climate which could stand any comparisons with California. Yet notwithstanding these great advantages, notwitbstanding the fact tbat when properly inaugurated the agricultural part of California could produce more dollars from the sugar heet fields than all the gold and silver minee on the Pacific coast combined, while, like any other country where the heet sugar industry has found a home, California need not produce one bushel of grain less—in fact, it naturally would increase in every other agricultural product, while she could produce a hundred million of dollars in sugar beet fields.

The attempts at beet eugar production so far have not heen successful in California. Three sugar factoriee bave been estahlisbed, and it is hut rigbt to inquire into the causee wbich interfered with their success. But before going into the details of these experiments, it should he distinctly stated, what every farmer no doubt is aware of, that beets can he raised in California in unlimited quantitics, and even at a reasonahle price will yield the farmer larger cash returns than any other crop he can raise. The quality of the beets is certainly ahove tbe average, they being by far superior to those grown in France, and almost as good as the best in Bohemia and Germany, and with experience in proper cultivation will still improve. I have analyzed (polarized) some beets on tbe first day of May. They had been during the whole winter lyiug in opeu pile exposed to the weather, the late warm spell and the sun having wilted them to some extent. The result was as follows: Specific gravity of juice hy Balling's per cent. meter, 23.00; sugar in the same, 17.50; co-efficient of purity, 76.09. Of course the large amount of soluhle matter in the juice was partly caused hy evaporation of water, hut even making due allowance for their wilted state, these beets were even on the first day of May superior to any beets I bad worked or analyzed during last winter in tbe State of Maine.

As the large production of beets and the good quality of the same for sugar production has never beeu doubted aud is an admitted fact, it is useless to say more about it at present, hut the question remains to be answered, wbat tben have been the causes of so indifferent success of these tbree sugar works? I propounded these questions to several parties before I came to California, and received the following answers: "Incompetency and dishonesty on the part of those who were entrusted witb the erection and management of the sugar works," was tbe reply of one party. Tho other stated he was satisbed one was built to facilitate the sale of land, the other to swindle, and that both accomplisbed wbat tbey were intended for.

The first party might be answered that two German sugar manufacturers have been here whose reputation for capacity and integrity is acknowledged by those who are best able to judge; aud the second might be answered, that neither of all the beet sugar factories here, as they were first built, could have worked in any other part of the world. A beet sugar factory in California, in order to work successfully, wbicb is equivalent of earning a profit for its owners, must not ouly be a raw eugar factory, but a sugar refinery at the same time, and sucb au establishment cannot be built in Europe for either $15,000 or $75,000, as it has been attempted bere. It will be difficult to find a raw sugar factory in Europe which has not cost to erect over $100,000, but sucb an establishment has no ghost of a chance of success bere, because tbe interest of sugar refiners is in opposition to beet sugar manufacturers. The beginning tberefore in an insufficient way is a sure foundation to failure. Once started in tbis way, and all the patching and all the assessments which follow will not make it a success. Tbis has been the case witb the heet sugar manufactories in California. It makes no difference how much money they have finally lost, they did not invest enough in the etart. They have been penny wise and pound foolish, and if they had pursued tbe same course in the best beet sugar districts of the world, they would have met with as sure failure.

If hut one-tenth part of the money invested and sunk in Leadville had been invested in the heet sugar industry, an industry might have been started on a sound foundation, producing more dollars every year than all tbe gold and silver mines in tbe United States combined.

A new attempt is made tbis year to start at least one paying heet sugar factory in California. Of its progress and relation to farming in California, I will speak in another communication.

Ernest Th. Gennert.

The Solar Salt Marsh.

The Ogden *Freeman* publishes tbe following item relating to the wonderful salt marsh lying nortb of Pioche:

Eighty milee from Cherry Creek, on tbe line of Utah and Nevada, 20 miles south of the old overland stage road, is a wonderful and very productive salt mareb that is one and a balf miles wide hy four miles long. In the spring of tbe year this overflows from surplus water tbat comes from tbe eurrouuding country. There are some 200 fresh springs in and around tbis marsb, affording water good to drink. Of these springs none of them are more tban 100 yarde distant from the marsh. In the summer season the water evaporates, leaving a depoeit of salt from two inchee to one foot thick. The dietance from great Salt Lake is 175 miles, with mountain chains intervening. Last year 2,000 tons of salt was wagoned from this marsh to Cherry Creek, Ward, Pioche and Hamilton for use in reducing ores. It is worth $13 at the marsh and $20 at Cberry Creek, the neareet camp. The property is owned by tbe Solar Salt Co., composed of Judge Riley, M. J. O'Connor, Jobn O'Dougherty and William Barry. One contract made last fall to supply this salt at Ward amounted to tbe neat little sum of $35,000. In collecting the salt 7 white men and 13 Indians are employed. It costs $2 per ton to put it on wagons. The process of gathering it is to use little band scrapers to collect it in piles, from which it ie sboveled into dummy cars that run on a temporary track laid to solid ground, where it is transferred into wagons for shipment to the mining camps.

New Mode of Treating Caoutchouc.—To make caoutchouc indifferent to the action of oils and fats without impairing the otber properties of vulcanized ruhher, the following method is employed at the works of C. Schwanitz, Jr., at Berlin: The caoutchouc is worked hy heated rollers together with a mixture of six pounds of prepared chalk, one pound of glycerine of 1.23 sp. grains, one and two-thirds ounces of litbarge, and three and one-fifth ounces of eulphur. For vulcanizing the mass or the article formed thereof is placed in a hath of glycerine, and exposed to a steam pressure of from two to three atmospheres.—*Deutsche Gewerbe Zeitung.*

Glycerine in Food.—Catillon, a Frencb physiologist, found that the addition of from seven to eigbt grains of glycerine to the daily ration of a lot of Guinea pigs increased the effect of tbeir food so tbat they gained from one-tenth to one-fifth of their weight in a given time, while a second lot fed on the same ration, hut without glycerine, gained nothing; when the dose of glycerine was changed to the second lot they gained in weight, and the first lot gained nothing. Large doses of glyceriue, bowever, cause derangement of the digestive ergans.

Copper vs. Silver.

Which Can be Mined and Worked most Profitably?

In refereuce to my communication of January 16th, tbe following estimates will sbow what may he done by working the copper ores of tbis southern portion of the Territory; and it is really inexplicsble, with snch facts staring them in the face, that cspitalists should persistently ignore copper aad confine their operations to the more risky, though attrsctive, mining (and speculation) in gold and silver properties. Even our usually wide-awake prospectore apparently fail to perceive that copper ore assaying 25% is wortb $75 per ton, and is free from tbe drawbacks attending silver in the shape of a depreciated etandard, imperfect reduction, involving a loss of (say) 25%, besides loss of mercury, high rate of expressage, etc.

While ores as low as 8% may be worked by the Hunt & Douglas system, tbe high grades may be smelted, preferably, in water-jacket, copper-plated, or otber improved furnaces, or even shipped in the crude state wben exceeding 50%.

It should also be borne in mind that copper mines are not, as a rule, so liable to give out as those of silver or gold, wbile tbe metal is equally marketable. Its price also being now at a minimum, the prohahilities are greatly in favor of a rise ere long.

High-grade magnetic and hematite iron ores are found in the vicinity of many of our rich copper districts—often in immediate proximity with the copper mines tbemselves—whicb will furnish the material for producing the spongy iron required, in the absence of scrap iron, to precipitate tbe copper.

Estimate of capital required to purchase copper mines, erect plant, and work 20 tons of ore per day, by wet process:

PLANT.

For Copper—	
Pulverizer	$ 2,000
Furnace (roasting)	2,500
Tanks	3,000
Engine and boiler	5,000
Pumps and other small appliances	1,000
Buildings	1,000
Refining furnace	1,500
Hunt & Douglas' royalty	1,000
Office and assay fittings	500
For Sponge Iron—	
Crusher	2,000
Frue's concentrator	1,000
Retorts	1,500
Receivers, etc	500
Buildings	500
Total	$23,000

WORKING EXPENSES—PER DAY.

Labor—	
Superintendent	$ 20.00
Assayer and clerk	10.00
Foreman	8.00
Two engineers	10.00
Two assistants	6.00
Two grinders	6.00
Four roasters	12.00
Four smelters	12.00
Eight tank men	24.00
Material—	
Salt, 3,500 pounds	87.50
Iron, 7,500 pounds	187.50
Wood, 10 cords	50.00
Candles, oil, wear and tear, etc	20.00
Miscellaneous—	
Mining 20 tons per day	40.00
Hauling	100.00
Freight on 5 tons of copper to San Francisco, New York, or Liverpool, vla Gulf of California	250.00
Daily disbursements	$ 843.00
Five tons copper	1,500.00
Daily profits	$ 657.00

Or $32.85 profit per ton of ore.

CAPITAL REQUIRED.

To buy copper mines (say)	$25,000
Erect plant	23,000
Opening mines, road-making, and other preliminary expenses	16,740
First month's expenses	25,260
Total	$90,000

PROFITS.

On 12 months' working	$123,652
Deduct for contingencies, 50%	61,826
Net annual profit	$ 61,827

Which, on an outlay of $90,000, is 68.7% per annum.

Advantages of Copper over Silver Mining.

Silver is not being worked beyond 70% or 80% of its assay value, and when obtainod has to be sold at a discount of 20%, and pays in express changes and commissions another 5%—making a total deduction of (say) 50% from assay certificate—in addition to mining and reduction charges.

EXAMPLE—ASSAY VALUE, $100 PER TON.

Mining (say)	$ 2.00
Hauling	5.00
Reduction	30.00
Loss in reduction	25.00
Discount (20%)	15.00
Expressage, etc. (5%)	3.75
Total	$80.75

Leaving a profit of $19.25 per ton of ore.

Copper, on tbe other band, can he worked to ½% of its assay value, and is sold at its full market price without discount, paying ordinary merchandise freightage, being unattended with risk of rohhery.

Example—Assay value, as ahove estimates on 25% ore, $75 per ton; mining, bauling, reduction, add freight to market, $42.15—leaving a profit of $32.85 per ton (43.80%), or more tban double the profit ohtainable from silver ores of same assay value.—*W. T. Rickard, F. C. S., in Arizona Star.*

Birds of the Colorado Valley.

A recent government publicatiou of much value to the agricultural interest, as well as to ornithological science, is entitled "Birds of the Colorado Valley," by Elliott Coues, of the staff of tbe Hayden Survey. Tbis work is designed as complementary to the author's former treatise, "Birds of the Northwest," and is marked by tbe same thoroughness of execution and accuracy of detail characterising his many previous works, and must prove one of the most useful ae well as popular contributione to American ornithological ecieuce. In perusing the volume it is evident that tbe autbor's purpose of so divesting the biograpbical portion of tecbnicslity as to meet the tastes and wants of the general public bas been fully ohtained. Dr. Coues, wben he chooses to relax from the rigidity of purely ecientific etyle, possesses a bappy faculty of combining a scientific and pleasantly popular element in bis writings, and no one csn depict bird life with more vivacity and truthfulness than be. Often tbe reader will find it impossible to repress a smile in contemplating tbe serio-comic truthfulnese of his application of buman motives and characteristics to tbe birds, which, if he be at all familiar with them, will appeal forcihly to his own, perbaps unconsciously received impressions.

As implied in the title, most of the biograpbical portion of tbe work is limited to tbose species inhahiting that region drained by tbe Colorado river of tbe West and its tributaries, including Arizona, much of New Mexico, Utab and Nevada, a part of the State of Colorado, and some of southern California. All otber species, however, known to occur witbin the limits of the United States are synonomatically and descriptively treated, truly rendering the work "a repository of scientific and popular information concerning North America ornithology."

Of each species the syuonym is oxbaustively presented; tbis heing followed hy a complete external description, including sexual aud seasonal plumage variation, preceded hy a concise enumeration in Latin of diagnostic characters. The latter portion of the volume ie devoted to a "Bibliographical Appendix," or list of publications relating to North American ornithology, and ie unique in point of thoroughnese and modo of execution. It is really hut an instalment of a general bibliography of the ornithology of the world upon which the author has long heen engaged, and coneists of the "titles and digests of works and papers relating solely to the birds of North Amcrica indiscriminately, collectively or in general," and must prove an invaluable source of assistance to future workers in this field. Indeed, to the general reader it possessee a peculiar intereet as ehowing the rapid progress of tbis hranch of science, from tbe imperfect allusion to our most ahundant and familiar birde in puhlications of the seventeentb century, to the elahorate and comprehensive treatises on tbe subject of tbe present day. The "Birds of the Colorado Valley" being a government puhlication ie not for sale, but can perhaps he obtained througb Congressmen or coneulted iu the public libraries. It will please all who have a taste for hird studies.

Sinking Rivers.—All of the principal and many of tbe smaller streams in Nevada have no visihle outlet. The larger rivere all terminate in lakes of very considerable area, respectively. The most singular tbing is that tbe water supply in these lakes is at all times the same. The spring freshets, filling tbe rivers from bank to hank work no perceptible change in these great reservoirs. Wbat becomes of all this water is the mystery. It bas been the generally accepted theory that there exists a suhterranean connection hetween the Nevada "sinks" and the Pacific ocean. But this theory ie now disputed hy a gentleman who bas resided on the sbores of Humholdt lake for years. The *Silver State* bas the following on the subject: A great many persons entertain tbe opinion that there is a suhterranean outlet to tbe sink of the Hnmholdt. One of tbese expressed bis views on tbeeuhject in the presence of Walter Schmidt, who has resided near the sink for several years, and built a quartz mill near the visible outlet of the lake. Schmidt dissented from this opinion, and argued that as tbe sink has a hard, clayey hottom, impervious to water, it would he impossihle for it to soak through underground, and attrihuted the disappearance of tbe river to evaporation. "This," said Mr Scbmidt, "is so great in the summer time that a wooden hucket filled with water in the morning would be empty hy noon, and would fall to pieces hefore night."—*Eureka Sentinel.*

Eastern Money and Western Mines.—Now that there are no more four per cent. Government honds to be hought without paying therefor a round premium, it may be expected that Eastern capital will flow towards this way for investment. There is much idle money in the older communities, and as tbis must soon find employment somewhere, it is reasonahle to suppose that a good sbare of it will be emharked in mining enterprises on tbis coast. As the scare over our new Constitution snbsides, tbe purpose hcfore entertained among Eastern capitalists to hecome largely interested in our mines, grows strong again.

MECHANICAL PROGRESS.

Automatic Machinery.

We give the following for what it is worth. We place very little confidence, however, in the story, notwithstanding the very respectable authority from which it purports to emanate. There is evidently some mistake or deception in the matter. We quote from the London *Warehouseman and Draper's Journal:*

"In our issue of the 15th ultimo we were enabled to give particulars respecting some newly invented machinery now in operation at the Oak mills, near Low Moor, in the immediate vicinity of Bradford. The most important part of the announcement was that the machinery had been constructed to run all night without attendance or supervision, and was actually doing so, producing the whole time, and with unfailing regularity, a variety of articles for which the mills are so well known. The statement was very naturally regarded by many persons as a hoax. If correct, it would bring about, they said, a complete revolution in the art of manufacturing, but it could not possibly be true, and there was no use in discussing the matter. We are now able to hear personal testimony to the accuracy of the announcement. We have visited the Oak mills by night, in company with Mr. Binns and a friend. The building itself was in darkness, but we could hear the rumble of machinery as we approached. The door was unlocked, and a couple of candles were lighted. By the dim light we saw the machines all at work, and passing from one to another we noted also what they were producing. There was no possibility of deception and no room for doubt. We were not there to examine the construction of the machinery; it was sufficient to be able to verify the main fact, which is, that when the working hours at the mills are over, the lights are put out, the building is locked up, and the machines are left working all through the night, producing large quantities of beautiful articles in great variety of pattern in silk, cotton and wool. Coming out of the mills and locking the doors behind us, we next visited the engine-room, which is in an adjoining building, completely cut off from the mills, and communicating with them only by a hole in the wall, through which the driving-wheel passes. The engine and boiler requiring attention throughout the 24 hours, the engineer is relieved by a night attendant, who takes his place at the close of the day."

A Costly Iron Fence.—Probably the finest iron fence on this coast has recently been erected just out of Oakland, in front of the residence of Mr. R. R. Thompson. His grounds have a frontage of 310 feet, along which the owners resolved to put up a fence which would stand for centuries as a bar to trespassage. The architect employed was Mr. C. H. Foster, of Alameda, who employed Messrs. Fraunder & Morck to carry out the plans, which are described by the Oakland *Times*, as follows: A deep trench was dug for the foundation, and 23,000 bricks were used in preparing for the iron coping. The posts are of iron, securely anchored deep in the ground and held in the wall by a heavy iron collar. They are over seven feet in height, and ample spaces are left for a free circulation of air. The pickets are heavy bars of wrought-iron, seven-eighths of an inch square, surmounted by an ornamental cast-iron point. The longest pickets are four feet and ten inches, held in place by three heavy wrought-iron stringers, and the alternate pickets are three feet and two inches in length, held in place by the two lower stringers. The posts of the great gate, in the center, are 22 feet high, including the gas lamps that ornament their tops. These posts are held together by an arch of wrought-iron, consisting of scroll and ornamental work, every piece hammered out on the anvil of Fraunder & Morck. The gate posts, cast in pieces and fastened together in the most substantial manner, are hollow, and a large rose bush, trained through the openings on each side, passes up the post and along the arch to the center. Forty thousand pounds of iron were used in building this fence, the total cost of which will be about $6,000. It will be finished in imitation of bronze. It is a great credit to the Oakland establishment that produced this splendid piece of work.

Interesting Figures.—Some interesting figures in regard to the life of rolling stock and superstructures have been compiled by the Illinois railroad commissioners, from the returns of 26 roads reporting on the subject. They show the following general average of duration: Locomotives, 15½ years; passenger cars, 15¾ years; stock cars, 10 years; freight cars, 11½ years; iron rails, 7 years; steel rails, 14 years; oak ties, 7 years; pine ties, 4⅝ years; cedar ties, 5½ years; truss bridges, 9½ years; trestle bridges, 8 years; pile bridges, 9 years; joints and fastenings, 7 years; and fencing, 8½ years. The Toledo, Peoria & Warsaw road gives the life of locomotives at 8 years, and of passenger cars at 15, while the Michigan Central gives locomotives 24, and passenger cars 20 years of life. Only one other road puts the life of passenger cars at 20 years. The lowest reported life rate of passenger cars is 8 years. The shortest life of iron rails is 3 years; the longest 12. Four roads give 10 years. Only four roads report the life of steel rails, and they give it as 9, 12, 15 and 20 years respectively. The reported life of truss bridges ranges from 5 to 20 years; of trestle, from 5½ to 10; of pile from 6 to 12; of fencing from 5 to 10.

The Keely Motor on a New Tack.

Mr. Keely has made, what he calls, another advance in his "motor." His former generator, which cost him some $60,000, has been thrown aside as worthless, and replaced with a new and entirely different machine, which he calls a "vibratory engine." He has also re-christened his new "cold vapor," as he has heretofore called the substance which he proposes as a substitute for steam, and now calls it an "intermolecular etheric substance," a name less open to scientific objection.

He still, however, claims to obtain a pressure of 20,000 pounds to the square inch, by simply using a little water, moving a short lever and opening a four-way valve, by which his "intermolecular etheric substance" is isolated and confined; but he does not tell us upon what principle this etherial substance, which, in its normal condition, is so attenuated as to pervade all nature, can be so confined as not to pass readily through the pores of iron, which admit quite a free passage to many of the advancing gases, and through which even water will pass under the pressure sometimes given to the hydraulic jack.

In Mr. Keely's new departure, however, he has abandoned the idea of "pressure" and employs, as already stated, a "vibratory" engine, which is described as follows:

Its main part consists of a steel disk, about 30 inches in diameter, having a shaft passing through it. The disk is intended to revolve in a vertical plane. Projecting from the disk at right angles to it and near its periphery are a series of 288 steel pins about one-eighth of an inch in diameter and varying in length from about five inches to two and one-half inches, these pins being highly vibratory. The disk is surrounded with a cast-iron casing resting on a cast-iron bed-plate, underneath which are some steel disks that are also highly vibratory. The function of the steel pins is, according to Mr. Keely's explanation, to intensify the vibration of the inter-molecular etheric substance, producing "a rotary or vertical circle of vibration," which circle of vibration runs the engine. By this device Mr. Keely says he has succeeded in harnessing the power of vibration, hitherto, except in music, known only as a destructive power, against which engineers had to guard with the greatest care.

Probably the most wonderful thing Mr. Keely has yet done, or will ever do, is to so completely hoodwink certain capitalists as to continue to draw money from their pockets to carry on his useless and visionary schemes.

The First Steel Bridge in America.—Arrangements have been concluded by Gen. D. D. Smith, chief engineer of the Chicago & Alton railway, for constructing the first all-steel bridge in America. Gen. Smith will be remembered by his connection with the United States Government Board for Testing the Strength of Iron and Steel, experiments which were carried on by him several years ago. His researches have at last brought him to the conclusion that steel bridges can be built cheaper than iron, and be equal in durability. The bridge will be erected over the Missouri river on the Chicago & Alton railway. It will be of five spans of 350 feet each. The elevation over high-water mark will not be less than 80 feet, at which hight the light steel rods of the "Howe truss" will look like silver cobwebs, glimmering in the sunshine. For all its frail appearance, the bridge will have a strength reached by but few existing structures in the world. The total amount of steel used in the construction will be about 1,500 tons, equivalent to almost double that quantity of iron.—*American Journal of Industry.*

Different Methods of Working.—A good illustration of the different methods by which mechanical and engineering work is sometimes done may be found in the history of the transportation and setting up in London and Paris respectively, of the two Egyptian obeliske, Cleopatra's Needls and the obslisk of Luxor. In erecting the obelisk of Luxor more than 200 men and a very complicated mass of machinery were required. Only 25 men and very simple apparatus were used in erecting Cleopatra's Needls upon the Thames embankment. The transport and erection of the obslisk of Luxor cost the French government nearly $75,000; while the expenses for the same operations upon Cleopatra's Needle only reached about one-fourth of that amount. This difference is altogether out of proportion to the difference in weight and and dimensions of the two masses. Cleopatra's Needle weighs 186 tons and is 65.5 feet in hight; the obelisk of Luxor weighs 225.9 tons and is 74.9 feet in hight.

An Improved Knitting Machine.—The English correspondent of the *Iron Age* writes in regard to a new American knitting machine, as follows: I heard the other day, of a wonderful American machine which has just been introduced into this country for knitting purposes. It is now at Nottingham, and is said to be of such an amazing kind that the finest weaving machine is a "mere fool to it." Some of the Lancashire manufacturers at Bury and elsewhere are not unlikely to adopt it for hat making, and a variety of other purposes. It has 42 needles—or may have 10,000 if need be—and may be readily run at 160 revolutions per minute. It is the invention of a Scotchman, who has spent 14 years in perfecting it. He offered it first in England, but could not obtain a purchaser. He then went to the United States, where its merits were speedily recognized and appreciated. Having sufficiently protected his machine by patents, he is back again in England, and is said to be about to sell his rights to a wealthy company.

An English Workman on American Nails. An English workman thus testifies in the *English Mechanic* to the good quality of American wares: But I speak of things which I know thoroughly well, when I say that in very many things our manufactures are not fit to be shown in the same street with American ones; and this is not merely in knick-knacks or little ingenuities, as to which it is tolerably evident we have no pretension to enter into any comparison. I only invite anyone who doubts my statement to compare such a rough common matter as "cut nails." Our rubbish, with half of them split up, which tends to turn round in the wood and split it, and with conical heads, look very poor against the straight, clean nails, with well-formed heads, which the Americans used to send out to Australia, and which when I had once seen them, prevented me from ever buying an English nail again as long as I could get the American ones.

Demand for Railroad Iron.—A French writer estimates that 4,000,000 rails are required every year to renew the worn out stock on the railways of the world already in operation, besides what are needed to lay down new roads. The average wear of a rail is 10 years. The rolling mills of the United States have a capacity of nearly 2,000,000 tons, though our consumption of rails, including imports, is not half that amount.

SCIENTIFIC PROGRESS.

A New Blasting Compound.

A new blasting compound, composed of gun cotton and nitrate of baryta, and invented by Mr. J. E. Huetter, is now in extensive use in Germany and England. It is especially recommended for mining purposes, as no smoke nor dangerous gases are generated by its explosion.

Moist gun cotton is passed between a series of rollers, by which it is compressed so as to form hard, moist lumps. In order to obtain it in the form of powder, it is now passed through a mill. The powder is, in conical vats, mixed with water containing a little ammonia and caustic soda, so as to form a thin paste. Through the bottom of the vat a current of air is introduced, keeping the entire mass in constant motion. At the same time the temperature is raised to 236° Fahr. by means of steam passed through the mass. After the lapse of three hours the gun cotton has attained a sufficient degree of purity. It is now well washed with pure water, and is now ready for mixing with the nitrate of baryta. The latter salt has, after protracted trials, been found to be the most suitable of all nitrates for this purpose, as it does not only give rise to a minimum of smoke, but also permits the development of the practically greatest force within the smallest space. The materials are mixed in equal proportions. The gun cotton is previously dried in a centrifugal apparatus, and is then passed through a mill together with the nitrate. The powder obtained is now pressed into cartridges. The cartridge press consists of a horizontal iron plate revolving around a vertical shaft. The plate is two feet in diameter, and into its upper surface are sunk round holes corresponding in size to the cartridges. The holes being filled with the powder, the latter is compressed by pistons fitting closely into the holes. The pistons are provided with short, thin stems extending into the center of the compressed mass, and forming the cavities for taking up the fuse. The cakes are now exposed to a current of hot air until they are hardened sufficiently. They are covered with several layers of thick paper, dipped into melted paraffine to protect them against the effects of moisture, and packed for shipment.—*Chemiker Zeitung.*

A Curious Property of Heat.—Mr. C. J. Henderson has been conducting some experiments lately in Edinburgh with a view of finding out what is the most economical way of heating a public hall, and has decided that the best results are to be obtained by using an accumulator or stove-room, where the heat, generated by any means whatsoever, is collected, and from which it is discharged through one opening about three or four feet square and seven or eight feet from the floor. The experiments unexpectedly exhibited with what instantaneousness and equality heat is transmitted through space independent of the direction in which the entering heated air is moving; four thermometers were placed at the same height on each of the four walls of the hall which was to be heated, and it was found that just as the heated air entered from the stove-room so the mercury in the several thermometers rose, whether they were hung on the same wall in which was the opening to the stove-room, or on the north wall, 50 feet away.—*Scientific American.*

Absorption of Water by Wood.—E. J. Maumene finds that the absorption power varies in different woods, when dried in a vacuum, between 9.37% and 174.86%. The maximum, 174.86%, or seven-fourths of its own weight, is found in chestnut timber. The moisture contained in wood, in its ordinary state, varies between 4.61% and 13.56%. The absorption power varies but little in different samples of the same wood.—*Les Mondes.*

The Velocity of Light.

There are now in progress at the Naval Academy, Annapolis, preparations for a scientific investigation of an interesting character. Ensign A. A. Mitchelsoa, U. S. N., having delivered a lecture upon "Light" before the association of scientists, made in preparation for it a series of investigations that induced him to believe that he could determine more accurately than is now known the velocity with which light travels, the two accepted computations differing about a thousand miles in the distance asserted to be traveled in a second. Under orders from the Navy Department, Mitchelsen has erected the apparatus to determine his theory practically.

The plan is essentially that used by Foucault, with the exception that a lens of great focal length, and a plane mirror, are used instead of a concave one. This arrangement permits the use of a considerable distance, and consequently gives a longer interval of time, which insures greater accuracy. The displacement of the image of a slit is the quantity to be measured, and this in Foucault's experiments was a fraction of a millimeter, and in the velocity of light could not be determined with any greater accuracy than could this displacement, which would be a fraction of one per cent. In the experiments made by Mitchelson the displacement has been increased to over 100 millimeters; hence the error introduced by this measurement would be less than one-thousandth of the whole, or less than 20 miles.

Another, though not an essential feature, is the use of a tuning fork, bearing a mirror on one prong, and kept in motion by a current of electricity, by means of which the speed of the revolving mirror can be ascertained with the same degree of precision. The mirror is put in motion by a blast of air furnished by a small rotary blower, which is driven by a steam engine. By this means a very steady speed is maintained. The entire apparatus is nearly finished, and in a short time observations will be commenced at Annapolis.—*Journal of the Franklin Institute.*

Do Gold Nuggets Grow?—A startling theory has been advanced by Mr. G. Attwood, in a paper read before the Chemical Society of England, which will make experienced California miners shake their heads. Mr. Attwood asks, do gold nuggets grow? and answers by assuming that they do, owing to the accumulation of fresh particles of finely precipitated gold. At Guayaua, Venezuela, a large area of alluvial soil has been found to contain gold, and nuggets up to 25 ounces have been discovered within three feet of the surface. Quite one-half of these nuggets are covered with a dark-brown substance "resembling a silicate of iron." By treating such a nugget with hydrochloric acid and caustic soda, it was found to be diminished considerably in weight. During this dissolving process much gold, in a finely divided state, became attached, and after this treatment the nugget was partly covered with a coating of finely divided gold of dull color.

New Voltaic Battery.—M. A. Heraud uses chlorohydrate of ammonia and calomel. When this circuit is closed the chlorohydrate of ammonia, in the presence of zinc, forms a chloride of zinc with the transference of ammonia and hydrogen to this positive electrode. The hydrogen reduces the calomel, yielding metallic mercury, chlorohydric acid, and consequently chlorohydrate of ammonia. As long as there remains any of the calomel about the positive electrode the chlorohydrate of ammonia will be regenerated. In a battery of nine elements the intensity was 0.73 at the end of 227 days, and 0.50 at the end of 984 days, the primitive intensity being one. When compared to sulphats of copper the mercury gave an intensity of 1.4512 at the beginning, and 1.0749 after six months' use.—*Comptes Rendus.*

An Electric Blowpipe.—M. Jamin remarks that the electric arc which plays between two carbon conductors is a true current. If submitted to the influence of a neighboring current, of a solenoid, or of a magnet, it experiences an action regulated by the laws of Ampere, identical with that experienced by any metallic conductor put in its place, but as its mass is exceedingly trifling its speed is considerable. The author takes advantage of this fact to submit small quantities of matter to an intense heat. By causing the arc to be driven upon lime, magnesia or zirconia, the light is directed downwards and its intensity is increased at least three-fold.—*Comptes Rendus.*

Siliciuret of Iron.—The committee of chemical arts of the French *Societe d'Encouragement pour L'Industrie Nationale* has undertaken the examination of the uses which can be made of this new compound. Prof. Lawrence Smith sent them an ingot weighing about three kilogrammes (6.6 pounds), with a color like platina and a specific gravity of 6.5. It is easily broken by the hammer, does not rust in the air, is not corroded by concentrated nitric acid, and scarcely by any reagents except fluorhydric acid and melted alkalies at a red heat.

Dew.—Mr. George Dines, who has made extensive experiments and observations on the formation of dew, finds that the depth of deposit in England in an evening rarely exceeds a hundredth part of an inch; and that the average annual depth of the dew deposited upon the surface of the earth does not exceed an inch and a half.

Mining Share Market.

If the promises of dealers and tho predictions of operators generally were infallible, we should have had a booming market during tho past week. The earlier portion was marked peculiarly by prophesios of this immediate inflation, but the facts as yot have failed to do more than sustain the confidenco that there is a better market to come—some time. Thero has been, to be suro, a rise in prices and more fluctuation than for some timo past, but the usual signs—the hitherto invariable forerunners of previous heavy turns in the market—havo been entirely wanting, and the activity displayed has really been littlo more than would ariso from the couvalescence of the market from the late election scare. Not that there may not he a heavy deal, and that very soon; indeed, the near approach of the Comstocks to tho "new bonanza" ground, the promised immediate completion of the Sutro tunnel, and the consolidation of stocks in firm, good hands points strongly to such a probability. But, as yet, it remains for this probability to become a reality. Action in the Comstocks has not been confined to any one particular section, but all three have displayed an almost equal amount of life. The Bodies, too, have been largely dealt in, and are noticeahle as not participating in Tuesday's fall. Other outside stocks have discovered streugth, and at present writing there is a steady upward movement in everything.

California Academy of Sciences.

A meeting of this society took place on Monday eveuing last, Dr. Harkness in the chair. Among the donations to the cabinet was an interesting specimen of fungus, which was found attached to the base trunk of the bay laurel. The texture of this fungus is very firm, its material having been used in lieu of cork, and when chemically prepared, forming an excellent material for the manufacture of slow fuse. Also, two specimens white marble, from Colton quarry, San Bernardino county, by J. M. Hutchings; one specimen agate, by Master Doble, Fremont street, San Francisco; gold quartz, Texas Flat mine, Fresno county; silver ore, San Juan mine, Pima county, Arizona; gold quartz and copper ore, Amador county, and gold quartz, Joe Davies mine, Trinity county, California—from R. H. Stretch.

W. N. Lockington read a paper descriptive of the new and rare fishes of tho Pacific coast. This was followed by a discussion on the organs of bearing in fish. A communication was received from Prof. Davidson, reporting that an astronomical party has taken the field with the view of establishing stations for the pursuit of astronomical observations at high altitude. This is elsewhere referred to in this issue of the Press.

A letter was read from Prof. Finck, of Bremen, now in New York and shortly to visit this city en route for the Sonth Seas, and the Academy was nrged by Dr. Stout to tender him a reception, and Messrs. Stout, Behr and Yale were appointed a committee by the chair to meet the gentleman and request bim to give to the Academy an outline of his intended researcbes in the South Seas. Prof. Finck is well-known from his Siberian explorations and now seeks new fields in a milder clime.

The Hope Iron Works.—The Hope Iron Works were projected by Mr. W. W. Hanscom, four years ago, for the carrying on of general machine and foundry business, as well as for special work and machinery. In building these works, they were fitted up with the best tools to be made in the United States, made expressly for Mr. Hanscom, by the celebrated firm of Bement & Son, Philadelphia, and consist of lathes from 7½ fect swing and 30 feet long, to 12 inches swing and 5 feet long, with planers, shaper-drills, slotting machine, bolt cutters, and a complete outfit of small tools, such as boring bars, reamers, drills, cutters, machine cutters, etc. The pattern shop has band and circular saws, lathes, etc., with air chucks, etc. The blacksmith shop has two forges and steam hammer, also of Bement & Son's manufacture, and all blacksmith tools. The foundry has a room 40x100 feet, with five-ton crane, eight-ton cupola core oven, with iron carriage and track leading under crane, full assortment of ladles, clamps, core plates, weights, flasks, etc., also independent blowing engine and Sturtevant blower. The works have ample capacity for 75 men, witb a good assortment of standard patterns, including vertical engines, propeller wheels, steam pumps and borizontal engines, gearing, boiler fronts, etc. This is a rare chance for any parties desiring to engage in the foundry and machine business.

Mining Summary.

The following is mostly condensed from journals published in tbe interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

Drytown—Cor. *Dispatch*, May 17: Dr. Mayou has been trying to negotiate with the Crown Point company, for the working of that property. The present owners only got down on it some 125 or 130 ft, and the ledge is in fine looking formation. The Centennial mine has been stopped for the last two or three weeks, for the lack of funds, their rock being low grade, although looking splendidly. The Webster mine, joining the Potosi on the north, has been jumped by a party of Italians; mostly members of the Centennial company, and they are now sinking a shaft on it. When worked last, some years ago, the prospects were favorable. The Hercules mine is still idle, presumably because the parties interested below failed to send up tho cash. The prospects are not as favorable as they might be. The general belief is that L. Meiss, whose claim lies immediately east of them, has got the main ledge. Business has not yet been resumed at the Pennsylvania mine. The superintendent has been below for some time back, but probably they will start up again in a short time, as the property is too valuable, and the prospect too good to let it remain idle long.

Sutter Creek Notes.—The Mahoney is still sinking a perpendicular shaft to strike the main ledge at the depth of 1,000 ft. The company are expecting new machinery from the East at an early day, to be used in this sinking and for the future. The Con. Amador Co. havo advertised for bids to sink 100 ft on the new shaft of that mine. This company are now crushing the old "gouge dirt" taken from the mine. They crush about 160 tons per day which pays about $1 50 per ton.

BUTTE.

The Vermillion Mine.—*Mercury*, May 16: This property is located at Forbestown, commencing in tho edge of the settlement, and extending up Forbestown ravino to the line between Yuba and Butte counties. It contains about 100 acres of land, and was purchased by Messrs. Frank and Wm. Oerling, in the spring of '78. A company of Stockton capitalists have recently taken hold of the property and put in pumping machinery and pipe, and obtained a supply of water from the Gaskell ditch, 100 ft below the mine. The water is forced through 2,000 ft of pipe, up an elevation of 350 ft into a reservoir, from whence it flows to the mine under a pressure of 200 ft. These improvements have necessitated an outlay of $15,000.

Improvements.—Some weeks since, ono of the flumes belonging to the Hewitt claim tumbled to pieces, and Messrs. Brock & Taber were awarded a contract to make 750 ft of 30-inch pipo to take its place. Workmen are now engaged in placing the pipe in position. In its manufacture, 22,800 pounds of No. 14 iron and 500 pounds of riveta were used. The firm was only five days in filling the order.

CALAVERAS.

Collier Mine.—*Citizen*, May 17: This mine, owned by Mr. Collier and situated near Murphys, is now being worked and is turning out remarkably rich rock. The rock is crushed just as it is taken from the mine, without being assorted, tbe poorest of which more than pay expenses. As the mine is developed it shows a number one lead, and continues to improve in richness. A five-stamp mill has been erected on tbe mine, and is kept constantly running.

Mill Refitted.—Smith's mill, near Murphys, has recently been refitted and put in running order, and is now being run in full blast. The mill is composed of six stamps and is one of the best in the county.

Eho Hydraulic Claim.—This claim is situated in Eho mining district, between Murphys and the Stanislaus river. Curtis & Co. have been at work with the hydraulic and have uncovered a large area of rich gravel.

Bumble Bee Claim.—This claim, situated near Murphys, is owned by Wade and Freeman. Between six and seven tons are now on the dump, which will yield, on an average, about $15 per ton. They have a cut run into the hill 50 ft long and 12 ft in depth. At present they are engaged in sinking a shaft in the cut which covers the lead, the width of which, on an average, is one ft.

Boston Hydraulic Claim.—This claim is situated on Whisky hill about half a mile from Jenny Lind. E. F. Kendell, Superintendent of the mine, has 14 men employed besides several Chinamen. This claim is run by hydraulicing, and a large amount of ground is washed in a short time. The claim is paying well.

Buckhorn Claim.—The owners of this claim, situated near Murphys, on the grade leading to Altavills, have erected a one-stamp mill and two arastras, with which to crush the ore taken from their mine. The mine is owned by Haselton & Co., and from present appearances they have got a good claim.

Quartz Ledge Discovered.—*Chronicle*, May 17: Herbert and Warren, of Sandy Gulch, have lately discovered a very promising quartz vein near the South Fork of the Mokelumne, opposito Holmes' mill. The lead is narrow, but rich, good judges estimating that it will mill $8 per cargo. But little prospecting has been done yet, the proprietors not having completed preparations for active operations. A shaft has been commenced, however, and work will be urged forward shortly.

INYO.

Modock.—*Independent*, May 10: The tunnel on the 1000 level has been run in 1,585 ft. Shaft from 300 level sunk 19 ft; total depth to date, 401 ft. Upraise been raised 12 ft, giving total hight of raise 124 ft. Distance between top of raise and bottom of shaft, 38 ft. Fall of tunnel has broken into a clay gouge, carrying good indications for ore. Face and sides of tunnel are about four ft in this clay and ledge matter. Have had good ground for the past week. Could have no better indications for ore ground than now in face of tunnel. There should be very little ground between sbaft and upraise at the end of this week, and nothing can prevent good progress being made.

Darwin Items.—Ores are still coming in from Wildrose, Minnietta, and the Ygnacio mines. After this run is concluded, Superintendent Williams will continue on purchasing ores on the same favorable terms as heretofore. The Now Coso furnace was started up on May 1st, tho blast being turned on at 10 a. m. The furnace has been running steadily since the start. Messrs. Birchett & Parker, who have the Snow Canyon five-stamp mill leased for a season, have brought in between $4,000 and $5,000 in gold and silvor bullion, being the clean-up from a two weeks' run. A large proportion of the ores first worked by Messrs. Birchett & Parker came from the St. George, represented by Mr. Mason and the old Virginia property of Messrs. Grove & Mitchell. Mr. Mason reports the St. George as being down over 100 ft, and that ores taken from that depth for the preseut run, averaged $100 per ton in gold.

MONO.

Tioga.—*Standard*, May 17: Outside of Standard, Bulwer, and Bodie, no mining enterprise in the district possesses such a substantial showing for a long-lived, self-sustaining institution as tbe Tioga. Excellent machinery, good depth and all work of exploration in first-class shape. The ledge in west crosscut, 320 level, has not shown signs of failing at any point, and is now drifted on nearly 100 ft in length. The width of the ledge is nearly four ft, and grade of ore a profitable milling proposition. Chief interest is still centered on tbe corresponding crosscut, 520 level, now nearly 200 ft from shaft, in ground very favorable botb for rapid work and carrying ledges.

Mono.—On the 400 level, the joint crosscut on the Bodie line is in from the lateral drift 160 ft oast and 112 ft west. In the latter a fine vein wae cut during the past week, containing considerable ore. The east crosscut from the shaft, same level, is in 115 ft. The Mono vein was cut about 90 ft from the shaft, and was found considerably broken. Drifts are being run both north and south on this vein from this crosscut. The drift is altogether about 60 ft in length. A south drift is being run from the crosscut on the boundary line to connect with this drift.

Standard Con.—The north drift from the main shaft has been advanced 14 ft; total length, 182 ft. The ledge is four and a half ft wide, of very good ore. An upraise on this ledge is now 52 ft above the drift, where it shows four and a half ft of fine ore. The east crosscut from the south drift is in 72 ft; progress, 11 ft. The rock in the face is hard. The winze on the Cook ledge has reached a depth of 25 ft. The ledge is two ft wide, and looks well. The west crosscut, 700 level, is in 110 ft, and is at present in very hard ground. The south drift on the Oildea ledge is in 149 ft. The ledge is two and a half ft wide, of fair ore. The stopes are looking well. The bullion shipments for the fiscal month of April amounted to $102,002.89.

Syndicate.—The south drift has, for the past 25 ft, shown an improvement in the shape of a vein about eight inches wide, accompanied with a flow of water amounting to about four inches. The assays from this vein are very flattering. The work of sinking on the Osceola vein from the old tunnel continues, as well as raising from the new tunnel to connect with the winze. About 100 ft more will have to be made before the connection is completed. Are breasting with one sidft on the Osceola ledge, the ore being put in the chutes preparatory to taking out through the lower tunnel when the connection is completed. The ore is turning out satisfactorily as to quality. The mill is running steadily on custom ore.

Con. Pacific.—The winze on ledge No. 1, where tapped by crosscut from bottom of winze No. 2, is down six ft. The ledge is widened from 20 inches in thickness to nearly 30 inches, and has more of an eastern dip. The ore is of a good milling grade, is decomposed and separates easily from tho walls, which are well defined. The main shaft is down over 230 ft. A ledge of considerable strength, and assaying gold, has come into the shaft with an eastern dip. Tho ground has generally hardened and work is slower. It is expected to crosscut at 250 ft, which depth will be attained by tbe 25th inst.

Blackhawk.—The west crosscut, on the 220 level, is in 94 ft. The face of the crosscut shows a favorable change. The winze on tho same level is down 42 ft. The vein in the bottom of the winze is fully as wide as where started—about four ft—and of the same character of ore. The east crosscut, 320 level, is in 38 ft, showing frequent seams of quartz. On tho samo level, drifts are being run north and south on the first vein cut in the west crosscut. The south drift is in 31 ft, and the north 28 ft. An improvement is shown in both directions upon tho point where first cut.

Bodie.—The east crosscut from tho old shaft is in a total distance of 266 ft. The east crosscut, second level, is in 145 ft; the west crosscut, second level, 79 ft. On the same level a crosscut has been started east from the Gildea, which has been run 12 ft. The west crosscut, third level, is in 35 ft. The drift nortb on the vein, same level, is in 124 ft. The mill is running steadily on Bulwer ore. Arrangements have been made for increasing the capacity of the mill by adding two pans and a settler.

NEVADA.

Derbec Mine.—*Transcript*, May 18: Everything is running smoothly at the Derbec mino, the employees having resumed their places at the old wages, viz., $3 per day. The recent reduction to $2.50, which caused all of the miners to quit work, was the result of a misapprehension on the part of the Superintendent. It is reported that it was far from the intention of the board to reduce the wages of skilled labor, and that upon learning such an effort was being made, they immediately took steps to prevent it.

Pleasant Valley Notes.—The gravel mines in Pleasant valley are beginning to make their final clean-up, the supply of water being nearly exhausted. At the Badger Flat claim four men have been busily at work since December last, and they are now cleaning up for tho first time, with good prospects. Hamilton & Co. are prospecting on Beckman hill, near Novey's ranch. There are four or fivo men working, and they are now in gravel and hard cement. The owners of the property appear to be satisfied with the outlook.

Ditch Improvements.—The Excelsior ditch company contemplates making some important improvements along the line of their property at an early date. The head of the ditch is at the moutb of Rock creek, two and a half miles above Hoyt's old crossing. At the mouth of Rush creek some heavy masonry work will have to be done, and all along the line to Smartsville the ditches and flumes will be re-constructed to a great extent.

Jottings.—*Foothill Tidings*, May 17: In the Scadden Flat mine the ledge is strong, being from 18 inches to 2 ft in width. Recently there has been some very rich rock taken out by tributers. There are between 50 and 00 men working about the mine. The new shaft of the Rocky Bar is 120 ft perpendicular, and is extended 70 ft below that on the incline. The ledge is not large but of excellent quality, paying $35 per load. In the Centennial the ledgo is showing an average width of six inches—a good size for this mine. The rock taken from this mine has been almost uniformly rich, and from a clean-up of 43 loads, at Smitb's Orleans mill, $4,800 was obtained, without including the sulphurets, which will go several hundreds more. Washington is timbering the new shaft, and building a new 40-ft water wheel to run the pump. Regular mining work to be resumed when those improvements are finished. The Hathaway gravel claim, situated on Scotchman's creek, near Washington, is prospering. They have about 4,000 inches of water, with a fall of 350 ft. Eight white men are regularly employed, and 30 Chinamen are working by contract. At King's Hill, work is progressing as usual, and the mine reported looking well. No recent clean-up has been made. The last crushing was a very profitahle one to the lessees. The ledge has lately opened up splendidly on the south drift of the 250 level. Of late the ledge in the New York Hill has increased in size, more men have been put to work, and everything is said to look quite favorable. Work on the Cold Spring gravel mine, northeast of Nevada City, progresses as usual. The tunnel is being pushed ahead energetically. The shaft of the Knight of Malta mine is to be sunk 100 ft deeper, or nearly 200 ft in all. Tho work was commenced a week ago, and good progress is being made.

PLACER.

Gold Run Items.—*Argus*, May 17: The miners at this placo are all busily at work, with a very fair prospect of at least an averaging good yield. The Big Bonanza has had two clean-ups, and it is reported that the company will be able to net $16,000 per month. The Towle Bros., J. L. Gould and Col. J. F. Moody are the principal owners. Twenty-five to 30 men are employed day and night, and about $1,500 inches of water used. The Cedar claim, adjoining the Big Bonanza, has had three clean-ups, with satisfactory results. The amount is not named. About 15 men aro constantly employed day and night.

Dutch Flat.—The Glen mine, owned by Andrew Larson, is one of tho best in the county, and has been thoroughly prospected by Mr. Larson, who is at present pushing forward the work on his tunnel, which be has already run about 600 ft; he has also a good track laid and an easy grade. After running about 50 ft more Mr. Larson expects to strike rich paying gravel.

PLUMAS.

Hungarian Gulch.—*National*, May 10: Some time last fall a company consisting of Messrs. Houck, Sterrit, Brown & Oansner, commenced sinking a shaft in the mouth of Hungarian ravine. They have got the shaft to bedrock, at a depth of 42 ft, and have drifted from it about 15 ft. Three or four days ago they struck a "lead," and from a bucket of gravel took out $15 in coarse gold. They are well fitted up to work, a 10-ft overshot wheel doing the pumping, and will soon be rigged to hoist the dirt. The old gulch was worked up from a point about 500 ft below tho preseut shaft, and paid enormously.

Plumas National.—This mine is showing up well, and has every indication to prove it a permanent and valuable property. The workmen in the lower tunnel reached the ledge about a week ago, after running 840 ft, the vein matter coming in strong and showing a ledge averaging four and a half ft in width, prospecting richly in free gold, and showing a superior quality of quartz. The ore is free milling, and the sulphurets carry considerable gold, and are readily worked by the ordinary mill process. The distance from lower level to No 1 tunnel, with the incline, is over 300 ft. A shaft was commenced in the tunnel before the ledge was reached below, and has made considerable progress, following the wall down, and showing the ore body continuous and coming in strong and well defined, the ledge in places showing a width of five and six ft. This mine has one of the longest bodies of pay ore of any mine in the county, being over 400 ft in length, and at least six years' run of oro will be shown by these developments. The mill, of 30 stamps, is one of the finest in the State, having all the modern improvements.

Gold Stripe Mine.—The Gold Stripe is another of the prominent mining industries of this section. Though having been worked only about two years and a half, this mine has produced a large amount of bullion, and has also made very extensive improvements. It is worked by three tunnels, the lowest being on a level with the mill, with which it is connected by a fine and substantial tramway. The lower tunnel has been run about 1,800 ft, where it struck the ledge. The present work is being conducted to breast out sufficiently to start a series of stopes that will soon be able to supply the mill with ore. The mine has also a large resource of ore in the upper works.

Green Mountain.—This is another of the large working mines of this section, and is promising well. It has produced over $500,000 since it was first opened. The facilities for working and cheapness of production are unsurpassed by any mine in this State. A fine 32-stamp mill is connected with tunnel No. 3, and is run by water power. The water is brought from the immense reservoir in Round valley, through eight miles of ditch.

SIERRA.

Rainbow.—Downieville *Messenger*, May 10: The old Rainbow quartz ledge, at Chips' Flat, is to be opened and prospected by men of ample means and good business capacity. Last December, Wm. A. Hanley, an old resident of Alleghany, organized and incorporated a company, which is now proceeding in a systematic manner to re-open this once famous deposit, which once, within the space of 50 by 200 ft, yielded nearly $300,000, in gold. No work has been done on the property since 1864, for the reason that the persons owning it were not financially able to put on the necessary machinery to keep the works clear from water. During the intervening time, however, the hill has been drained by lower tunnels, and although the owners expect to encounter considerable water, the task of handling it will not be so difficult as it would have been 15 years ago. The following gentlemen aro officers of the company: Trustees, S. C. Farnum, (President) N. C. Walton, (Secretary) J. O. Groves, W. A. Roberts and W. A. Hanley.

Excitement.—There is great excitement in Sierra City and vicinity over the recent rich gravel discovery in the ridge southeast of that place. From one wheelbarrow load of gravel $8 was obtained. The whole country has been located, if reports be true. An immensely rich gravel deposit underlies this ridge for many miles.

TUOLUMNE.

Riverside Mine.—*Independent*, May 17: This mine is looking up, as some now and encouraging features have very recently been developed, which is expected, from the present outlook, will provide as much ore above the old levels as has been extracted heretofore. A parallel vein has been discovered a few ft from the one which is being worked at the present time, and which has proved a good milling vein. In the event that the newly discovered vein is of as high-grade ore, it will place tbe Riverside mine in the front rank of quartz mines in tho county, considering the facilities the company have at command for working high-grade ores. The work of running the lower level, to strike tho old vein at the greatest draining depth, is being rapidly pushed forward with the aid of the Burleigh drills.

Miscellaneous.—The Mount Jefferson company are still digging away, but have not struck anything yet. There is a new mining enterprise started, which far more than makes up for any failure on the part of the former. The mine is located in Dick Barnes' field, in the lower part of the town of Groveland, about 50 yards from the main street, and is at present owned by three enterprising young men from San Francisco. They have recently crushed about 12 tons of tho first rock taken out, in the Mount Jefferson mill, and it turned out far above their expectations; yet they have since struck it richer than ever. They have worked it, so far, about four or five ft in width, but have no wall on either side. Surface indications show the ledge to be about 18 ft in width.

NEVADA.

WASHOE DISTRICT.

Sierra Nevada.—Gold Hill *News*, May 21: The bottom of the incline was yesterday within 10 ft of the top of the 2400 level. The bottom is in a very fine formation of quartz, containing streaks of rich ore. Its dip is not so perpendicular as that of the ore body, and consequently it has been carried to the east of the ledge proper. On the 2200 level the stopes have been opened out from the north crosscut, under the incline, to the south crosscut, a distance of 68 ft, and 12 ft wide. The new ore house is not quite ready for use.

Union Con.—The main south drift, 2300 level (2200 level of the Sierra Nevada), is in 148 ft, and is encountering a fine vein formation, containing promising stringers of quartz. It is being run entirely outside the vein. The main north drift, 2000 level, continues in hard, blasting porphyry, and has its face 300 ft from the south line.

Belcher.—The main incline has reached a sufficient depth below the 2700 level for a chute for the station, and it is being put in. The soutb drift, 2500 level, is now 447 ft in length, and is heing pushed along the west side of the vein. The new crosscut on this level, 300 ft south of the incline, has not yot reached the ledge.

Con. Imperial.—The joint Alpha winze is now down 250 ft on the slope below the 2400 level. To the length of the north drift, 2600 level, 40 ft per week are being added, through quartz and porphyry; total length, 278 ft.

Ophir.—The incline is 60 ft, on the slopo, below the 2300 station, and is to be continued on down to the 2400 level. It is still in a very fine and promising formation of low-grade quartz, which gives indications of making into something better when prospected further. On the 2000 level the south sill floor has followed the vein till it has widened from one and one-half ft to over five ft of good milling ore.

California.—The stopes yielded tho past week an average of 157 tons per day, which has now been increased. Thirty ft per week are being added to the length of the joint Con. Virginia west drift, 850 level, and its face is now 185 ft from tho shaft, in hard porphyry.

Gould & Curry.—Thirty ft per week are being added to the length of the joint east crosscut, 1700 level, and its face is now 914 ft from the lateral drift in hard, blasting ground. The work of cleaning out and retimbering the south lateral drift, 1700 level, to connect with the Savage winze has been receiving required attention.

North Bonanza and Flowery.—One crosscut is on the 200 level and at a point 200 ft north of the sbaft. Another will be started on the same level, 575 ft further north. The third will be on tho 300 level.

Justice.—Streaks and bunches of ore continue to be found in tho crosscut 1150 level, the drift 1300 level along the west wall of the vein, the lateral drift between crosscut five and six same level, and in crosscut No. 1, 1550 level.

Alta.—The station, 1750 level, of the joint winze has been completed, and drifts started botb north and south as bases for crosscuts.

North Con. Virginia.—Tbe shaft is to be adapted to the use of skeets, which will contain about three tons of rock each, and as soon as this work is completed, sinking will receive a new impetus.

Best & Belcher.—The joint east crosscut, 1700 level, is being driven toward the perpendicular of the new joint east shaft at the rate of 30 ft per week; total length from the lateral drift, 914 ft, its face in porphyry.

Practical Divisibility of the Electric Light.—No. 2.

A paper, by E. J. Molera and J. C. Cebrian, read before the California Academy of Sciences, April 21st, 1879.

Comparison with Gas Lighting.

Comparing now our system with gas lightiug, we must observe that its use will pressnt no difficulties to the consumer; the motions of the prisms and the secondary lenses will be as easy as ths turning of a gas-key; no matches will he needed; no fear that a hurner was carelessly left open; and no machinery required for that purpose ahout any building. Our system must certainly have all the advantages of tbe electric light upon gaslight, already granted and mentioned before. The only one in dispute was ahout the cost, which our system lowers to an unprecedented degree.

To prove that it is so, we will examine: 1st. The outlay needed to put up a system of lighting; 2d. The running expenses of the enterprise; and 3d; The waste or loss of the system.

1st.—Capital Needed.

The pipes used in our system are uot subject to any especial pressure, may he of any material, and need no gas-tight joints; therefore their cost when laid must he smaller than that of gas pipes. The price of the prisms or reflectors will certainly cost less than the lahor of making tight joints.

As for the works or machinery to produce electric light, their cost is excsedingly below that required for gas works, where very large spaces are uecded, and costly, huge buildings and machinery required.

One important item is the outlay made by the consumers in order to receive the light in their huildings. Instead of the costly net of gas pipes made gas tight, our system requires simply wooden or tin hoxes; instead of the expensive gas hurners, brackets, chandcliers, etc., we ueed only a set of prisms and lens, of a low price, that will never wear out, and nsver need repairs on account of leakage.* The advantages of our system in this respect are self-evident.

2d.—Running Expenses.

As for the running expeuses, we will remark that the capacity of the largest dynamo-electric machines in operation has attained the rate of 6,000 candles per horse power spent. It has also heen noticed in the different patterns of dynamo-electric machines made, that when the light-giving power increases three times or over, the horse power required only increases twice. It is therefore likely that a machine of a 100-horse power will have a capacity of over 15,000 caudles per horse power. Such and still more advantageous machines will be used in our system.

When electric light is produced at the rate of 6,000 candles per horse power, its mere production costs ahout one-twentieth the cost of gas light. When produced at a rate twice as large, its cost must he less than one-fortieth the cost of gas; because the increase in the production of eleotric light does not requirs a proportional increass in lahor or wages. The same numher of attendants will take care of an electric lamp and a chamher of light giving forth 1,000,000 or 2,000,000 candles; and a 200-horse power steam engins does not require twice the numher of attendants than an engine of 100-horse power. Whereas, in gas making, as the gas produced is proportional to ths uumher of retorts in operation, an increase in the production of gas must require a proportional increase in labor or wages.

3d.—Waste.

The wastes of gas making are many, but we will only mention those occurring from the gas holder to the gas hurners. The waste or leakages through the street pipes has heen computed at from 5% to 20%—we will put it at only 10%. The leakages occurring in the gas pipes and fixtures of huildings are from 20% to 40%—let us estimate them at only 20%. The waste on account of defective gas hurners is the most import—it reaches sometimes to 86% of the gas consumed; in Loudon, where great care is exercised in that respect, it has beeu computed hy gas engineers that fully 25% is lost on that account—we will put the average at only 40%. The total of these wastes amounts to over 56% of the gas manufactured. Whereas in our system ths wastes are only 8% for each reflection, and the total can nsver sxceed in practice 50% —less than thoss of gas distrihution.

The facts therefore ahout our system are:

1st. The outlay of consumers for lighting fixtures is smaller for our system than for the gas system.

2d. The capital invested for lighting works in our system is smaller than that required for gas works.

3d. The production of electric light hy our system will he a very small fraction of the cost of producing gaslight.

4th. The loss or waste of distributing light by our system will he smaller than that occurring in the distrihution of gas.

The legitimate consequence, therefore, is that our optical system affords the means of producing and distrihuting electric light in a city, at a mere fraction of the actual price of gaslight.

In conclusion, it will be readily seen that our system can he adapted to all purposes of lighting. It may as well furnish slectric light to a *whole city* from an original station, as to a *single building*, or set of huildings.

It can be extended in a most fitting manuer to the lighting of *mines*, without fear of explosions, without increasing the temperature or contaminating the air; and the light can always he easily shifted to the precise place where ths work is heing done.

In *ships* the use of our system will he invaluable, as it allows not only to have powerful mast lights, hut on account of the minute distrihution of light, every dspartment in the ship may he lighted, without fear of conflagration.

For all kinds of industries and commercial places, where danger of fire is to he apprehended, such as *warehouses, storerooms, powder works* and *magazines, chemical factories*, and the like, our system is *the only* one that can hs used, as it allows to have all the light needed, without the possibility of starting any fire.

Our system will also allow to use light in places where formerly it was unthought of, as for instance, in *railroad tunnels*.

Finally, for all large institutions, like colleges, libraries, hospitals and asylums, factories, barracks, prisons and other puhlic estahlishments, our system, besides totally preventing fires, has the grsat advantage that ths light can never he meddled with hy the inmates of the institution, hut it is under the direct control of only one supsrvising officer.

[A paper by E. J. Molera and J. C. Cebrian, read before the California Academy of Sciences, May 5th, 1879.]

In the following paper will be found some additional data in support of the statements made in our previous communication upon our new system for the practical divisihility of the electric light.

I. Number of Candles Obtained per Horse-Power.

Mr. H. Fontains, a well-known scientist, and a recognized authority in matters pertaining to electricity, declared previous to 1878 that he has several times ohtained electric light at the rate of 1,900 candles per horss power.*

Mr. Tresca, of the French Institute, rsported to the Paris Academy of Sciences his expsriments made in 1875, when a Gramme machine of ahout 18,000-candls power rendered 241 carcel burners (2,270 candles) per horse power.*

In ths experiments mads in 1876-77 at the South Foreland lighthouse by Prof. Tyndall and hy Mr. J. N. Douglass, the Secrstary Engineer of the Trinity House Board, they ohtained 1,291 candles per horse power. † In 1877 said Mr. Douglass saw at Paris a small Gramme machine giving 3,000 caudles psr horse power, and he adds that the factory had just sold a larger one giving 3,839 candles per horse power.‡

In August, 1877, Mr. J. N. Shoolbred, member Institute C. E., stated at a lecture that the Gramme machines could give 3,000 candles per horss power.§

In the *Scientific American Supplement* of March 9th, 1878, it is said that the electric light was tried in Paris at the *Palais de l'Industrie*, where a space of 12,000 square meters was illuminated hy two electric lustsrs of six lamps each; that two steam engines of 25-horse power each were used, and the light was equivalent to ahout 300,000 candles, which gives about 6,000 candles per horse power.

We will now remark the fact, that ths larger the amount of electricity produced by a dynamo-electric machine, ths larger is its light-giving capacity per horse powsr spent. This is in accordance with that electrical law msntioned in our previous communication, and quoted among others hy Wm H. Preecs, of London, ‖ and by Prof. John Ls Conte, of California.** The law is: that when an electrical current is divided into suh-currents, the light-giving power of each suh-current is less than inversely proportional to the square of the numhcr of currents. It is then natural that when several currents are added together, ths result will he larger than the sum of the separate currsnts, as was practically shown hy the experiment made hy Prof. Tyndall at ths South Foreland lighthouse.††

He had two small Siemens machines of a power of 4,446 candles the one and of 6,563 the other, making in all 11,009 candles; yet, whsn they were coupled so as to feed one single lamp, the light produced was 13,179 candles, or 19.7% over the former figure, with the same expenditure of power; or else, they could have produced the same amount of light with less expenditure of horse power.

It has also heen found that whenever tbe power spent in a machine is increased, the light produced increasss in a grsater proportion than the power. And finally, if instead of adding or coupling together two separats currents, we produce a single current in a single machine with a power equal to the sum of the powers spent in the two former currents, ths result is still greater than 20% over the sum of said two currents, as will he seen in tbe following table:

Name of Machine.	Maximum capacity in Candles.	No. of Caudles Fed.	Horse Power Required.	No. of candles per Horse power.
Oramme..	4,000	1	2	2,000
	6,000	1	2½	2,400
	15,000	1	5	3,000
	25,000	1	8	3,125
	36,000	1	10	3,600
	50,000	1	13	3,846
Brush.....	4,000	1 or 2	3½	1,143
	12,000	4, or 5, or 6	6½	1,846
	35,000	10 to 18	13	2,691

The smaller duty, or production per horse power, of the Brush machines, is because they are mads to feed several lamps, whereas the Gramme machines feed one single lamp; so that the Brush machines may he considered as a combination of two or more machines of ahout 2,000 candles each, huilt so as to combins together two or more of them in one; thus, the 12,000 candle machine acts as a combination of six machines of 2,000 candles or less each, which may work independently or in combination of two in one. The difference lays in this: that six separate 2,000 candle machines would require a power of 12 horses, and hy their combination in one nachine, the required power is reduced to 6½ horses. All of which corrohorates the ahove stated fact, and clearly proves that if, at present, the duty of dynamo-electric machines is from 2,000 to 6,000 candles per horse power, with expenditurss varying from 2 to 25 horse power, when we have a machine huilt so as to he run hy 100 or 500 horse power, its duty will certainly increase in a large proportion.

Such machines have not been built, because there has heen no demand for them. A powerful focus of light has no practical application hut for lighthouse purposes; and even in that case, the intensity is limitsd; first, on account of the geographical range, further than which no light can hs seen; and second, because in thick weather a large increase in intensity does not incrsase the optical range but in very few feet. In fact, the only serious objection made to electric light, has heen its too great inteusity, as heing inadequate to the general purposes of lighting. For instance, four lamps of 2,000 candles each, making in all 8,000 candles, and heing properly distributed, will give for a large space a more efficient illumination than a single lamp of 12,000 candles. Thus, a check has been put to the makers of dynamo-electric machines; and the extent of the practical capahilities of such machines has remained necessarily unknown. But as soon as the economical divisibility of the electric light be proved as a fact, larger machines will he built which will take advantage of the ahove-mentioued fact or law, and will causs the further cheapening of the electric light.

Another fact that proves the correctness of the ahove theory, which we havs seen coincides so well with the practical results and experiments of the above-mentioned scientists, is the following results, obtained by Prof. J. W. Drapsr, of New York, who in his researches ou radiant heat found that the light of ignited platinum at 2,590° was more than 36 times as brilliant as when the temperature was only 1,900°.*

Now the tempsrature produced by mechanical means is directly proportional to the work, yet the light corresponding to the increase of work or heat is a very rapidly progressing proportion.

II.—Cost of Electric Light.

Mr. R. Briggs, C. E., of Philadelphia, has calculated tlie theoretical relation of the values of gaslight and electric light, taking as hasis the very low figure of the expsriments of the Franklin Institute; and computing the heat-unity ahsorhed hy a standard candle produced hy coal gas and hy electricity, he finds:

$$\frac{\text{Heat units consumed by gaslight}}{\text{Heat units consumed by electric light}} = \frac{100}{1},$$

But considering that in those experiments only one-third of the horse power was spent in the light, and the other two-thirds wsre necessarily lost, the ahove relation is reduced to 34÷1.† We must remark, however, that the Franklin Institute experiments, showing 380 candles per horse powsr, must have heen made with inferior kinds of dynamo-electric machines, as other competent experts of different countries find a duty per horss power over five times greater; in which case the above relations would be more favorahle still to the electric light; and even President H. Morton, who is not an advocate of the electric light, stated in 1878, that ths Brush and other machines, render light up to 1,200 candles per horse power.§

Similarly to Mr. Briggs's method, we may find the practical relation hetween the costs of the two lights, as follows: One cuhic foot of gas comes from one-quater pound of coal; one pound of coal is equivalent to 15,000 heat units; Therefors 15,000÷4=3,725 heat units correspond to 1 cuhic foot gas; now the merchantable residues of gas making amount in Bristol to less than 30% of the cost of coal;‡ and in America to much less than in Bristol;‖ allowing then 30%, we must suhtract from the 3,725 units 30÷100×3,725=1,117, leaving thus 3,609 heat units corresponding to 1 cuhic foot of gas, which equals 3 standard candles; hence a standard candle represents 3,608÷3=1,203 heat units sxpendsd.

Now, for electricity, we know that a horse power consumes from 2 to 6 pounds of coal per hour; taking the 6 pounds, 1-horse power will be equivalent to 90,000 heat units per hour; if ws call N the numher of candles produced hy 1-horse power, $90{,}000 \div N$ will represent the numher of heat units per candle power spent by slectricity; the relation then stands:

$$\frac{\text{Heat consumed by gas}}{\text{Heat consumed by electricity}} = \frac{1{,}203}{\frac{90{,}000}{N}} = R\text{; therefore}$$

When N=500 candles, then $R = \frac{6.6}{1}$

" N=1,000 " " $R = \frac{13.2}{1}$

" N=2,000 " " $R = \frac{26.7}{1}$

" N=3,000 " " $R = \frac{40}{1}$

And so ou. Thess relations are not exaggerated because we have to add to the cost of the fuel the cost of carhon points.

This is why Dr. Siemens, of London, said that one pound of coal thrown into the engine that drives an electric machine, will give 15 times more light thau if thrown into a gas retort to make coal gas.*

This also proves the assertion of Mr. H. Fontaine, mentioned above, who, after several years of constant experiments, and careful attention to this suhject, has come to the conclusion, since 1877, that whenever the electric light is produced in quantities of 300 candles or more, it is cheapsr than gaslight, and when produced in amounts of 7,500 candles and over, even if three-fourths of said amounts are wasted, ths electric light is much cheaper than gaslight.

For practical instances of the cheapness of ths electric light ws will remind you of the trial made as early as in 1873–74 at the tower of the Houses of Parliament, London, where an old pattern of the Gramme machine was used: the light was of 7,000 candles; its actual cost one-eighth the price of London gas.†

Later, the comparison hetween the two lights mads hy the engineers of the Trinity House Board was, that when the intensity of gaslight was two-thirds of that of the electric light, the cost of gas was one-third ahovs that of electricity.‡

Again, the use of the Jablochkoff system at the Hotel and Magasins du Louvrs in Paris for over 18 months, since 1877, shows that they are spending for light two-thirds of what they used to pay for gas hills, and they get nearly three times as much light as before.§ We will remark that the Jahlochkoff's is not the cheapest electrical system.

Then, we have the instance of ths Alhert hall, London, last February, where the actual cost of the electric light was one-third the amount of the gas bill, at London prices; and which, at the San Francisco prices, would have heen less than ons-sixth the cost of gas.‖

Then, we have the statement of Mr. Geo. Deacon, the engineer of the town council of Liverpool, who was sent to Paris during the summer of 1878, for the especial purpose of studying the lighting question. In his able and full report, hs advises the town council not to adopt yet ths electric light, on account of the difficulty of managing it. But he admits, as far as the cost of production goes, that wheu produced at the rate of 15,000 candles, the cost of electric light has been as low as one-fifth the cost of gaslight.**

Theu Mr. J. H. Schoolhred, alrcady mentioned, hrought to notice, last December, several instances of actual practice, where the cost of electric light is a fraction of that of gaslight.††

Finally, Mr. J. N. Douglass, also msntioned ahove, at a lecture delivered last March, stated the conclusions arrived at, after the extensivs and exhaustive experiments carried on at different times hy the Trinity House Corporation. He said that for an intensity of light of 5,000 candles and upwards, electric light is cheaper than gaslight; that for said intensity of 5,000 candles, the cost of electric light is less than half the cost of gaslight; and that electric light decreases in cost per unit in ratio of its augmented power, no further addition to the working staff and hut little extra expenditure for huildings and plant being necessary for an intensity of 40,000 candles.‡‡

To present any more practical instances would he tiresome for you.

Hers we have the definite statements of several experts, all well qualified in every respect for this question; they take different series of experiments, made at diffcrent localities, as hasis for their assertions; and they all come to the conclusion that in amounts not larger than 15,000 candles, electric light costs from ons-fifth to one-eighth of the cost of gaslight. And one of the experts declares that practice corroborates the fact that for larger intensities the cost per unit of electric light decreases in ratio of its augmented power.

Therefore it is quite natural tbat when the electric light be produced, not in amounts of 15,000 candles, hut in amounts of 1,000,000 or 2,000,000 candles, its cost will not he more than one-twentieth that of gas, as we had stated.

III.—Losses or Waste of our Optical System.

These are due to the reflections and refractions of light; and to the absorhtion of the

---

*As an interesting fact we will notice that there are in San Francisco about 13,000 buildings supplied with gas; the average cost of their gas pipes and gas fixtures is at a low estimate $1,000 per building; making in all $13,000,000, which is more than twice the capital needed to build new gas works to supply the whole city. The repairs of those fixtures, the taxes and the interest of that money represent over $3,000,000 yearly; whereas the total amount of the yearly gas bills paid to the San Francisco Gas Co. is only $1,500,000. Therefore the community in San Francisco pays on account of the gas fixtures nearly 140% of what it pays for gas bills. That makes the price of gas over $7 per thousand instead of $3.

atmosphsre on account nf the distance traveled by the light.

Thers will be net more than six reflections or changes nf direction of light needed to put our system in practice.

In the streets we can always go from a crossing to any placn in a city, having rectangular blocks, witb one change of direction. Only in the case of going into an alley in the middle of a block, there will bs needed two changes. Considering thnt such cases are comparatively fsw, and thnt the streets where the mnin beams of light are hnve no change of direction, we may say that one chauge of direction nr one reflection is needed to supply streets with ligbt.

For buildings we need one change of direction from the strect main to the service pipe; a second change from the service pipe into a vertical supply pipe; a third change from the latter into the different horizontal supply pipes for every floor: the rooms that are not in the liue of the horizoutal supply pipe need a fourth change from it into a lateral branch; thsn we nced at every room a fifth change of direction to go from tho last pipe into the room. That makes five changes of direction or live reflections, at most, needed to supply a building with light.

The street lamps will need from two to four reflections, according to location. The sum nf all these reflections gives an average of less than six, as said before.

Then our light has to pase through the primnry lenses or chamber of light, nnd through the secondary lenses. Everytime that light passes througb one lens, it losses about 6% of its intensity, according to the mean of Sir J. Herschel's and Lambert's experiments.*

And according to Sir Herschel† nnd Dr. Lommel‡ the loss of light by reflection is:

After reflection on polished glass	about	96%
" " " mercury	"	40%
" " " polished speculum metal	"	34%
" " " " silver	"	9%
" " through a totally refracting prism	"	8%

Therefore tbe loeses of our system will be: First, a loss of 6%, then six succesive loseces of 8% each; then another loss of 6%.

If we call L the intensity of the original light, and L^1 that of the distributed light, the formula to find L^1 will be this:

$$L^1 = \frac{L \times (94)^2 \times (92)^6}{(100)^8} = 53.57\ L;$$

tbe loss, then, amounts to 46.43%.

Ae for the loss due to absorbtion in the travel of light along the tubes, we find that according to accurate experiments made by Mr. Bouger,§ a well-known French scientist, light loses 2.7% in intensity after passing throngh a stratum of pure atmosphere one kilometer in thickness. Then, Maj. P. C. Hains‖, the Engineer Secretary of the L. H. Board, U. S. A., eaye that according to experiments made all along the Atlantic coast, the transpareney of the atmosphere is such that, during six montbe in the year, light will lose only 9.7% in traversing said distance of one kilometer; that in eome cases the transparency is euch as to cause a loss of only 3.4%, although in some cases the lose amounts to 25%.

Now, considering that the pipes enclosing the light are not subject to the atmospheric changes of weather, that occur along the shore line where said experiments were carried, we may safely assume that, in our case, we will not lose more than 10% for that distance: 1 kilometer =3,281 feet; calculating the losses for various distances, we find:

Loss at 400 ft. distance	012
Loss at 800 ft. distance	023
Loss at 1600 ft. distance	047
Loss at 3200 ft. distance	097

In a city the central stations of light, wberefrom to distribute it, need not be more than 6,400 feet apart. With such distances in San Francisco, four stations would be enough to supply all that part of the city inside of the charter line of 1851. In euch a case, the loss for the most distant point will be 9.7%; but the average lose will be that corresponding to a distance of 1,600 feet, which is 4.7%. That loss, on our last amount of light of 53.57L, gives an additional loss of 2.52, which, added to our former loss of 46.43, makes a total loss of 48.95%, or less than 50%. And the formula to find the final amount of light, l, received by the consumers will be:

$$l = \frac{L^1 \times 95.3}{100} = \frac{L \times 94^2 \times 92^6 \times 95.3}{(100)^9} = 51.05L.$$

IV.—Other Economical Advantagee of our Syetem.

But besides these losses, our system can easily take advantage of an additional source of light, because, as Mr. J. Jamin, of the Paris Academy of Sciences, stated laet year,** tbe quinine sulphate has the property of changing the blue, violet, and ultra-violet rays into white light, and, at the same time, it renders visible and useful, radiations wbich the eye could not perceive, thus adding considerably to the hrilliancy or intensity of the light. Uranium glass, and many otber substances, act in tbe same manner, and present tbe means of suppressing the rays wbich are objectionable in the electric light.

In order to take advantage of this property, we bave only to surround any eleotric light by some of thess substances. But in the methods of electric lighting heretofore proposed, where a great number of electric lamps are used, such a process would bs extremely expensive, inconvenient, nnd linble to get nut of order. Whereas our proposed method of distributing light reuders that operation as simple and low-priced as possible; because we need to surround only *one* chamber of light with the required substance, and nll the smaller lights fed by it, whether in hundreds nr in thousauds, will be affected accordingly. Cousequently the loss of 49%, hereinbefore mentioned, may, on account of this circumstance, be grently reduced, with almost no expense.

Another of the great ecenomical advantages of our new system of divisibility of the electric light upon any other is on account of the conducter connecting the generntor nf electricity with the lnmp or lamps.

As we have snid, the expense for electric conductors in a city will be enormous; but tbey have still another advantago, as being a great source of lose of electricity. Mr. J. N. Douglass, in the experimeuts above mentioned, fonnd that when the current of electricity traveled a distance of about 1,300 feet, before reaching the lamp, the intensity of light suffered a loss from 58% to 80%; and for a distance of 600 feet, from 27% to 37%. Then Messrs. Siemens, the engineers of London, furnished a larger cable, as conductor. It was well insulated and especially adapted for their dynamo-electric machines; and even then the lose of light in a distance of 1,400 feet varied from 23% to 35%.*

As in our system of distrihution of light, the dynamo-electric machine may always be placed a few feet only from the elèctric lamp, it is evident that our system is the only one which can avoid both the high expense of cables and conductors, and the losses they produce.

In conclusion, we will compare the practical distribution of a light produced by a 25 borse-power engine, or 15,000 candle light, which is not the most advantageous case we might take, and we will see what amount of light we will obtain by the different proposed methods.

In the Jablochkoff method we will obtain 25 burners of less than 940 candles each, or less than 23,500 candles in the aggregate, provided it is possible to build a machine of 25 horse power, feeding 25 lamps; heretofore only 16 or 20 lnmps have been fed.

In the Edison system, according to the most recent reports, with 2½ horse-power engine, 14 lamps are obtained of from 18 to 20 candle power each. If we take a 25 horse-power machine we will obtain 10 timee as much electricity, but then the number of lamps increasing to 140 for instance, the loss will increase in a larger proportion; therefore we will take 10 machines of 2½ horse power each, and will obtain 140 lamps of 20 candles each.

In the Brush system we will obtain 36 lamps, giving 70,000 candles in all.

Iu the Werdermann system, 2 horse power gives 10 lamps of 40 candles each; taking 13 such machines we would obtain 130 lamps of 40 candles.

In our system we will obtain 82,500 candles, which can be divided into 8,250 lights of 10 candles each, or 4,124 lights of 20 candles each. Now we have:

NAME.	No. of Lights.	Total Candle Power.	ADAPTATION.
Jablochkoff	25	23,500	Large spaces.
Werdermann	130	5,200	Small spaces.
Brush	36	70,000	Large spaces.
Edison	140	2,800	Small spaces.
Molera & Cebrian.	82,500	82,500	Large and small spaces.

Or taking the horse power per unit:

NAME.	Number of Lights.	Candle Power.
Jablochkoff	1	940
Werdermann	5.2	200
Brush	1.44	2,800
Edison	5.6	300
Molera & Cebrian	3,300	8,700

Engineering, October 26th, 1877.

[Concluded.]

A Singular and Valuable Curiosity.—A specimen of the handiwork of tbe ancient Spanish miners inhabiting this Territory was bronght to town from the Cerrillos mines, a day or two since, and is now on exhibition at the office of Gen. Atkinson. It is a casting from what seems to be pure silver, and is, taking a front view, in the shape of a crown. At the base it is 2½ inches thick, at the top 2 inches, and at the sides 1½ inches. Its greatest width is 6½ inches, and from the top to the bottom 6 inches. Its weight is 9 pounds and 14 ounces. If pure silver, its intrinsic value is about $150, but there is supposed to be some gold in it, which, of course, would add to its value. This remarkable ingot was discovered under a boulder, about half a mile to the southeast of tbe celebrated Turquise mine, in tbe midst of tbe new discoveries. It must have lain there at the leust since 1680, as uo working in tbese mines was done by tbe Spaniards after the uprising of the Indians during that year. It is well known that royalties were required of the miners by the old kings of Spain, and tbis may have been cast to be used in payment of his demand; but on account of its peculiar form it is more likely that it was intended as a present to the king. Wbatever may be tbe true solution of the question, it certainly is one of the most interestiug curiosities ever found in this region of country.—*Santa Fe New Mexican.*

Useful Information.

Consumption of Rubber.—The consumption of rubber by our manufacturers continues as large as ever, imports amountiug to about 12,000,000 pounds per nnnum, chiefly from South America. The price ranges from 20 to 50 cents per pound, the cheaper grades coming from Africa and the finest from the valley of the Amazon, where the trees producing it abound over a vast region, one-half of the entire yield going to the United States. The consumption in the manufacture of shoes equals the demand for all nther purposes. In the manufacture of rubber from 3% to 10% nf sulphur, and various metallic oxides—chiefly lead and zinc—are combined with it; the quautity of the latter depending on the degree of clasticity and other properties required in the article to be manufactured; and to judiciously combine these substances with tho rubber in suitable proportions to produce the desired end, as well as in properly vulcauizing it nfterwards, requires great experience and skill. A certain degree of honesty on the part of the manufacturer is also essentinl to abstain from iutroducing mere ndulterating substances into his "compouuds," and thus cheapen the product at the expense of its quality.

A New Process for Copying Drawings.—The *Engineer* describes a new process for copying drawings, when only a few copies are needed, say 20 or 25, as follows: It has lately been brought out in Paris, and is said to be very useful. The apparatus consists of a shallow zinc tray, in which is contained a smooth, jelly-like, cream-colored substance, resembling in some degree partially solidified flour paste. The drawing to be copied is made with a special ink. As soon as it is dry it is turned face downward on the contents of the tray. The back of the drawing is tben rubbed over witb the band. The sheet is then lifted up, leaving much of the ink trnnsferred to the substance in the tray. A sheet of clean paper now takes the place of the drawing, and by rubbing it over gently with the hand an accurate copy of the original is obtained. Witb care, as many as 100 copies cau be had. When all that are needed have been taken, the composition in the tray is wasbed with a damp sponge, and is then rendy for use again. The nature of the composition bas not been made public.

Process for Preparing Sulphate of Baryta for Painting.—Pure amorphous sulphate of baryta may be used as a water color, but not as an oil paint. The sulphate gained hy precipitation hy sulphuric acid of the chloride or some other soluble baryta salt, called "blanc fixe," forms, mixed with linseed oil, a glassy, granular mass. The precipitate obtained by a solution of sulphate behaves similarly, although in an inferior degree. Meissner proposes to dry the precipitate obtained by means of a sulphate, and heating the same as soon as possible after precipitation to a red heat in a muffle. The mass is, while yet glowing, thrown into water. By this sudden change of temperature the sulphate of baryta is altered to a considerable degree. After being dried, ground and levigated with a small quantity of linseed oil, it mixes readily witb the required proportion of the latter, and forms a white paint equal in all respects to white lead. If the paint shall merely serve as a body for different shades of other colors, the latter must he added to the water.—*Deutsche Gewerbe Zeitung.*

A Varnish for Replacing Turpentine and Linseed Oil Paints.—Fr. Thies, of Bissendorf, prepares a varnish consisting of 100 parts of colophonium, 20 parts of crystallized carbenate of sodium, and 50 parts of water, by heating these substances together and mixing them with a solution of 24 parts of strong liquor of ammonia in 250 parts of water. With the mass thne obtained, the pigments are levigated without the addition of linseed oil or turpentine; the paint dries readily without the aid of a drier, and looks very well especially when varnished. Tbe paint keeps well even nnder water and becomes very hard. The cost is said to amouut to about one-third of that of ordinary oil paints.—*Deutsche Gewerbe Zeitung.*

Feathers in Textiles.—According to the Paris *Figaro*, the shops will soon have the new textiles in feathers and wool and cotton on sale. This is an inveution of M. Bourguignon, of Donchery, who has found hnw to weave feathers (deprived of the horny substance) and incorporate them with woolen and cotton yarns in proportions varying from 10% to 75%. Some very fine textilcs are thus made, and especially a flannel which for warmth and lightness is unapproachable.

Purifyino Oil of Cognac.—The beautiful green color so often met with in the oil of cognac, imported from Europe, is generally derived from an appreciable quantity of copper, which, of course, must render the liquor made from it highly injurious. To purify the oil heat it to about 114° F., and shake with one-tenth of its volume or a saturated solution of tartaric acid. Set aside for one-balf hour and filter.

To Chill Cast Iron Very Hard.—Use a liquid made as follows: Soft water, 10 gallons; salt, 1 peck; oil vitriol, ½ pint; saltpeter, ½ pound; prussiate of potash, ¼ pound; cyanide of potash, ½ pound. Heat the iron a cherry-red and dip as usnal, and if wanted barder, repeat the process.

Good Health.

Faintness and its Causes.

Fnintness consists in a temporary failure of the nctivity of the heart; the bleed, in consequencc, is not properly circulated. It does net rench the head, and the patient lescs clearness of vision and color, and, if uot prevented, falls to the floor, where, however, or even before reacbiug it, he recovers. There is no convulsion, and, though he cau scarcely be said to be conscious, he is uot profonudly unconscious, so as net to be able to be aroused, as happens in epilepsy.

There are all degrees of fnintness, from merely feeling faint aud looking slightly palc, to the state we have described; aud in some cnses the stnte of fainting is hardly recovered from well before it recurs again and ngain, for hours aud daye together. We nsed hardly say that euch cascs as the latter are altogether beyond the reach of domestic medicine. What are the causes of faintness? It is not very difficult to describe these. Some people are so easily affected that they faint if they cut their finger, or even if they only see the cut finger of another persou. All one can say of such persons is that their muscular fiber is not strong and that their nerves are sensitive. The heart, which goes on for ycars circulating the blood, is esssntinlly a muscle. It is weak in some people, stronger in others. As a rule it is weaker in women and strouger in men. Hence women faint more rupidly than mcn. Whatever weakens the heart and the muscles generally acts as a cause of faintness. Close, foul air is a common cause of faintness or of languidness. Anything which greatly affects the nervous syetem, such as bad news or the sight of something horrible or disagreeable, will sometimes cause fainting.

But of all causes of faintness, none are so serious as the loss of blood. The muscles, in order to act well, must be supplied with blood, and if the blood of the body is lost—if it escapes, either from a veiu opened purposely, or from piles, or from the source from which menstruatiou preceeds—iu excessive quantity, then faintness will happen. The degree of it will depend on the constitution and on the amount of blood lost. A loss of blood tbat would scarcely be felt by one person will be serious cause of faintness to another. Sometimes frequent faintness arises from becoming very fat, the muscular system of the heart being impaired by fatty deposit.—*Cassell's Household Guide.*

A Remedy for Whooping Cough.—Dr. Gartb (*Wiener Allgem.*) states tbat by placing xx. gtt. ol. terebinth. on a handkercbief, holding it before the face, and taking about 40 deep inspirations, to be repeated thrice daily, eignal and marked relief, followed by rapid cure in cases of laryngeal catarrh, is the result. In an infant 15 months old, in the convulsive stage of whooping cough, he directed the mother to hold a cloth, moistened as above, before it when awake, and to drop the oil upon its pillow when asleep. The result was markedly beneficial. In 24 hours the frequency and severity of the attacks were notably diminished, and by proper support by aid of stimulants, the improvement was rapid. Subsequently pertussis became epidemic in his vicinity, and he repeatedly used the drug in this way. He gave it to children of all ages, nnd in any stage of fever. The initial catarrh, the convulsive, and the final catarrhal stages were all decidedly benefited, the spasmodic attacks being in many cases aborted.

The Odor of Human Hair.—In *Le Progres Medical*, M. Galippe calls attention to the medico-legal value of the odor of the human hair. He asserts that from the simple smell of a lock of hair he can tell whether the lock has been cut from the living subject or whether it has been composed of hair that has fallen out. Hair-dressers have acquired this art, whicb is said never to fail them. Hair which has fallen out has a dull appearance, attributable to disease, and is not easily made up; it bas no peculiar smell. Tbe hair of the Chiuese has a characteristic odor of musk, which is so persistent that it cannot be concealed by cosmetics, for it cannot he destroyed by washing with potash. The hair of the Chinese has also a reddish tinge, and is polyhedral in section. Hair of hysterical patieuts has a peculiar and distinguishing odor which is most perceptible at the approach of a crisis. Certain hair is electrical, the electricity being developed more readily after rubbing.

Freshly Painted Rooms.—The impression that those who inhabit rooms freshly painted are in danger of lead poisoning has been shown by Dr. Clement Biddle to be quite unfounded. He bases this statement upon the result of the following experiment: He introduced into a close box a number of sheets of paper saturated with white (lead) paint, aud upon the bottom of the box placed a shallow dish of pure (distilled) water, previously tested to make sure of its perfect freedom from impurities, and from lead in particular. After an exposure to the atmospbere of the box for three days, the water-dish was removed, acidulated with nitric acid, and treated with sulphureted hydrogen, when not a trace of lead precipitate occurred. Dr. Biddle therefore attributes tbe colds and other unpleasant consequencee experienced by sleeping in freshly-painted apartments to tbe irritating action of the vapors of turpentine on the lining membrane of the air-passages,

The Week.

The blow of the pick, the ring of the hammer, the roar of the hlast, and the echo of the anvil have made sweet and constant music in the miner's ear during the months just passed, and from all sides, without exception, come reports corroborative of the richnese of the rnns. True, from some quartere complaints are already made of a lack of water, hut from the majority the only regret is that there is not more time each day to work. In California, San Luis Obispo reports finds of tellurium in paying quantities; Calaveras ie sinking shafts and erecting quartz mills; Inyo is staking out claime and opening new prospects; Nevada and Placer are resting somewhat from their lahors and beginuing to "clean up;" while Trinity ehows new life in the transfer of her hest mines into other hands and hetter management. In Oregon the mining prospect is over cheerful, and interest and activity are spreading every day. From Nevada the assertion comes that White Pine has developed rich placer diggings calculated to place her at the head of Nevada's gold producers and restore her wonted prestige as a mining camp. The prospects in Arizona continue hrilliant. In Colorado the Leadville excitement has been somewhat transferred to Silver Cliff, Ten Mile and Fairplay. Utah is producing large quantities of excellent ore, and Idaho is wide awake and only needs more capital to bring her to the front.

THE value of merchandise and produce exports since May 1st, aggregates $1,500,000.

Overrating the Value of Mining Properties.

Lying in Beaver county, in the southern pert of Utah, and reaching from the Oquirrh mountains to Arizona, is an extensive mineral region embracing San Francisco, Camp Floyd, Bradshaw, Star, Lincoln, West Tintic, Rocky, Beaver Lake, Pruess, Tom Paine and three or four other mining districts. This region abounds with ore-hearing veins carrying silver, copper, iron aud lead. As a general thing the ores here are of fair and sometimes of very high grade. Limestone is the prevailing formation of the country, with much porphyry, granite and hornblende, these rocks generally forming one or hoth walls of the lodes. The lead ores are mostly of the carhonate variety aud adapted to smelting. There are elso free milling ores here, hence hoth furnaces and mills are in use for reduction purposes. The lodes are as a general thing large, well walled and regular, occupying apparently true fissures.

The mines of Beaver county were discovered a numher of years ago, and although a good deal of work has since heen done upon them, the developments made are not at all proportional to the seeming importauce of the mineral deposits, the remoteness of thie region from railroads having tended to retard its progress. The Uteh Southern railroad having heen gradually extended until it has now reached the neighborhood of these mines, the latter are beginning to attract more attention; and it will not probahly he long till we shall eee mining operations pushed here as well as throughout other portions of southern and southwestern Utah with more energy and effect. The fame of the Ontario, Silver Reef, Leeds and other mines and mining localities lying off that way, has already tended to advertise that country and draw to its aid capital from ahroad.

While these mines are extensive and possess no doubt a fair share of merit, it should he horne in mind that two or three good properties do not make a country, nor does the presence of a bonanza in one lode argue anything in favor of another, however similar in its external features or close at hand. There is euch a thing ae a mining company doing a flourishing business on the reputation of its neighbor, without possessing any real worth of its own. We throw out these cautionary hints because efforts are heing made just now to dispose of certain of these Utah mines ahroad or to float their shares on the Eastern market at extravagant figures, and which efforts, if successful, must react unfavorahly not only upon the miniug intercsts of Utah, hut of this coast generally. We took occasion not long since to comment on the palpahle fraud threatened to he perpetrated on French investors through the sale to them of the old Telegraph mine over in that Territory at a price out of all proportion to its actual value. The corroboration of the view we then expressed of that husiness hy so good an authority as the *Engineering and Mining Journal*, satisfiee us of its correctness.

Latterly we observe that the shares of the Horn Silver mine, situated in the San Francisco district, southern Utah, are being dealt in at what we should consider pretty steep prices, this property having not long since been disposed of to Eastern investors. The Horn Silver is one of the famous mines of Beaver county, having been greatly extolled by the Territorial press, hy traveling correspondents, mining experts and others. It occupies a section of a strong lode and has been quite extensively opened up hy means of ehafts, drifts, crosscuts, etc., all in ore and without anywhere pinching, faulting or showing a disposition toward impoverishment, no horse or waste matter occurring in tbe ore body. The great mass of the ore rcquires reduction by emelting, though a portion of it can be successfully treated hy the mill process, having quartz and spar as a matrix. Active operations were commenced on this mine ahout three years ago, since which time a considerable amount of hullion has heen taken from it with good profits. Even with the comparatively small amount of developments made, large ore reserves have been established in the mine, some experts having estimated the value of the ore in sight at several million dollars. In ehort, the mine looks well, has heen properly opened and managed, has a good record and is really a valuable property.

But the question arises, is it worth anything like the money Eastern investors are paying for it? We think we have the means for answering this questiou correctly and intelligently. We have recently heen shown a letter from Col. Taylor, one of the most capahle mining engineers iu the country, who, at the solicitation of Eastern capitalists, examined the Horn Silver mine and gave his opinion upon it. From this letter, though not intended for the puhlic eye, we venture to puhlish such portions as hear directly upon the prohahle value of this property, which it will he eeen is placed at a very moderate figure. In this letter, under date of April 5th, 1879, occurs the following: "I examined the Horn Silver mine on the 24th nlt. The greatest depth to which the lode has heen opened up is 317 feet. No exploration of consequence has, however, heen made helow the 150-foot level. On this level the ore body shows a width of ahout 75 feet and a length of 200 feet, stoping having heen carried from this point up to the 50-foot level. The mine carriee a variety of ores, the major part consisting of gray carbonates whioh lie next to tbe east or hanging wall. In contect with this occurs a stratum of horn silver, mixed with chloride and ruhy ores, from which I ohtained an assay value of $247 per ton. I could form no close estimate of the extent of this stratum, as it had heen cut through at only two or three points when I visited the mine. It appeared, however, to make in greatest strength towards the south. The gangue is a light, sedimentary deposit, similar to thet found in the Leeds district. The bulk of the ore here is of low grade, conteining ahout $40 in silver and 35% lead. The ore exposure, however, is great. Hardly ever have I seen elsewhere so large a hody of fair grade ore developed at the seme depth. It is also uniform in character and promises persistence in depth. The strength of the vein, the walls and country rock, point to a broad permanent fissure. Everthing considered, one million dollars might he regarded as a fair price for the property." Whether the above will be of any use to dealers in Horn Silver shares or not, we cen assure them the opinion is a candid one, and comes from a sonrce that entitles it to weight.

It may further be observed in this connection, that Prof. Clayton, of Selt Lake, during a recent eojourn in New York, has heen giving Eastern communitiee some wholesome and timely advice in regard to investing in mining properties and the practical management of mines, his suggestions heing intended to apply more especially to operatious in this same Utah Territory. And we cannot help ftbinking that these Eastern as well as French investors ought to consider themeelves fortuuate to get the benefit of the unbought views of men like Joshua E. Clayton, Rossiter W. Raymond and Isaac M. Taylor when about to engage in mining enterprises of magnitude, or to emhark their money in stock speculations. These views are of course hy no means infallihle, yet coming from a quarter so intelligeut and disinterested they furnish the best lights availahle for our guidance in a businese so inherently difficult and financially dangerous.

We Must Kill Them or They Will Kill Us.

We mean our foolish, improvident and healthdestroying habits. It is reduced to just that alternative. To go on without change is eimply to perish. We may talk ahout land grahbing, and monopolies and stock gambling, all had enough, but it is the evil habite of the masses that are their real oppressors, and unlese they can find emancipation from these their damnation is certain. There comes up from the million a moan of want aud a pleading for work; hut this same million the moment they have earned a dollar will rush off and spend the major part of it in some inexcusahly foolish or criminally wasteful manner. And thus their time, cnergies and means are consumed to no good, hut very ofteu to only a had purpose. Over a thousand men are idle on the Comstock. For months they have heen without work, living from hand to mouth, and mostly on credit. Then they get employment at four and five dollars a day in the Sutro tuunel. These are good wages, and with economy they could save more than one-half their earnings. But the most of them save little or nothing. The gamhlers and saloon-keepers get 75% of their wages. Half the huildings in the town of Sutro are devoted to dice, card dealing and the liquor traffic. A new whisky shop is opened there every day in the week, and a place of thie kind having been opened never closes. It is run day and night, week days and Sundays, and will so go on till the town suffers a collapse and the miners, joining the hrigade of the dead-broke, decamp in eearch of other quarters. So addicted is this class to these spendthrift waye and vicious pastimes, that the husiness prosperity of a mining camp can well he measured hy tbe number of these dens it is ahle to support.

But these and like follies are not confined to mountain towns and the miners. They are indulged in hy the masses everywhere. If in the city a man or woman is advertised to walk on a wager thousands flock to see them, gaping and gassing and working themselves into an excitement, even though the thing is a sell throughout. And so of the horse racee, billiard games, hoxing matches and other put-up johs of this kind. Start anything of the sensational order and it is easy to wring a few thousands out of the hard fists of the working people.

If an idle fellow gets him into an India ruhher eack and floats down Western rivers the people will gather in crowde and receive him with acclamations, firing rockets aud ringing hells as if some great conqueror had arrived at their place. Presuming upon the purient taste of the puhlic, an ignorant and vulgar creature of doubtful sex sets out to lecture, and makes the hueiness a financial success just hecause this undefined nastiuess happens to suit the popular nalate.

The misery and impoverishment of the masses are due mainly to their excesses and follies. They are slaves to their appetites and passions, and from thie hondage they can alone set themselves free. We have nursed into a troublesome vigor too many superfluous wants and must set about getting rid of them. We must reduce the calendar of our idle days, curtail unuecessary expenses and learn to live more within our means or our condition as a people can never he improved. And in effecting this amendment it will not do to rely upon the teacbings or labors of others, every man will have to he his own reformer.

The Lead Silver Mines.

Notwithstanding silver is growing slightly in favor, with some prospect of its free coinege here and its remonetizetion in Englend and perhaps other European countries, operations on the ahove class of mines are undergoing extensive curteilment by reason of the extreme low prices of lead. In Utah a large number of furnaces have already shut down, while at Eureka, the great smelting camp of Nevada, though they still keep their reduction works in full blast the most of tbe lead is piled up at home, being retained for hetter prices. That the chances of realizing this expectation are slender may be inferred from the fact that the production of this metal, already so greetly in excess of demand, is likely to go on at a rapidly increasing rate without any corresponding increment of consumption. More leed is, of course, every year being used, but the growth of this use fails to keep pace with that of production.

Utah, Nevada and Colorado heve heen of late yeare our principal lead-producing countries; Missouri and eome of the other Western States, for many years hefore the chief sources of home supply, having also continued to turn out this metal in diminished quantity. Just now Nevada ie meking the larger portion of the refined article, though hut little of it is going forward to market; the leading mines in this State holding back the most of their desilverized product, which, at the present prices of leed and cost of carriage, would hardly more than cover charges of transportation to the seaboard. Recently this industry has experienced some revival ahout Galena and in the lead-yielding districts of Missouri, whereby the bueiness is likely to be further prostrated through a growing competition hetween these regions of the Middle West and the Far West, each of which enjoys some advantages favoring cheap production peculiar to itself. In the former the plumhiferoue oree occur in great ahundance near the surface, the miner hardly ever pursuing them to any great depth. When he reaches a depth where hoieting hecomes lahorious or water troublesome, he ahandons his workings and starts in at a new place, thereby avoiding hoth outlay and risk The ores here are rich iu metal, transportation and labor are cheap, and while the original outlay ie small, the introduction of lahor-saving appliances have not heen neglected, nor have eystematic methods of procedure heen overlooked. In the Far West the ores carry a large percentagc of silver, hut they lie deep, necessitating heavy expenditure in opening and exploring the mines and hringing the ores to hank, hoth reduction and transportation, as well as labor, being here exceedingly costly.

While the United States have ahout ceased to import lead, we have still strong competitors ahroad for the markets of the world, England, Spain and Italy, all making more than enough for their home wants. For more than half a century England's yearly output has varied from 75,000 to 100,000 tons, her present annual yield amounting to ahout 57,000 tons, of which her domestic requirements ahsorb all hut 7,000 tons. England imports this metal from Italy and Spaiu and exports it to France, Russia and China. The working and administration of her own mines show the perfection of system and economy, that country being distinguished for everything that is cheap as well ae for advanced metallurgical skill. Lead mining is, however, on the decline in England, the number of hands employed at the husiness diminishing slightly every year, and the outlook not heing such as to encourage an expansion of the interest. The lead product of Spain amounts to ahout the same ae that of Great Britain, Italy turning out less but a variahle quantity. Germany produces ahout 50,000 tons annually, and varioue other countriee in Europe small lots, the total European product being ahout 250,000 tons per year.

The total product of lead in the United States amounted, in 1878, to 81,304 tons against 73,325 the year hefore. Of last year's production Utah turned out 19,310 tons; Nevada, 27,735 tons; Colorado, 6,500 tons; California, 3,857 tons; and Missouri and Galena, 23,902 tons. Comparing the product of these two yeare, Utah shows a falling off of over 2,000, and Missouri and Galena of 4,000 tons, wbile Nevada shows an increase of 10,000 tons, Colorado of 4,000 tons, and California of a few hundred tons. Our home consumption amounted last year to 70,908 tone, and our exports to 7,396 tons, of which we sent 725 tons in pigs and 1,350 tons in cartridges to Europe and 5,321 tons in pige to China. The consumption of this metal was larger last year than in 1877, and there is every reason to helieve our home requirements will increase steadily hereafter. That American production will, however, increase much more rapidly than consumption is a state of things that producers ehould anticipate and endeavor to find for the surplus a profitahle ontlet. Being so much nearer to the Orient than the European producer, we should he ahle to command the markets of China and Japan, which, if secured to our trade, would he ample to the ahsorption of our surplus production. At the heginning of 1878 ordinary lead was quoted in the New York market at four and a half cents. It afterwards fell to 3.05 ceuts, hut later in the year advanced to 4 cents, from which there bas since been a slight falling off in consequence of the large actual and prospective out-put of our bome mines.

Rewashing the Gold-Bearing Debris from our Mines.

Having tried in late nnmbers of the PRESS to point out to laboring men such localities as seemed most likely to afford them opportunities to get employment or to employ themselves, we attempt in turn to indicate as far as may be the places and classes of mines that most strongly invito the attention of capitalists and others desirons of investing in mining properties of an especially safe and permanent kind, and of which we believe more can be found in California than in any other country west of the Missonri river. We have here no mines that have made bullion like a few on the Comstock lode, nor have there been found in this State any such metalliferous deposite as those reported at Leadville. But we have mines that have yielded steadily and satisfactorily ever since they were opened, a period, in some instances, of 20 years or more. Our mines do not yield by fits and starts, producing enormously for a year or two and then ceasing for ten, or perhaps altogether. They are distinguished for their steady returns and staying qualities, some of our placer mines being noted in this respect. With the knowledge we have gained of our various mineral deposits and the means best adapted for opening and working them, we can calculate beforehand expenditure and income, and sometimes also the probable duration of their fruitful season with considerable closeness.

In handling the auriferous debris or tailings, likely soon to assume a conspicuous place among this class of our resources, we have data that enables us to make these estimates with approximate exactness. In no department of mining, indeed, can the way be seen so far ahead and so clearly as in this. Before embarking in the business we can measure the quantity of the stuff to be operated upon, ascertain its quality and compute very nearly the expense of outfit and the cost of moving it. It can also be seen beforehand how much water will be required, where it is to come from and what disposition is to be made of the waste matter after being subjected to a rewashing. As to both the manner of carrying on this style of mining and the results obtained, none need be in the dark, the business having been in active progress at several points in this State for a number of years past. The most notable examples of debris washing are to be seen on Canyon creek, near Gold Run, in Placer county, where two sets of claims, the Kinder and the Moody, have for a long time been in successful operation. From the former, and larger of these claims, the yearly clean-up has ranged from $20,000 to $60,000, the yield of the latter having been about one-third as much. At these places the stuff rewashed consists now almost wholly of the fresh tailings escaping from the two or three hydraulic mines running in the neighborhood, the older and richer deposits formerly lodged in Canyon creek, having been long since run off. And yet with only this poorer material the owners of these claims clean up in the aggregate a yearly average of at least $50,000, four-fifths of which consist of net profits. The cost of these properties, purchase money, equipment and everything else included, falls considerably short of $100,000. But this plan of catching up the debris discharged from active mines is not extensively practiced, owing to the limited quantity of material so to be had and to a general lack of facilities for carrying it on successfully.

It is upon the tailings that have lodged in the beds of the gulches and streams which afford outlet to the hydraulic mines, and there accumulated in immense quantities, that this class of operations are to be prosecuted upon a large scale. While this material is so very abundant, filling the beds of large rivers continuously for many miles, only in a few localities does it exist under conditions favorable to profitable rebandling. There are billions of tons of this gold-bearing sediment with which nothing can in all probability ever be done, except to use the alluvial bottoms that will ultimately be formed from it for agricultural purposes. There is a stretch of 40 miles of this stuff on Bear river, 20 or more on the main Yuba, and twice as much on Feather river and its tributaries, to say nothing of the American Fork and other streams, that is not likely to be further disturbed by the gold seeker, there being nowhere sufficient fall to run it off. In process of time, the richer portions of it may be lifted up with powerful steam dredgers, or other appliances, and passed through sluices, but for the present all this large amount of these slums may be counted out in estimating the quantity available for mining purposes. But after this abatement there remains still a good deal of this stuff that can be handled to advantage, this remainder embracing much the richest portion of it.

Beginning on the north the first considerable deposit of this auriferous debris met with occure in Plumas county, where it fills the channel of Slate creek for several miles to an average depth of 20 or 30 feet. As is the case at two or three other points, the tailings here have been estopped and kept from running off down stream by a rocky barrier, over which only the lighter and more worthless particles could escape except during floods, when much of the surface sand and gravel would also be swept away, leaving all save the extreme light films of gold behind. The cutting of a passage through this rocky barrier at the lower end of the deposit for a distance of a few hundred feet would afford an outlet through which the entire mass could be run off and precipitated down the steep canyon below. The entire expenditure required for cutting this passage, constructing flumes, sluices, undercurrents, etc., would not exceed $40,000 or $50,000. The cost of running a claim like this, once it were opened and outfitted, would be trifling, while the income could hardly fail to be large. That portion of these tailings that it would be necessary to command in order to inaugurate a successful operation here, is owned by a single company, who would convey a fair share of the property to parties willing to furnish enough money to put it in good working condition.

The next point at which we encounter these auriferous slums in great bulk, and under circumstances that admit of their easy utilization, is Bear river, in the main channel of which the quantity is estimated at 18,000,000 cubic yards, besides nearly twice as much lodged along its upper tributaries, making a total in this locality of 45,000,000 cubic yards at the least. The tailings here have gathered to an average depth of 50 feet, with a width of more than 200 feet along a linear stretch of 23 miles. It is calculated that they will yield from 30 to 60 cents to the cubic yard, or a total of $30,000,000 under a careful rewashing, this being aside from the value of the quicksilver and the sulphurets that they contain, and which may fairly be computed at several millions more. In order to move these Bear river tailings in a large way it will be necessary to construct a tunnel through the ridge that separates this stream from the North Fork of the American, a distance of nearly two miles. The heavy cost of a work of this kind has thus far prevented the enterprise from being carried out, though negotiations for the requisite funds have several times been nearly consummated, and failed only through extrinsic causes. That the project will find early execution we may safely conclude, in view of the splendid results that await its completion. A million dollars would more than suffice to build the tunnel and cover all other preliminary expenses, a sum hardly more than half the net revenues that might be expected to accrue every year after active operations were commenced.

Passing south to the Forest Hill divide, we come upon two very remarkable deposits of these tailings, the one resting in the channel of Indian and the other of Shirttail canyon. The former has recently been opened up and put in condition for working, and it is expected that the returns will be ample and remunerative. The latter, which belongs mostly to the estate of William C. Ralston, remains in the condition at which it was left at the time of his death, well prospected and partly opened up, but yielding nothing except to the predatory hordes of Chinese, who, attracted by the richness of the gravel, steal in and carry on rocker-washing whenever opportunity offers. That these people can make wages washing, by this inefficient means the poor surface dirt sufficiently attests the value of this material. This is, in fact, the richest, though not the largest body of gold-bearing debris in California. But there is enough of the stuff here for every practical purpose, the mass of it lying in this canyon being over 30 feet deep, 100 wide, and five or six miles in length. As on Slate creek, the tailings here are kept back by a rocky ledge at their lower end, and through which a passage must be cut for their escape. This would not be an expensive work, the total preparatory expenditure here being estimated at less than $40,000. It seems a pity that a property that could, with so little outlay, be speedily made largely and profitably productive, should be suffered to longer lie dead and neglected. It is indeed unaccountable that this mining debris has not everywhere been turned to better account, seeing how readily it can be worked, where it can be worked at all, and how sure are operations of this kind to bring large returns for the money invested. Although the field, owing to the causes mentioned, is contracted to a narrow limit, we can point the investor to nothing, in the whole range of our mineral resources, that promises better results than the rewashing of this wastage from the sluice and rocker of the early miner and the hydraulic operations of these later days.

No Cause for Alarm.

It is now pretty generally believed that the provisions of our new Constitution if fairly carried out will work no serious detriment to the mining interests of California. In this view none are now more ready to concur than the recognized friends of these interests, all of which claim that every department and branch of this industry will go on and prosper much as before. The claim that stock operations or any portion of them that legitimately belong here will be transferred to the East is repudiated on all hands. San Francisco will remain, as she has always been, headquarters for all important transactions, both speculative and practical. Nothing can divest her of her supremacy in the mining world or lessen the power which from this point has directed and energized nearly all the great mining movements on the coast. The machinery of the new Constitution may jar a little at first, but we will be able to so adjust the gearing that all will, in a little time, run smoothly. If through the instrumentality of the new charter or the laws made under it certain existing abuses shall find correction, so much the better, and if through like means some discouragements to stock gambling should be interposed, the fact would not be insupportable. In regard to the provision interdicting the stock sales on margins, it will be strange if dealers do not devise a method to evade any bad results.

In regard to the taxation of mining shares, these will of course be assessed at their actual and not at their nominal value. At the rate they are now selling, the value of all the mining shares listed on the stock boards of San Francisco would not exceed $45,000,000 or $50,000,000. Were they taxed 1% on their actual value, the amount would be less than half a million, a total that could hardly be considered ruinously oppressive. Estimated on the basis of their nominal value, these stocks would reach a valuation of three or four billion dollars, wherefore it is evident that no such rule for their assessment will be adopted.

MORE silver legislation is before Congress.

Lathe Tools for Working Standard Sizes.

Following the description of the American standard measuring machines and gauges, which we have given in the last two issues, comes the consideration of tools. In Mr. Richards' paper, before the Franklin Institute, are descriptions of some new designs by the American Standard Gauge and Tool Works, of Philadelphia, which we shall reproduce as follows:

The maintenance of standard sizes in a machine shop involves a good many things besides gauges, but fortunately nothing which should not be provided at any rate. Turning mandrels, for example, must be kept up to correspond. In former times turning mandrels were made of iron, consisting generally of scrap pieces of various lengths, and were usually turned off to fit each time they were used, and on the whole constituted what might be called a nuisance in a machine shop. Now it is evident that if holes are bored to uniform size, one mandrel of each size will do in a tolerably large shop, and if that mandrel is made of steel, hardened and ground to size, the expense of "maintaining it," as we may say, is reduced to a minimum.

The engraving, Fig. 1, shows a very good form for mandrels and drivers also. The ends are shaped with two polygonal sides, which fit into a corresponding seat in the driver, as seen in the end view. The driving studs, as shown on the smaller ones, are separate, and can be removed if not required.

Fig. 2, shows reamers for machine fitting, which can be expanded as they wear away. The smaller one is drilled out centrally, and then mortised between the blades, so that a conical plug forced in by the screw at the end expands the center of the reamer. The larger one is a blade reamer of the usual type, and needs no explanation.

Among the tools made at the gauge works, in Philadelphia, but in no way connected with gauging, are tool stocks with separate or detachable points, held by screw-keys in a very secure manner. A great many modifications of such tools have been tried in this country and also in Europe, but none except the present form seem to have met the expectations of their inventors.

In Figs. 3, 4 and 5, are shown side views of such tools, those for flat cutting having cylindrical cutters or points, a form not so commonly used here as in England, but having more endurance for heavy cutting than pointed tools. Tools of the kind shown in Figs. 3 and 4, are in general use at the Cornwall Iron Works, in Birmingham, England, where the expense of cutting and shaping iron, in so far as the writer can judge, has been reduced to its lowest limits.

The purposes arrived at in such tools are not always apparent at a first examination, and may be briefly mentioned as follows: (1) The points, being only small pieces can be made of finer steel than can be afforded for solid tools. (2) The points can be instantly removed or replaced without disturbing the tool stock. (3) The points being duplicates, no time need be lost in sharpening, a fresh point being inserted when necessary. (4) Tool dressing, an expensive and generally unsatisfactory branch, is dispensed with. (5) In grinding the tools a large number can be treated at one time; and there being but one grinding angle and that a constant one, no skill is required in the operation. (6) The hight of the point of the tool can be regulated at pleasure, thus avoiding what is called tool raising appliances on engine lathes.

The screw-cutting modification will be understood without further explanation, but it may be mentioned that in practice it has proved wholly successful.

The cylindrical point tools are modifications of quite an old invention, originating in Glasgow, and one of the examples shown is from England, where tools of this kind are gradually coming into use.

THE SOUTHERN PACIFIC.—The Southern Pacific railroad has suspended the work of extension on their road East till November or December next. It was the intention to stop when Maricopa was reached, but having more material on hand than was needed in carrying the construction to that point, contrary to expectation, the road has been prolonged some distance beyond, where it will now rest till the end of the year. There are many reasons for the suspension, not least among these being the impracticability of working in the hot summer season. The company are to be praised for the vigor and perseverance they have shown in pushing the road to its present termination in so short a time, and it is to be hoped that when building is resumed again the same activity as heretofore will prevail in pushing it forward to meet the Arizona Pacific or the Atchinson & Santa Fe road, and thus open up the southern portions of the State to direct communication with the Mississippi valley.

CHAS. M. PECK, Secretary of the Redington Quicksilver Mining Co., has absconded from San Francisco with $10,000 of the company's funds.

THE great pier and slip of the railroad ferry at Benicia are progressing, but will not be completed inside of three months.

CAUTION

To Hydraulic Miners.

The public generally and Hydraulic Miners especially are hereby notified that any parties making or using the contrivance known as the HOSKIN DEFLECTOR will be prosecuted to the full extent of the law, said machine having been declared by the U. S. Circuit Court an infringement upon my patent, the

Bloomfield Deflecting Nozzle.

The public are also cautioned against using the Hoskin Deflector because of its danger to life and limb, this device having already occasioned several deaths and other serious accidents. The BLOOMFIELD DEFLECTOR is entirely safe, its two and a half years use without accident, as well as its construction, proves it to be a reliable contrivance.

Any parties wishing to purchase the right to use these Deflectors can do so by applying to the undersigned,

HENRY C. PERKINS,

North Bloomfield, Nevada Co., Cal., October 1st, 1878.

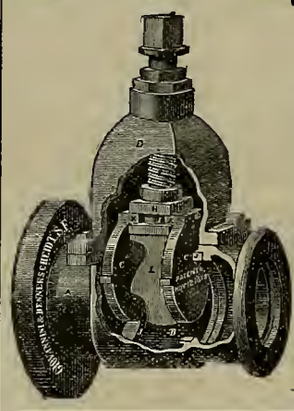
Room 24, Safe Deposit Building, Corner Montgomery and California Streets, SAN FRANCISCO.

Union Brass Foundry and Mechanical Work Shop.



GIOVANNINI & CO.,

417 and 419 Mission Strsst, - - SAN FRANCISCO.

The attention of our customers and especially of those interested in Water Works, Gas Works or Mines is respectfully called to our very important improvement in the construction of Stop Valves (or Gates). They differ from all others in that the inner faces are perfectly parallel, therefore when the Gate or Valve is to be opened, at the first movement of the screw the center block (see cut) releases the disks from their bearings, so that they will move easily and prevent the wearing of the inner faces.

This Gate has proved very efficient in Pipes of all sizes, and under any pressure and from its double form and perfect joint formation is especially valuable for use in large Pipes for water, steam and gas, and from its avoidance of any wedge shape cannot jam at any point (see cut).

The **G. & B. Valves** (or Gates) have no equal in simplicity of construction of all working parts, ease of access for repairs, and durability.

We have recently enlarged and fitted up our Brass Foundry and Shop with all the latest improved Tools and Machinery, thus greatly increasing our facilities for rapidly executing orders for all sizes of Stop Valves (or Gates) from three-inch to four feet in diameter, or any size, to order. We guarantee them to give better satisfaction, cost less money, and last longer than any other Valve in use.

We are also prepared to execute all orders in Brass Work for Breweries, Distilleries, Plumbers, Gas and Mining Apparatus, Ship Work, Soda Apparatus, Steam Fittings, Meters, Gauges and Indicators. Also in Machine Pattern and Model Making, and Clock Work. Gear cut to order. Brass Castings of all kinds. We are confident of our ability, and all orders entrusted to us will be executed with promptness and dispatch.

SAVE YOUR GOLD!

Highly Important to Miners and Quartz Mill Men!

SILVER PLATED AMALGAMATING PLATES.

The best process yet discovered for saving fine or float gold. Extensively used with great success in gravel and placer mining in various parts of the Pacific Coast. Over five hundred orders have been filled, and the demand is constantly increasing. A large number of these Plates were sent to Snake River mines, Idaho, last year, and a great many orders are being filled for them this season. Circulars containing full instructions for working these Plates sent with each order. Old Mining Plates bought or taken in exchange for new Silver Plated Plates, and full value allowed. Gold extracted from old Plates at a moderate cost by a new and economical process. Old Plates (which often contain a surplus of gold above the cost of plating) can be re-plated.

With the most extensive facilities on the Pacific Coast, orders can be filled very promptly and satisfaction guaranteed.

Mining Men and the public generally are cautioned against unprincipled and irresponsible parties traveling through the country, endeavoring to secure orders for very inferior qualities of Silver Plated Mining Plates.

Consulting Physician,

Professor of Phrenology and Mental Hygiene.

Proprietor of the Smithsonian Medical and Phrenological Institute, 635 California Street, above Kearny.

This Institute, by combining medical hygiene with the various Water Cure treatments and the most powerful Electrized Horseshoe Magnet in the world, claims to cure speedily and permanently all forms of acute or chronic nervo-vital derangements, Brain, Spinal and Heart diseases, St. Vitus Dance, Palsy, Epilepsy and all Rheumatic, Liver and Kidney troubles. The Institution has for the past 20 years made a specialty of treating all forms of weaknesses and diseases peculiar to males and females. By the use of hygienic remedies and electro-motorpathy the worst forms of impotency and seminal weakness in males and sterility in females are speedily and permanently overcome. Hygienic board, with or without rooms. Terms moderate. Electro-thermal, Russo-Turkish and Medicated Baths given daily.

Mrs. Dr. Smith as Matron has charge of the females bathing department.

DR. SMITH has practiced Phrenology the past 30 years, and during the last 20 years has been constantly using the sciences connected with Physiognomy, in examining or diagnosing disease in this city, and claims to have made discoveries in the SCIENCE of Phrenology that enables him, by an examination of the head, even blindfolded, to determine the disease to which the person is constitutionally subject, or whether the disease at the time afflicting the person, is the result of accident or hereditary weakness; whether CONSUMPTIVE, DYSPEPTIC, RHEUMATIC, APOPLECTIC, NEURALGIC, LEUCORRHŒAL, or SEMINAL. Especially does the form of the head indicate the strength of the uterine, genital or reproductive system. The head is also an index of the natural strength of the lungs, heart, stomach, liver, kidneys, spleen, back or vertebra, and it determines the power of the system in warding off and overcoming disease of all kinds.

Ladies or gentlemen, desirous of obtaining a thorough and correct Phrenological examinations with Fowler and Wells' charts, will meet with a respectful reception at his consulting rooms. Parties can depend upon a reliable delineation of the character of their intimate male or female friends, by presenting a clearly defined photograph.

Phrenological or Physiognomical examinations without charts, $1.50; with charts, from $2 to $3.

INVITATION TO INVALIDS

And all persons who are in any way out of health, who desire to know the nature and causes of their disease, may avail themselves of an examination through phrenology in regard to health free of charge, between the hours of 9 A. M. and 8 P. M. Sundays from 9 A. M. to 12 M.

Books for Miners and Millmen.

KUSTEL'S ROASTING OF GOLD AND SILVER ORES, and the extraction of their respective metals without quicksilver. Illustrated. 142 pages. 1870. A valuable and carefully written work. Postpaid, $2.50. Published and sold by Dewey & Co., S. F.

KUSTEL'S CONCENTRATION OF ORES (of all kinds), including the Chlorination Process for gold-bearing sulphurets, arseniurets, and gold and silver ores generally, with 120 lithographic diagrams. 1867. This work is unequaled by any other published embracing the subjects treated. Post-paid, $7.50. Printed and sold by Dewey & Co., S. F.

PHILLIPS' EXPLORERS, MINERS AND METALLURGISTS COMPANION, comprising a practical exposition of the various departments of exploration, mining, engineering, assaying and metallurgy. 482 pages and 83 illustrations. A most valuable and comprehensive book of reference to prospectors and practical miners. Post-paid, $10.50. Published and sold by Dewey & Co., S. F.

AARON'S TESTING AND WORKING SILVER ORES.—Illustrated. 111 pages. 1876. A useful and practical work, free from technicalities and extremely serviceable for miners' use. Post-paid, $2. Published and sold by Dewey & Co., S. F.

COPP'S HANDBOOK OF MINING LAWS.—Containing the U. S. Mining Laws, Digest of Decisions, Forms, etc. 1877. Pocket size and very handy and convenient for miners. Post-paid, $1. Sold by Dewey & Co., S. F.

Metallurgy and Ores.

Nevada Metallurgical Works,

No. 23 STEVENSON STREET,
Near First and Market Streets.

Ores worked by any process.
Ores sampled.
Assaying in all its branches.
Analysis of Ores, Minerals, Waters, etc.
Working tests made.
Plans furnished for the most suitable process for working Ores.
Special attention paid to Examinations of Mines; plans and reports furnished.

E. HUHN,
C. A. LUCKHARDT,
Mining Engineers and Metallurgists

JOHN TAYLOR & CO.,

Importers of and Dealers in
ASSAYERS' MATERIALS,
CHEMICAL APPARATUS AND CHEMICALS, DRUGGISTS' GLASSWARE AND SUNDRIES, Etc.
512 & 518 Washington St., San Francisco

We would call the special attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our stock of Clay Crucibles, Muffles, Dry Cups, etc., manufactured by the Patent Plumbago Crucible Co., of London, England, for which we have been made *Sole Agents for the Pacific Coast.* Circulars with prices will be sent upon application.
Also, to our large and well adapted stock of
Assayers' Materials & Chemical Apparatus,
Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast.
☞Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application.
JOHN TAYLOR & CO.

LEOPOLD KUH,

(Formerly of the U. S Branch Mint, S. F.)
Assayer and Metallurgical Chemist,
No. 611 COMMERCIAL STREET,
(Between Montgomery and Kearny,)
San Francisco, Cal.

OTTOKAR HOFMANN,

METALLURGIST and MINING ENGINEER,
415 Mission St., bet. First and Fremont Streets,
SAN FRANCISCO.
☞Erection of Leaching Works a Specialty.
☞Leaching Tests made.

The Miners' Assay Office,

N. E. Corner of the Plaza,
PRESCOTT, - - - - ARIZONA.
Assays of Silver, $1.50. Gold and Silver, $2. Other Ores at corresponding rates. All assays guaranteed.
Gold and Silver melted into Bars. Working Tests made.
☞Mines examined, sales negotiated, etc.
W. H. WILLISCRAFT,
P. O. Box 153. Prescott, Arizona.

THOS. PRICE'S

Assay Office and Chemical Laboratory,
524 Sacramento St., S. F.

G. F. Deetken. Wm. E. Smith.
PIONEER REDUCTION WORKS,

Channel Street, off foot of Fourth, San Francisco, Cal.
Highest price paid for Sulphurets, Arseniurets, Telluridcs and Gold Ores generally.
Careful attention paid to practical working tests on a large scale of Gold-bearing Quartz and ores of a refractory and sulphurcted nature.
Will examine, report on, and survey mining properties.

METALLURGICAL WORKS,

STRONG & CO., 10 Stevenson Street,
ORES SAMPLED, TESTED, ASSAYED.

GUIDO KUSTEL,

MINING ENGINEER and METALLURGIST.
P. O Address: ALAMEDA, CAL.

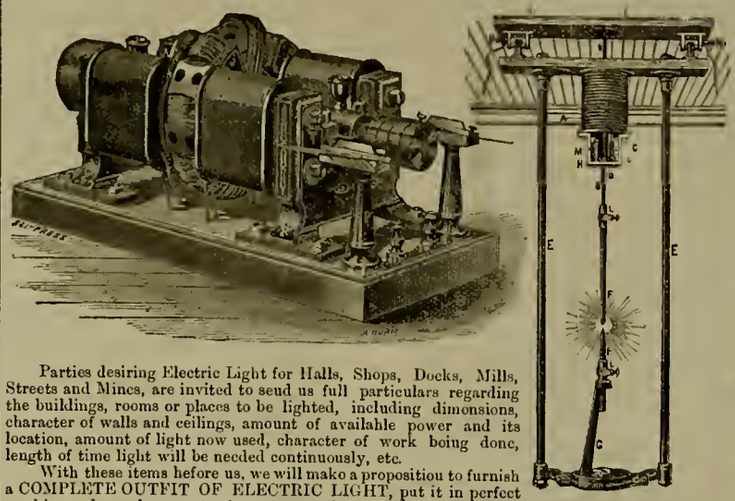
PACIFIC POWER CO.

Room with steam power to let in the Pacific Power Co.'s new brick building, Stevenson street, near Market. Elevator in building. Apply at the Company's office, 314 California street.

Patents OBTAINED IN U. S. AND FOREIGN COUNTRIES; trademarks, labels and copyrights registered through DEWEY & CO.'S Mining and Scientific Press Patent Agency, San Francisco. Send for free circular

ELECTRIC LIGHT.

BRUSH PATENT.
The Best, Cheapest, Cleanest, and Most Powerful Light in the World.
In daily use at the Palace Hotel and the Union Iron Works. S. F.



Parties desiring Electric Light for Halls, Shops, Docks, Mills, Streets and Mines, are invited to send us full particulars regarding the buildings, rooms or places to be lighted, including dimensions, character of walls and ceilings, amount of available power and its location, amount of light now used, character of work being done, length of time light will be needed continuously, etc.
With these items before us, we will make a proposition to furnish a COMPLETE OUTFIT OF ELECTRIC LIGHT, put it in perfect working order and guarantee its success and permanence. Address all communications,

S. F. TELEGRAPH SUPPLY CO.,
WM. KERR, President,
San Francisco, Cal.

Ingersoll Rock Drills.

In use in the largest and best Mines of the Coast.
HAS AUTOMATIC FEED.
Has less Repairs.
Is Lighter and more Easily Adjusted than any other Drill.
Our DRY AIR COMPRESSORS are the most Economical Compressors in the Market.

MINERS' HORSE-POWER.

This Power is especially adapted to working mines, hoisting coal or building material, etc. It will do the work of a Steam Engine with one-tenth the expense. One Horse can easily hoist over 1,000 pounds at a depth of 500 feet.
The Power is mainly built of wrought iron, and cannot be affected by exposure. The hoisting-drum is thrown out of gear by the lever, while the load is held in place with a brake by the man tending bucket. The frame of the Power is bolted to bed-timbers, thus avoiding all frame work. When required these Powers are made in sections for packing.

REYNOLDS, RIX & CO., 18 & 20 Fremont St., San Francisco.

SANDERSON BROS. & CO.'S

Best Refined Cast-Steel.

Warranted Most Superior for Drills, Hammers, Etc.

A full and complete stock of this reliable and well-known brand of Steel, for mining and other uses, now in stock and for sale

At No. 417 Market St., S. F., - H. D. Morris, Agent.

SHEET IRON PIPE.

FRANCIS SMITH & CO.,

Manufacturers of
THE PATENT CHANNEL IRON WHEELBARROWS.
THE STRONGEST BARROW MADE. These Barrows are made by Superior Workmen, and of the best material. All sizes kept constantly on hand.
SHEET IRON PIPE.
Lap-Welded Pipe, all Sizes, from Three to Six Inches. Artesian Well Pipe. Also, Galvanized Iron Boilers, from 25 to 100 Gallons.
Iron Cut, Punched, and Formed for making Pipe on ground, where required. All kinds of Tools supplied for making Pipes. Estimates given when required. Are prepared for coating all size of Pipes with a composition of Coal Tar and Asphaltum.
Office and Manufactory, 130 Beale Street, San Francisco.

SHEET IRON PIPE.

Machinery.

J. Thomson. C. H. Evans
THOMSON & EVANS,

(Successors to Thomson & Parker.)
Engineers and Machinists.

Rubber Suction HOSE Made to Order.

All Sizes of Gas and Tube FLANGES.

Steam Pumps, Steam Engines, Hoisting, Pumping, Quartz Mill, Mining, Saw Mill Machinery, Specialties.
Plans and Specifications for Machinery furnished. Repairing promptly attended to.
110 & 112 Beale St., San Francisco.

THE IMPROVED O'HARRA
CHLORIDIZING FURNACE.

Patented Sept. 10th, 1878.

Now in Operation at the Extra Mining Co.'s Works, Copper City, Shasta Co., Cal.

Two men and two cords of wood roast
Forty Tons of Ore in Twenty-four Hours,
Giving a full chlorination (100%) at a cost of 30 cents per ton. Address,
O'HARRA & FERGUSON,
Furnaceville, Shasta Co., Cal
Or CHAS. W. CRANE, Agent,
Room 10, Safe Deposit Building, San Francisco.

J. S. PHILLIPS, M. E.,
Consulting Engineer & Metallurgist,
Examiner of Mines and Assayer,
702 CALIFORNIA STREET,
Author of— San Francisco.

The Explorers', Miners' and Metallurgists' Companion, 672 pages, 83 Illustrations, (2d Edition.) Price	$ 10 50
The Prospector's "Wee Pet" Assayer, (Patented)	100 00
The Testing Machine for Gold, Silver, Lead, etc.	40 00
The "Little Wonder" Self-calculating Sample and Button Weigher, (Patented)	25 00
Blow-pipists' Pocket Laboratory of Tools, Fluxes, etc.	50 00
Vest Pocket Blowpipe	3 00

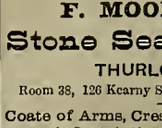
CHARGES.—Assaying, $3; Testing, $2 per metal.
Assaying and Testing Taught.

WANTED—$10,000.

For $10,000 cash in hand I will give a one-half interest in the BLUE JAY and ELEPHANT QUARTZ mines, situated in the French Creek Mining District, Siskiyou County, Cal. And I will take or give a lease on said mines, and pay or receive eight per cent. on the amount invested. For further particulars apply to H. C. Cory, Etna Mills, Siskiyou County, California.

San Francisco Pioneer Screen Works

J. W. Quick, Manufacturer,



Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.
32 Fremont Street, San Francisco.

F. MOORECROFT,
Stone Seal Engraver,
THURLOW BLOCK,
Room 38, 126 Kearny St., Cor. Sutter, San Francisco.
Coats of Arms, Crests, Monograms and Masonic Inscriptions Carefully Engraved.

Dewey & Co {202 Sansome St.} Patent Ag'ts

Continued from page 333.

CROWN POINT.—The winze is within 10 ft of the 2700 level. The north drift, 2500 level, is making 40 per week outside the ledge.

WARD.—The shaft is being extended on down as usual, and is now 1445 ft deep. The material has changed of late, and become much harder and carries less water.

HALE & NORCROSS.—The east drift, 1620 level, has been in short, tough and bad-working ground, but has got through it into that which admits of better progress again.

JULIA CON.—The work of repairing the south drift, 2000 level, has been continued as usual. The heat in the mine is very oppressive and hinders operations.

UTAH.—The incline is making usual progress, the bottom 520 ft on the slope below the 1350 station, and in good sinking ground. The flow of water is light

SAVAGE.—Retimbering the incline and repairing the north drift, 1600 level. Repairs to the 1600 bob-pit have been completed.

MEXICAN.—By the 1st of June the joint incline winze from the 1600 level will be connected with the upraise from the 2000 level.

YELLOW JACKET.—The new shaft is 2540 ft deep. The drift on the 2500 level is in 66 ft.

ANDES.—The new upraise from the 350 level is up 50 ft. Prospecting from the former upraise has been commenced.

SUTRO TUNNEL.—Working between 1,200 and 1,300 men, including about 100 carpenters constructing the box for the sub-drain,

CON. VIRGINIA.—The yield of the mine is being increased. The joint California drift west on the 850 level is still in hard porphyry, its face 135 ft from the shaft. Joint California west crosscut No. 1, on the 1850 level is now in 44 ft, and has its face still in quartz giving low assays.

LEVIATHAN.—The face of the north lateral drift, on the 750 level, has shown considerable improvement, more quartz and low-grade ore coming in. The ground is still very hard, but growing softer.

SILVER HILL.—The work of creating a sump for 1300 level of the incline is going on. The drift north, 1100 level, is averaging five ft per day.

TROJAN.—Work has been going on through the week from the 2d and 3d stations as usual, and is making good progress.

LADY BRYAN.—Sinking the sump below the 750 level and drifting north and south on the 600 level. The face of the south drift is in quartz, and the north drift is between two bodies of quartz,

OVERMAN.—The work of putting the drain in the north drift, 1600 level, has been completed and work in the face resumed.

NEW YORK.—The work of extending the incline below the 1200 level is making usual progress. The new incline engine works perfectly.

CALEDONIA.—The blower has been placed in the drift, 1600 level, and sinking resumed in the winze below that level.

MT. HOOD & VANCOUVER.—The drift on the 1400 level has been sent 190 ft toward the ledge.

BELMONT DISTRICT.

BELMONT.—*Courier*, May 17: The work of development below the 300 level has been continued without interruption during the past week with good results, showing the ore body much larger than expected. In the 300 level drift running from shaft, they have two and a half ft of vein matter and quartz, all of which assays from $10 to $25 per ton. They are now about under the Transylvania ground, with this drift, in which was found a fine body of ore near the surface, and as there has been no prospecting done in this part of the mine below the old incline water level, they feel confident of finding a body of ore. The bad air has stopped work in the drift running from south raise, but they will make the connection before the end of the coming week.

HIGHBRIDGE.—They have cut across the ledge 140 ft south of shaft. At this point it is 12 ft wide, solid and carrying some good ore, and indicates being close to the ore chimney they expect to find on this level. It will take about 10 days to extend the crosscut across the ledge 70 ft from shaft. Other work progressing as usual.

EUREKA DISTRICT.

EUREKA CON.—*Sentinel*, May 18: The following work has been done in the several levels without any change to report: Fifth level—East drift has been continued 22 ft, and is now in 86 ft. Seventh level—Northwest drift has been continued 16 ft, and is now in 40 ft. Started drift running southwest and continued the same 50 ft. Thirteenth level—East drift has been continued 18 ft, and is now in 58 ft; the west drift has been continued 17 ft, and is now in 64 ft. The incline has been sunk 20 ft, and is now 84 ft below the station.

FOURTH OF JULY.—The developments in the mine of late have been of the most favorable character. The vein of ore found in the bottom and north end of the cave, 50 ft above the lower tunnel level, has materially improved, both in size and quality of the ore. They have now at the Richmond furnace 30 tons of first-class ore, which was sampled and paid for on the 13th inst.

HAMBURG.—East crosscut from south drift, 600 level, has been advanced 10 ft, making a total of 48 ft; the face in the same favorable vein matter, with a seam of good ore to follow. In drifting south from end of west crosscut, 600 level, the quartzite gave out. They are now continuing west crosscut, which is in very lively vein matter. Above 250 level they are getting a considerable amount of first-class ore. They have commenced shipping ore to the Richmond furnace. Will have samples taken and assays made during the coming week.

PARADISE DISTRICT.

STREET & BLANCHE.—Paradise *Reporter*, May 17: This is a tunnel-right claim, and is being prospected by a three-shift force of two men to the shift. The main tunnel is in about 200 ft, and is being pushed ahead at the rate of three ft every 24 hours. The prospect for striking something very rich and deep is very good, as several prominent ledges crop boldly across the course of the tunnel. The owners are doing their own work.

NOTES.—Work has been commenced on the lower tunnel of the Mammoth mine. About 10 ft of tunnel has been made, and in less than eight ft more will strike the winze from the upper drift. The force of miners is light at present, but will be increased as the mine is opened. Capt. Elliott has just received advices from Quin River, Rebel Creek district, informing him that Harpel & Co. have just struck the south extension of the Ohio ledge. Sufficient opening, however, had not been made to give particulars. The Willow Creek mining district promises to be a lively camp very soon. On the Ethan Allen a tunnel has been started on the ledge, and is now in about 15 ft. Several tons of ore, averaging $150 in silver per ton, have been piled on the dump. The course of the ledge is northeast and southwest, and the croppings for several thousand ft are from 15 to 50 ft wide. Messrs. Chittick & Wright have taken a contract to run a 50-ft tunnel on the ledge, with the privilege of continuing the work as long as both parties can agree. The mine is owned by Messrs. Williams, Adams and Burbank.

IDAHO.

NORTHWESTERN COMPANY.—Phillipsburg Cor. *New Northwest*, May 9: The mill is running steadily on Trout and Murray & Durfee ore. The output of bullion is fair and above average. Roasters chloridizing 10 tons per day. Sinking the Trout shaft is making steady progress. Bottom in hard blasting ground. A station is being put in and a level already started at a depth of 400 ft. This vein will tap the drift in 12 ft, and the ore chimney 100 ft from the shaft. A large amount of high-grade ore will then be ready for stoping between this and the 311 level. The ore stopes above 311 level wherever they are worked yield well. The mine presents the general characteristics of a true fissure vein. Walls, well defined, running east and west, the course of the lode is regularly dipping to the north, and about 75° from the horizon. The ores are argentiferous blende and native silver, with an occasional beautiful wire silver in quartz crystallization. The mine is thoroughly opened and worked systematically and economically.

ALGONQUIN.—The upraise from the 290 level, running east, on the hanging wall, has been stoped out and timbered to the 200 level. No change in character of ore or width of vein. A continuation of the stope to connect this upraise with the water level is being pushed ahead with dispatch. Face of stope in lime and dolomite, requiring heavy blasting. The west drift on the 250 level is in 40 ft from the crosscut; ground very soft and broken; water increasing daily. The face shows eight ft of vein matter, very promising in appearance, with a vein of ore 16 inches in width next to the walls. No output of ore; all work is exploration. Mr. Fisher has a large force of men on the Frost gulch road, and will commence excavating for the mill site.

The Mechanics' Fair.

The Fair Board of Managers of the Mechanics' Institute have already made preparations for the Fourteenth Industrial exhibition which, according to a resolution of the board adopted last year, is to open on the 5th of August next and close on the 5th of September. It is fully believed that the exhibition will be a grand success.

The board publish a circular for distribution, setting forth that "the great Overland excursion of 15,000 or 20,000 persons that is coming from the Eastern States to meet Gen. U. S. Grant on his arrival in this city in August next, will, no doubt, induce an unusual number of the people of this coast to visit the city at that time; and it is certain that anything placed on exhibition will be seen and examined by many more than usual, and by representatives of every great industry and improvement of the age."

It is to be hoped that all our mechanics and manufacturers will lend their aid to advance the interests of the exhibition and endeavor to make as fine displays of their products or specialties as possible.

The art gallery will be in charge of the San Francisco Art Association, as it was last year. Exhibitors will be given space and a reasonable amount of power and water free of expense. Following is a list of the managers: Irving M. Scott, J. A. Bauer, A. L. Fish, James Drury, Samuel Dinsmore, Isidor Burns, A. W. Starbird, D. A. McDonald, S. H. Wheeler, C. Waterhouse, Nathaniel Hunter, David Kerr, Edward McGrath, F. A. Frank.

The Secretary, J. H. Culver, has issued the following rules and regulations of the exhibition:

The building will be open for the reception of goods Monday, July 21st, 1879.

Application for space should be made on or before July 19th.

Motive power, steam and water will be supplied without cost, and the managers most earnestly desire all exhibitors of machinery to have the same in motion whenever practicable, as thereby the benefit of exhibiting, and the interest of visitors will be greatly increased.

No charge of any kind will be made to exhibitors for space.

Space will be awarded as early as practicable (after application for space has been received), consistent with proper arrangement of goods.

Articles arriving early will be stored free of charge to the exhibitor, and if not consigned to an agent, they will be properly placed on exhibition, but no freight charges will be paid by the managers.

The Board reserve the right to exclude from the exhibition anything they deem objectionable; as nostrums, articles of an explosive, inflammable, damaging or offensive character.

CRANSTON'S HYDRAULIC GRAVEL ELEVATOR.—The Cranston elevator is a device for raising gravel from mines by means of water, in localities where there is not proper fall for the gravel to be removed in the usual way. The device was gotten up a few years ago, and when introduced, few people thought it would work satisfactorily. Notwithstanding this, several machines are at work. At Wyandotte, Butte county, a 16-inch machine has been successfully running for over a year. There is also one at Columbia, Tuolumne county; a 12-inch one at the Layard mine, in Placer county; a 16-inch one lifting 29 feet on Ohio Flat, in Yuba county, etc. We gave a detailed description of the machine in the PRESS about a year since. One has recently been set up at Waldo, Josephine county, Oregon, and the owner of the claim writes to the inventor as follows about it: "I started the machine last week, and it is a complete success and the admiration of all who have seen it. It works fully as well as represented. I am raising heavy gravel 29 feet 9 inches, and can raise 12 or 15 feet more when necessary. I had not a bit of trouble with the machine, as it went off from the 'word go.' I am driving it with 315 feet of pressure, using a 2½-inch nozzle which discharges 154 inches of water, but I think a 2 or 2½-inch nozzle will do. When the excitement is over I will try the experiment so as to give me more water in the mine. That machine of yours has caused more excitement here and more talk than a presidential election. There was a certain class of people around here expecting to have a good laugh over it, but they had to do it backward, and acknowledge that the machine works first-rate." (Signed) Y. B. Desselles. Joshua Hendy, corner Mission and Fremont streets, is the agent for the manufacture and sale of these machines.

UNLESS the home government helps Canada to finish the intercolonial railroad the project will be indefinitely postponed.

News in Brief.

ALL is quiet in Alaska.

GENERAL disorder reigns in India.

THERE are over 20 saloons in Sutro.

ELKO wants rain to save its hay crop.

CHICAGO has suffered from a large fire.

CROPS on Union island appear remarkably well.

THE tanneries at Benicia are virtually shut down.

THE miners strike at Durham (Eng.) has ended.

SHIP-BUILDING in South San Francisco is brisk.

THE *Jamestown* has started for Sitka, as per orders.

FROST is destroying fruit in some parts of Oregon.

A HEAVY fall of snow occurred in Shasta on the 19th.

THE Central American revolution is gradually subsiding.

VESUVIUS has been in a state of agitation for some time.

NEW powder works are shortly to be erected at Berkeley.

ANOTHER great strike of colliers is threatened in England.

CROP prospects in all portions of the south are promising.

TWENTY-FOUR Nevada mills are at work on Black Hills ore.

DIPHTHERIA is prevalent at Sutter Creek Amador county.

THE weather is very hot in New England—100° in the shade.

A CONFEDERATE monument has been unveiled at Columbia, S. C.

SCHOONERS now cross the Coos bay bar without the aid of tugs.

THE Indian supposed to have murdered Paul Reiger is in custody.

GENERAL SUTTER is living at Litiz, Penn., in comparative poverty.

NEVER has agriculture been so profitless in England as at present.

THE Santa Barbara county wheat crop will be very large this year.

GERMAN towns are opposed to the proposed duties on corn and cattle.

THE Southern Pacific has decided to suspend work till next November.

OATS are heading out and fruit looking well in Douglass county, Oregon.

THIRTEEN cars and two engines were lately ditched near Verdi, Nevada.

INTERESTING fossil remains have been found during excavations in London.

SENATOR SLATER will soon introduce another Anti-Chinese bill into Congress.

CAPITAL punishment has been re-established in Switzerland by popular vote.

AN excellent sandstone quarry has been discovered at Boisefort, Oregon.

THE town of Halas, Hungary, is inundated and much damage has been done.

THE Washington (Yolo) cannery is putting up salmon at the rate of 1,000 a day.

Elkin's Amalgamator.

We examined one day this week the Elkin's "Boss Amalgamator," which is on exhibition and running in the basement at the northeast corner of Liedesdorff and Pine streets. It is very simple in construction. The machinery is supported by a frame so arranged that it can be taken apart and tied in bundles for convenient transportation, no part weighing over 150 pounds, the whole machine weighing about 500 pounds. On the frame is a long iron hopper, (into which all material may be sluiced or shoveled), in the bottom of which is a screw conveyor for feeding and measuring all material to be treated. At the lower end of this hopper is a shaking screen through which all material must pass, that separates all course particles, preventing their passing through the machine. From the screen it drops into a hopper on the upper end of a three-inch iron pipe, through which all material passes into the quicksilver chamber at the lower end of a cone-shaped cast-iron cylinder. It then passes through from three to four inches of quicksilver, and is forced by water up to the top of the cylinder through the overflow pipe and off. While passing from the quicksilver chamber it is met by a counter current of fine sprays of water, forced from a series of perforated hollow revolving arms, that washes and settles all fine or flour gold and quicksilver—thus preventing all loss of quicksilver and precious metals. At the extreme lower end of the large cone-shaped cylinder is the amalgam chamber or safe, which is always kept securely locked, thus preventing all loss by waste or dishonesty. Any ordinarily intelligent man can operate this machine after very little instruction, as successfully as the most skilled millman. It can be seen in operation at the address given above.

Bullion Shipments.

Since our last issue, we have noticed the following bullion shipments:

Hillside, from May 14th to May 20th, inclusive, $20,340; Northern Belle, May 12th, $2,825.72; Martin White, from May 11th to May 18th, inclusive, $16,867; Paradise Valley, May 13th, $7,682.62; Standard, May 17th, $18,209.28; Bulwer, May 17th, $17,188.75.

New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office at San Francisco:

NELSON O. & S. M. Co.—Object: To operate in Plumas county. Capital, $10,000,000. Directors—Archibald Borland, August Hemme, Robert N. Graves, Thaddeus B. Kent and Hermann F. Morken.

FOULK G. & S. M. Co.—Object: To operate in Mono county. Directors—G. W. Orayson, C. A. Burgess, A. H. Rutherford, T. Bell and C. X. Hobbs.

SILVER PEAK TUNNEL & M. Co.—Directors—Frank Doutrick, W. H. Clark, P. Edward Connor, E. N. Robinson and W. W. Bishop.

ORIENT PLACER G. M. Co.—Object: To operate in Sierra county. Capital, $100,000. Directors—Henry D. Dahnecke, John German, George N. Powell, Peter Schaffer and R. C. Standinger.

ALCHEMIST M. Co.—Object: To operate in Calaveras and Tuolumne counties. Capital, $1,000. Directors—Charles W. Otis, Allen Deetb, James Stratton, John W. Still and Jonathan Myers.

SILVER BRICK CON. M. Co.—Capital, $10,000,000. Directors—Francis Cutting, Samuel L. Stanley, E. B. Pond, Samuel Linkton and Hiram Crowell.

Printing Inks.

The people who read the newspapers, magazines, and printed matter generally of the day, have their attention called to the typographical clearness, neatness and perfection they display. And fewer still know that the excellence and superiority of the work is to a large extent regulated by the nature and quality of the ink used in the printing of it. It is a fact, however, for though the presses used be of the most improved patterns, the type and wood cuts fine and clearly cut, the paper heavy and of the best quality, and the printer lavish of his care and skill, yet if the ink be of inferior kind the attempt at good work will invariably go for nothing.

Printing ink is a preparation very different from any of the inks used for other purposes, and calls for no little attention and skill in its manufacture. It should be soft and adhesive, readily attaching itself to the surface of the type, and as easily transferred to the paper pressed upon them. It should dry quickly, and at the same time not be easily removable from the paper by mechanical means. To the eye, good printing ink appears glossy and somewhat oily. Its texture should be without grains, and its tenacity such that it will leave but a short thread attached to a portion drawn out. The principal ingredients used in its manufacture are resin, linseed oil, lamp-black and other coloring matters.

The inks are made of all qualities to suit the demands. Cheap inks are a necessity, for printers cannot afford to do cheap work with costly materials, and many advertisers prefer to do more advertising in this cheap way than to pay for the cost attendant on more elaborate productions. After repeated tests we have settled down to the almost exclusive use of inks manufactured by Chas. Eneu Johnson & Co., of Philadelphia and New York. This firm manufactures every kind of ink, making a specialty, however, of first-class inks. Their inks are well known and largely used in all the States. We have long used ink supplied by this firm at reasonable prices, and our present issue illustrates satisfactorily its quality and character. It is emphatically a good ink and well calculated to give satisfaction. One special recommendation for all kinds of Johnson's inks, is their permanency and uniformity of quality. All good pressmen know the difficulty, or we may say impossibility of producing good printing continuously with any brand of ink which varies from time to time in quality, is "capricious," or "balky," as damaging results are bound to follow and vex himself as well as the authors and publishers of the works he prints.

FRESH attractions are constantly added to **Woodward's Gardens**, among which is Prof. Gruber's great educator, the Zoographicon. Each department increases daily, and the Pavilion performances are more popular than ever. All new novelties find a place at this wonderful resort. Prices remain as usual.

EXAMINE the accelerative endowment plan, as originated by the Mutual Benefit Life Insurance Co., of Newark, New Jersey. Assets, $30,533,429.94. Lewis C. Grover, President; L. Spencer Coble, Vice-President; Benjamin C. Miller, Treasurer; Edward A. Strong, Secretary; Bloomfield J. Miller, Actuary. Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

Rocky Point Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Placer county, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the 17th day of April, 1879, an assessment (No. 1) of ten (10) cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin to the Secretary, at the office of the Company, No. 314 Bush street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the 29th day of May, 1879, will be delinquent, and advertised for sale at auction; and unless payment is made before, will be sold on Monday, the 16th day of June, 1879, to pay the delinquent assessment, together with cost of advertising and expenses of sale. By order of the Board of Directors.

T. L. BIBBINS, Secretary.

Office, 314 Bush Street, San Francisco, Cal.

Mount Jefferson Milling and Mining Company.—Location of principal place of business, San Francisco, California. Location of works, Garrote Mining District, Tuolumne county, California.

NOTICE.—There is delinquent upon the following described stock, on account of assessment (No. 6) levied on the 21st day of March, A. D., 1870, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amt.
Condee, G M, Trustee	32	3000	150 00
Condee, G M, Trustee for the Mount Jefferson M & M Co.	44	800	40 00
Condee, G M, Trustee for the Mount Jefferson M & M Co.	43	2000	100 00
Condee, G M, Trustee for the Mount Jefferson M & M Co.	40	2000	100 00
Condee, G M, Trustee for the Mount Jefferson M & M Co.	50	2000	100 00
Condee, G M, Trustee for the Mount Jefferson M & M Co.	51	2000	100 00
Condee, G M, Trustee for the Mount Jefferson M & M Co.	54	1000	50 00
Condee, G M, Trustee for the Mount Jefferson M & M Co.	55	1000	50 00
Condee, G M, Trustee for the Mount Jefferson M & M Co.	58	11080	554 00
Fassett, N C	21	500	25 00
Fassett, N C	20	1000	50 00
Fassett, N C	22	500	25 00
Fassett, N C, Trustee	7	500	25 00
Fassett, N C, Trustee	8	500	25 00
Smith, O, Trustee	40	1000	50 00
Smith, O, Trustee	41	500	25 00
Smith, O, Trustee	42	500	25 00

And in accordance with law, and an order of the Board of Directors made on the 21st day of March, 1879, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the Company, on Tuesday, the 27th day of May, 1879, at the hour of three o'clock P. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of the sale.

R. N. VAN BRUNT, Secretary.

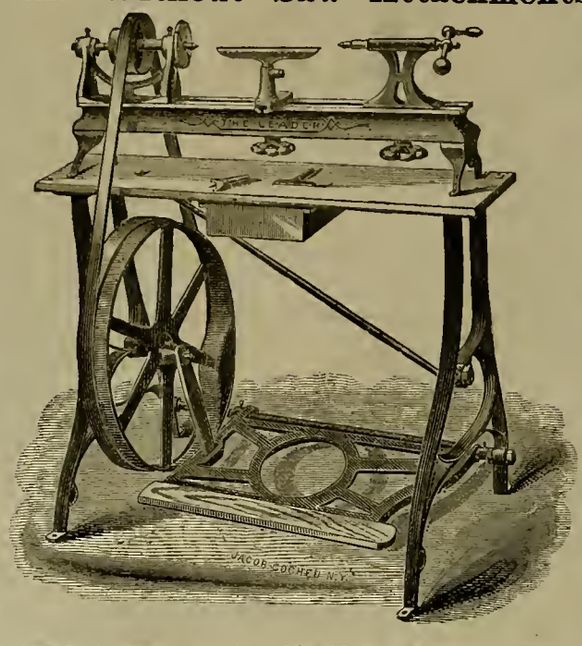
Lathe Without Saw Attachments.



This Lathe has been made especially to meet a want felt by many for a really good and substantially made Foot-Lathe at a reasonable price, and we think that we can safely say that it is by far the best Lathe ever placed on the market at the price asked. The bed, head and tail stocks are of Iron; the spindles of steel. The bearings of the head stock is conical, so that the wear can be easily taken up.

Material eighteen inches long and eight inches in diameter can be turned on it. The pieces that accompany this Lathe without extra charge are two T rests, two plain centers, one spur center for wood turning, and one face-plate.

Price of Lathe without Saw Attachments.....$45. Price of Lathe WITH SCROLL Saw Attachment.....$55.
Price of Lathe with both Scroll and Circular Saws, $70.

Trump Drill Chuck.

Chuck, for drills ⅛ and under, Price.....$1.50
Chuck, for drills ¼ and under, Price.....$2.25

They are made on solid steel plug, centered and *readily fitted to Lathe or Drill Press.*

NOTICE

TO THE

MINING PUBLIC.

MESSRS. RANKIN, BRAYTON & CO., of the Pacific Iron Works, are the only parties authorized to manufacture HOWELL'S IMPROVED WHITE FURNACE under the Licenee of thie Company.

THE STETEFELDT FURNACE CO.,

By C. A. STETEFELDT, President.

Referring to the above, the undersigned would call attention to the fact that by a compromise recently effected with the STETEFELDT FURNACE COMPANY, they have secured the use of all the patents of said Company applying to

Revolving Cylinder Furnaces,

And are thus enabled to give purchasers the license of all patent claimants, to-wit:

WHITE, HOWELL, THOMPSON,

— AND THE —

Stetefeldt Furnace Company,

Thereby avoiding all further litigation in reference to these rival claims. The great

SUPERIORITY OF THE FURNACES

Embracing these patents has been satisfactorily demonstrated. There are now some thirty of them in operation in the various mining districts of the coast, operating in all cases with economy and satisfaction, working in many localities

THE BASEST AND MOST REFRACTORY ORES UP TO 90 AND 95 PER CENT.

By an improvement—the patent for which has recently been allowed—this Furnace can be readily adjusted so as to work with equal facility and effectiveness all classes of ores.

The following are some of the Mining Companies who have recently adopted this Furnace, the most of which are now in successful operation, many of them running two and some three and four Furnaces.

NEVADA.—Grand Prize, Star, Martin White, Highbridge, Columbia, Alexander, Paradiso Valley, Jefferson, Leopard, Eagle, Endowment, Independence.
ARIZONA.—Tiptop, Tiger, Pock, Hackberry, Corbin, Tombstone, Bradshaw.
OREGON—Monumental.
MONTANA—Alice Mine, Butte City.
MEXICO—Trinidad, Harmiguera, Plomoses.
PERU—Cerro de Dasco.

RANKIN, BRAYTON & CO.,

Pacific Iron Works.

CAUTION.—All persons are hereby cautioned against buying from other parties Furnaces embracing the improvements covered by the patents above mentioned as they will be vigorously prosecuted and involved in heavy damages.

NO. 7 IMPROVED

AIR COMPRESSOR.

SPECIAL ADVANTAGES.

Absolute certainty in the action of the valves at any speed. Perfect delivery of the air at any speed or pressure. The heating of the air entirely prevented at any pressure. Takes less water to cool the air than any other Compressor.

Power applied to the best advantage. Access obtainable to all the valves by removing air chest covers. Entire absence of springs or friction to open or shut the valves. No valve stems to break and drop inside of cylinders.

Have no back or front heads to break. The only Machine that makes a perfect diagram. No expensive foundations required. Absolute economy in first cost and after working.

DISPLACEMENTS in air cylinder perfect. Showing less leakage and friction than our competitors and a superior economy of about 20 per cent.

Small Sizes made in Sections not to Exceed 300 lbs.

HERCULES SLAYING THE GIANTS.

HERCULES POWDER

Derives its name from HERCULES, the most famous hero of Greek Mythology, who was gifted with superhuman strength. On one occasion he slew several giants who opposed him, and with one blow of his club broke a high mountain from summit to base.

HERCULES POWDER will break more rock, is stronger, safer and better than any other Explosive in use, and is the only Nitro-Glycerine Powder chemically compounded to neutralize the poisonous fumes, notwithstanding bombastic and pretentious claims by others.

No. 1 (XX) is the Strongest Explosive Known.

No. 2 is superior to any powder of that grade

CARTRIDGE.

GEN. W. S. ROSECRANS, President.

COL. SAM'L. O. GREGORY, Secretary.

Fuse Lighter and Fuse.

Safety Cap and Fuse.

Electric Cap.

Safety Powder, Caps, Electric Caps, and Fuse Lighters.

Under a series of U. S. Patents, after long and carefully conducted experiments and thousands of tests, this Company is prepared to manufacture and supply, for Mining and Engineering Works, the above named articles at prices and on terms as favorable as articles of similar grades are now supplied in this market. Our Powders contain no Nitro-glyceriue, no Nitroline, no Gun Cotton, no Fulminates, and are free from the unavoidable dangers in manufacturing transporting, handling and using of all high grade explosives which contain those elements.

Cold does not affect them. They cause no headaches or other inconveniences in handling, and the smoke from their explosion contains no poisoning or sickening vapors.

Their blasting force, with slight tamping, at least equals that of any Powders now used, but they admit and require strong tamping to bring out their immense and peculiar lifting power which follows their detonating work. They should be fired, therefore, by our

Safety Cap,

Which allows tamping without danger. They can be fired by any caps now employed in blasting, but the use of these is always dangerous with any Powder, and the loss of the throwing power resulting from lack of tamping renders it with our Powders doubly objectionable.

Our SAFETY CAPS have twice or thrice the force of triple Giant Caps. When set on fire they do not explode, but merely burn off, and are perfectly safe in transporting and in tamping.

In round tin boxes, 50 cents.

The Safety Fuse Lighter,

Cheap, handy and sure to light the Fuse upon the end of which it is fastened, only needs a trial to be appreciated by every miner who is up to "snuffs." 25 Cents per box; sent by mail.

Safety Fuse,

Equal to the best in the market, will be supplied at the lowest market prices.

In consequence of spurious imitations of

LEA AND PERRINS' SAUCE,

which are calculated to deceive the Public, Lea and Perrins have adopted A NEW LABEL, bearing their Signature, thus,

Lea & Perrins

which is placed on every bottle of WORCESTERSHIRE SAUCE, and without which none is genuine.

Ask for LEA & PERRINS' Sauce, and see Name on Wrapper, Label, Bottle and Stopper. Wholesale and for Export by the Proprietors, Worcester; Crosse and Blackwell, London, &c., &c.; and by Grocers and Oilmen throughout the World.

To be obtained of CROSS & CO., San Francisco.

THE AMERICAN

All sizes, and adapted to from 3 to 500 feet head

TURBINE Water Wheels

THE BEST IN THE WORLD!

Send for our Circular and Prices.

BERRY & PLACE.

Market St., Head of Front, San Francisco.

Imperial Parchment LINEN WRITING PAPERS

For Foreign and Mercantile Correspondence, and Legal use.

Handsomely put up in quarter ream boxes, and Envelopes to match. Notes, Letters, Letterheads, Legal Cap and Abstract Legal.

For Sale by all Stationers.

H. S. CROCKER & CO., GENL. AGTS.

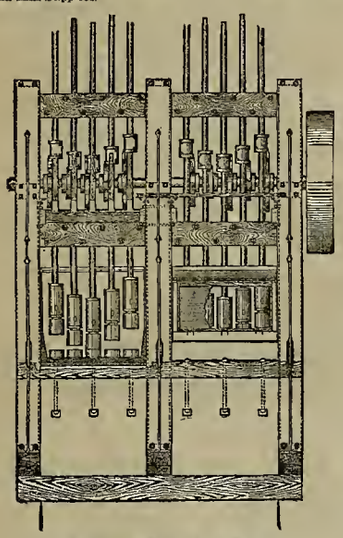
LAND Good land that will raise a crop every year. Over 14,000 acres for sale in lots to suit. Climate healthy. No drouths, bad floods, nor malaria. Wood and water convenient. U. S. Title, perfect. Send stamp for illustrated circular, to EDWARD FRISBIE, Proprietor of Reading Ranch, Anderson, Shasta County, Cal.

GOLD AND SILVER

Grinding and Amalgamating

MACHINERY.

Stamp Mills, Rock Breakers, Crushing Rolls, Amalgamating Pans and Separators for Gold and Silver Ores, Chlorodizing Furnaces, Retorts, Rock Drills, Air Compressors, Steel Shoes and Dies for Stamps, and every description of Mine and Mill Supplies.



SPERRY'S

Wrought-Iron Frame

FOR STAMP MILLS.

Great saving in time and money over the wood frame. Is made complete with wrought-iron frame ready to put upon the foundation, requiring no skilled millwright. These mills are unsurpassed in excellence in every particular.

We are furnishing all the Machinery for a 10-Stamp Gold Mill, including Crucible, Steel Shoes and Dies, Boiler and Engine, Counter Shafting, Pulleys, etc., Stamps weighing 450 lbs. each, with Copper Plate inside of the Mortars, and for tables outside, making all the Machinery complete for a 10-Stamp Mill for the sum of

$2,250.

We construct Mills with Stamps weighing from 350 to 900 lbs. for gold r Silver Ores. Wet or dry Crushing Mortars. Will contract to erect complete Gold and Silver Mills on the most improved plans. We have 30 years' experience in mining and milling Gold and Silver Ores, and can compete with the world. Send for a circular. Address

MOREY & SPERRY,

No. 145 Broadway, - - NEW YORK.

GARDNERS'

Celebrated

Governor

These Steam Governors have long been known as THE BEST, and as lately Improved and Perfected, they have no Rival.

THE SAFETY STOP

On these Governors is alone worth double the price of the Governor. We have sold over six hundred, and

Never one has Failed.

They are sold at the same price (or less) as ordinary Governors. Send for Circular.

BERRY & PLACE,

Market, head of Front St., San Francisco

C. C. Bitner's Apparatus for Obtaining Metallic Copper from its Solutions.

Patented March 18th, 1879. Will precipitate with steam in three hours, requiring no machinery to run it. Cost of constructing apparatus, $75. The old cylinder process takes four hours to precipitate and costs from $1,200 to $1,500 to construct, besides the machinery to run it. For right to use my Precipitator address C. C. BITNER, Spenceville, Nevada County, California.

GIANT POWDER

MANUFACTURED UNDER A. NOBEL'S ORIGINAL AND ONLY VALID NITRO-GLYCERINE PATENTS

Nos. ONE, TWO and THREE.

Stronger, Better and Safer than any other High Explosive.

Judson Powder

IS NOW USED IN ALL LARGE HYDRAULIC CLAIMS.

It breaks more ground, pulverizes it better, saves time and money, and is superseding the ordinary powder wherever it is tried. ☞ Triple Force Caps and all Grades of Fuse.

BANDMANN, NIELSEN & CO.,

SAN FRANCISCO, CAL.

MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO., Publishers.

SAN FRANCISCO, SATURDAY, MAY 31, 1879.

VOLUME XXXVIII Number 22.

He Would Know about the Comstock Felines.

"A subscriber and constant reader" writes asking to be informed, through the PRESS, who are the owners of certain mines on the Comstock, the extent to which such mines have been opened, whether they have developed pay ore, whether a general rise in the market would be likely to carry up the prices of these stocks or heavy assessments tend to depress them, and, finally, whether those mines will, in time, pay legitimate profit without extra heavy assessments. Touching the ownership of these properties and the explorations made upon them, information can be obtained by applying to the offices of the respective companies, much relative to the extent and progress of such explorations having appeared from time to time in our Washoe letters, published weekly in the PRESS. In regard to the other points, about which inquiry is made, we may say we have no exact information, though our impression is that the mines in question possess very little intrinsic merit, and will never be likely to enrich shareholders through their dividend disbursements.

As the letter alluded to is but one of many of similar purport constantly being received by us, we will make this an occasion for answering the whole of them in a general way. It has been our uniform practice to discourage persons of small means from investing in Comstock stocks, more especially in those of a purely speculative kind. We are of the opinion that the exploration of these mines should be left to be carried on by rich men or by parties of such considerable means that the loss of a few thousand dollars would not seriously affect them. In this belief we have repeatedly advised all others to abstain from having anything to do with either Comstock shares or mines. The man who cannot afford to lose a thousand dollars where he has half a chance in a hundred to win ten times that amount, should meddle with neither.

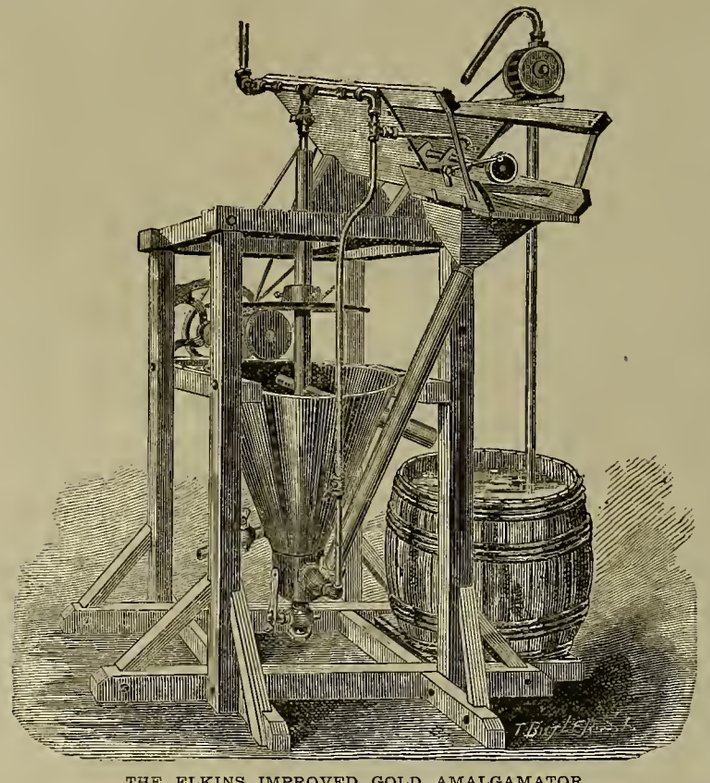
But how insensate must be that person who proposes to embark in this slippery business on information derived through the newspaper press or like imperfect channels. How can he hope for success relying upon such sources of intelligence when the keen, careful and sagacious dealer, after examining the mines in person and availing himself of the services of trained experts, after entering into every manner of combination and exhausting all the sharp expedients known to the profession, comes out very often a loser? It is true one buying hap-hazard might win on these stocks; but then it should be reflected that the day of miracles is supposed to be over.

We declare to our readers and mankind at large that we are possessed of no such knowledge as these inquiries imply, nor do we know of any hapless newspaper establishment that has attached thereunto an intelligence office for giving precise information about each and every mine on the coast, and directing just where to look for a bonanza on the Comstock. Moreover, we are ignorant of any means whereby the locality of such ore bodies can be designated, except it be the machine of Ai Peck, through the aid of which he can, as he claims, accomplish this very desirable end. As Mr. Peck is not a millionaire, he could probably be, through a small coin tender, persuaded to experiment with this machine, occult gift, or whatever it may be, for the benefit of the curious or confiding.

We make it a point to answer, according to the best of our ability, all inquiries in regard to mines and mining matters addressed to us. We like to impart to our readers all the useful information on these and kindred subjects that lies in our power, and we think the files of the PRESS will show that we have taken some pains to do so. But about properties of a merely speculative kind and which, like the mines in question, have at best but a precarious future, we do not pretend to keep posted; first, because those who control and run them do not allow outsiders to know anything more about their condition and prospects than they can help; and secondly, because it is supposed that parties intending to become interested in properties so dangerous will investigate for themselves.

The Elkins Amalgamator.

We spoke last week of the "Elkins Boss Gold Amalgamator," which we saw at work in the basement of No. 318 Pine street, and herewith illustrate the machine. The cut gives a very correct idea of the size, shape and appearance. It measures, screens and feeds itself, so little care is necessary in using it. The inventor says it is capable of amalgamating at the rate of about three tons per hour, and can be run by hand, steam, horse or water power. It has a rotary pump attached which enables it to use the water over again when water is scarce, consuming two or three hogsheads per day. When not using a pump a three-quarter-inch pipe will furnish a supply. The inventor claims that if not forced too fast the machine will save from 90% to 95% of the precious metal in the pulp. The machinery is supported by a frame made from three-by-three joist, about four feet square by five feet high, so arranged that it can be taken apart and tied in bundles for convenient transportation, no part weighing over 150 pounds, the whole machine weighing about 500 pounds. On the frame is a long iron hopper (into which all material may be sluiced or shoveled), in the bottom of which is a screw conveyor for feeding and measuring all material to be treated. At the lower end of this hopper is a shaking screen through which all material must pass, that separates all coarse particles, preventing their passing through the machine. From the screen it drops into a hopper on the upper end of a three-inch iron pipe, through which all material passes into the quicksilver chamber at the lower end of a cone-shaped cast-iron cylinder. It then passes through from three to four inches of quicksilver and is forced by water up to the top of the cylinder through the overflow pipe and off. While passing from the quicksilver chamber it is met by a counter current of fine sprays of water, forced from a series of perforated hollow revolving arms, that washes and settles all fine or flour gold and quicksilver—thus absolutely and positively preventing all loss of quicksilver and precious metals. At the extreme lower end of the large cone-shaped cylinder is the amalgam chamber or safe, which is always kept securely locked, thus preventing all loss by waste or dishonesty. Any ordinarily intelligent man can operate this machine after very little instruction. The price of this machine complete is $250, and the inventor says "the cost of running will not exceed 25 cents per ton in excess of handling the material." It is intended to work earth, gravel, pulp, mill tailings and black sand. Messrs. Elkins & Lynch, No. 318 Pine street, will show the machine at work to any one interested in seeing it.



THE ELKINS IMPROVED GOLD AMALGAMATOR.

Native Brass.

Of late years numerous specimens of brass-like alloys have been found on the shores of Lake Superior and on the Pacific coast, which claim attention from the assertions and general belief among Western miners that they are in fact native brass. As, however, in every case the specimens obtained have not come directly from the mines themselves and in no case through the instrumentality of scientific observers, the truth of the belief may be fairly questioned. The *Mining Record* gives an interesting account of specimens of this alleged native brass forwarded to them for analysis by Mr. Samuel D. Hill of Downieville. These specimens were found in the ravines along the south fork of the north Yuba river in Sierra county. They are small, somewhat flattened concretionary masses from three-fourths to one-fourth centimeters in diameter and without apparent crystalline structure. Their color ranged from dark reddish brown to yellowish white, their streak was faint yellowish white, and they were slightly incrusted with green carbonate of copper. Somewhat brittle, specific gravity of one specimen 8.33. An analysis of this sample by Dr. T. B. Stillman gave: Copper, 85.02%; zinc, 11.02%; antimony, 3.82%; iron, 0.9%; total, 99.95%.

THE financial trouble in Holland continues.

Ball's Improved Dredging Machine.

Mr. John A. Ball, the inventor of two dredging machines previously described in our columns, is now working a third one invented by him, which is the property of the South Pacific Coast Narrow-Gauge Railroad Co. This was built under Mr. Ball's directions and combines the features of the old dredges with various later improvements. The general mechanical principles are the same, but in detail much improved.

The principal difference in this dredge from the others is the peculiar arrangement of iron pipes with flexible joints, employed to convey the mud or earth on shore, after it is raised by the buckets.

The hull of the dredge is 75 feet long, 8½ feet deep and 30 feet wide. At one end is a "spud" strong enough to hold the dredge in place firmly at the same time allowing the after end to swing around, the spud serving as a pivot. At the after end there is a slot 24 feet into the hull, and projecting aft is a frame for the support of the ladders that carry the endless chains and buckets. From the upper to the lower shaft, over which the bucket-conveying chains pass, is 75 feet distance, the buckets running at an angle of 45°. The upper shaft is about 29 feet above water line, making the chute into which the mud drops from the buckets about 25 feet above water line. The lower end of the ladder is lowered, and as the chains revolve the buckets cut out and lift the mud, passing up and dumping their loads into the chute at the top of the machine. As the mud falls from the buckets into the chute it meets a stream of water from two No. 14 Hooker pumps, each of which has a capacity of 1,000 gallons per minute. The mud is thus churned and cut up by this stream, and driven into the mouth of the pipe leading to the shore. It is not so much on hydraulic force that they depend to drive the mud through the pipe, but by its own gravity; the mud and water entering the pipe at a higher point than the end where it is deposited, will run through. The stream is assisted, however, by a hydraulic jet entering the pipe under water, almost in a line with the flowing mass. The mud may be lifted from a depth of 22 feet below the scow, and is elevated, 25 feet above water line, before being allowed to flow off. The line of flexible pipes lies on the bottom of the river or creek, the shore end raising up over the bank to the point where the mud is deposited. It is now being deposited at Oakland creek, where the dredge is at work, about 16 feet higher than ordinary low tide. In digging the slip for the freight boats of the railroad company they have made a deep excavation and built an embankment on the bank, behind which the mud is led by the pipes. This space behind they have filled to a depth of from three to six feet. The pipes carrying the mud are 12 inches in diameter. When it is desired to lift the spud and move the scow to a new position, by reversing a valve the water is drawn out of the pipes which then fill with air and float to the surface of the water. The scow can then be moved without injuring the pipes; at all times when at work the pipes lie on the bottom so that no action of the waves caused by passing steamboats will injure them, nor is there any strain on the pipes.

There is a 12x20 engine and two boilers to furnish power for the buckets and pumps. They have no means of measuring the work accomplished, but the foreman calculated the day we saw the machine at work, that it had raised and deposited on the bank about 800 cubic yards, and thought a full good day's work would be 1,000 yards. The cost is estimated from seven to eight cents per cubic yard. The machine is now digging close up to the bank. The material flows through the pipe rapidly, and they have no trouble with the pipe in choking, as considerable water flows through with the mud. There are a number of improvements comprised in this machine which are worthy of consideration by those interested in dredging or excavating appliances. The feature of depositing the mud on the bank or levee is an important one in this country, as it does away with the expense of using scows and tugs to carry off the mud, depositing it where it will be useful in reclaiming low lands.

CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

Occurrence of Artesian Water.

EDITORS PRESS:—Do the underground currents of water, which supply artesian wells, follow the conformation of the earth, ascending and descending like strata of rock, veins of ore and coal, at altitudes above the ocean level? Can you give the address of the most experienced, practical artesian well-borer in the State, and oblige a subscriber?—JOHN KNIGHT, Sanel, Mendocino Co.

The currents of artesian water may be said to follow the strata beneath the surface, because it is in certain strata that the water moves, but, of course, the curves of these strata cannot be always determined from the careless observation of the surface. Concerning the occurrence of artesian water Prof. E. W. Hilgard, in his article on the subject in Johnson's Cyclopedia, remarks as follows: "Artesian wells are most readily obtained where the geological formations possess a moderate inclination or 'dip,' and are composed of strata of materials impervious to water (rock or clay) alternating with such as, like sand or gravel, allow it to pass more or less freely. The rain water falling where such strata approach to or reach the surface, will in great part accumulate in the pervious strata, rendering them 'water-bearing.' Thus are formed sheets of water confined between two inclined, impervious walls of rock or clay, above as well as below, and exerting great pressure at their lower portions. When water so circumstanced finds or forces natural outlets, we shall have springs; when tapped artificially by means of a bore hole, we have an artesian well, from whose mouth the water may overflow if its surface level be below that of the head of pressure. The principle is substantially the same as that upon which artificial fountains are constructed. Even in the absence of properly water-bearing pervious strata, accumulation of water may exist in crevices or fissures.

"In regions where unstratified rocks prevail, or where the stratified rocks are much disturbed, the finding of artesian water becomes a matter of great uncertainty, and can, in general, be expected only at considerable depths and at low surface levels. In formations possessing but a slight inclination or 'dip,' the head of water pressure may be many miles distant, and a difference of level between its locality and that of the well may not be at all apparent to ordinary observation. It is thus obvious that the study of the geological structure and general surface-conformation of a region, is primarily needful in determining the probability of success in obtaining artesian water in any given locality."

Our querist asks for the most experienced and practical well-borer in the State. We do not know who is entitled to this distinction. The best we can do is to invite well-borers to write to Mr. Knight and give references to the work they have done.

Strikes at Tombstone.

The *Arizona Citizen* states that the developments during the past ten days upon the principal mines in Tombstone are undoubtedly the most important and satisfactory of any since work was commenced there. Upon the Contention the main shaft reached a depth of 162 feet and a drift started upon that level in as rich and well-defined a ledge of ore as any cares to see. The 113-foot level is now open for a distance of 360 feet, and the vein is continuous. Upon the dumps at least 1,000 tons of ore are piled.

Work upon the Lucky Cuss is continued with flattering results. On the lowest of the three shafts a body of very high grade ore, which promises to be extensive, was struck last week. The other shafts and tunnel show remarkably well also. The Corbin 15-stamp mill, which is to work the ore from this mine, arrived at the mill site on the San Pedro last Friday.

The big strike was made, however, in the Tough Nut, and it increases the value of that remarkable mine immensely. Heretofore this mine has been a puzzle even to the owners, for large bodies of very rich ore were found wherever any work was done, but up to last week no well-defined ledge had been struck. In the West shaft, however, is now found as strong and well-defined ledge lying between the limestone and porphyry, as is to be found anywhere. The width of the ledge we are not advised of at present, but it is known to be sufficient to make every one who knows of it very enthusiastic over the future of the mine and of the whole district. The discovery of this ledge gives for the first time a solution of the Tough Nut problem. It is now quite certain that two large ledges are in this mine, the one just found coming down from the West shaft and the other coming across from the work on the Good Enough claim and following the course of the Tough Nut gulch. The two ledges seem to unite at the original point of discovery at crosscut No. 3, where the largest ore body has been always thought to lie. It is the prevailing opinion among those best qualified to judge that the combined ledge continues along the gulch and through the Sweet Nut claim. Large dumps of ore are piled at the various shafts and cuts on the Tough Nut, and there is said to be enough ore in sight to wear out the mill which is now approaching completion on the San Pedro. Supt. Gird expects to have the mill finished by the 20th of this month, and to begin crushing regularly on June 1st.

Some Thoughts on the Glycogenic Functions of the Liver.

[Read before the Chemical Section by JOSEPH LE CONTE.]

II.—Disposal of Waste.

In my previous paper* I attempted to show that the well-known remarkable fact, that nearly the whole food absorbed from the alimentary canal is distributed through the liver before it reaches the general circulation, is proof that, in a very important way, the liver prepares the food for the uses to which it is applied in the animal body; and farther, that this preparation is accomplished by the glycogenic function. According to my view there are three sources of glycogen, viz: 1st. The whole of the *amyloids*. These are arrested in the liver as glycogen and redelivered as liver sugar, little by little as required, and burned. 2d. *Albuminoid excess.* This is split into a combustible portion which is delivered to the blood as liver sugar and burned, and an incombustible portion which is either urea or rapidly sinks into urea and is eliminated by the kidneys. 3d. *Waste tissue.* This is also split in the liver and disposed of like the last. There are the same three sources of vital force and animal heat, viz: 1st. The combustion of the whole of the amyloids. 2d. The combustion of the combustible portion of albuminoid food excess. 3d. The combustion of the combustible portion of waste tissues. Therefore the function of the liver is to prepare *all* the fuel of the body; and this fuel is only liver sugar.

Now it has been brought to my attention that my account of the disposal of waste is in conflict with the usual view of physiologists, which view is supported by many facts. Let us then state sharply the difference.

According to the usual view oxygen taken in at the lungs is carried by the arterial blood to the tissues; there seizes with avidity upon these at the moment of their decomposition, changes them into CO^2, H^2O and urea; and then these final products of combustion only are carried by the venous blood to be eliminated by the lungs and kidneys. According to my view, on the contrary, waste tissue is not burned or changed into final products at once, but circulates as incombustible matter dissolved in the blood; is carried to the liver and there prepared for final combustion and elimination, and only thereafter does it unite with oxygen to form CO^2 and H^2O. We see the contrast: which view is right? There are some facts which strongly support each view. The usual view that waste tissue is burned at once and only the final products of combustion circulate in the blood, is supposed to be sustained (1) by the fact that the change from bright to dark blood, the exchange of oxygen for carbonic acid, and therefore the combustion, takes place, principally if not entirely in the capillaries and therefore in contact with the tissues; and (2) by the additional fact that increased activity of any organ, *e. g.*, a muscle, is attended with increased heat, increased waste and therefore presumably of increased *combustion of waste.* But on the other hand my view is sustained by the experiments of Schiff, already alluded to in my previous paper. These experiments prove in the most positive manner, that poisonous waste is carried to the liver and there decomposed and made comparatively innocuous.

Here then are two incontestible facts. 1st. The combustion of waste takes place principally if not wholly in the capillaries, and therefore in contact with the tissues. 2d. The waste is not burned as such, as soon as formed, but must be carried to the liver to be prepared for final combustion. These two facts must be brought together and reconciled. I think this may be done as follows:

1st. It must be remembered that *waste* is but a *small fraction* of the material used as fuel; by far the larger portion of such material being *food* which never becomes tissue at all, viz: *amyloids* and *albuminoid excess.* Now these also, although they or the fuel made from them are confessedly carried and burned in the blood, are burned principally in the capillaries, and therefore in contact with the tissues. The reasons, then, for burning combustible *food* principally in the capillaries, would equally apply to burning combustible *waste* in the same place; and therefore the fact that combustible waste is burned principally in the capillaries is no argument that it is burned as soon as formed. Evidently then the question is not one which concerns the combustion of *waste* alone, but the combustion of *all* fuel. The question is: Why does combustion of the combustible portion, both of food and waste, take place, and therefore both heat and other forms of force are generated, in the capillaries and in contact with the tissues? The *final* cause is, indeed, plain enough: it takes place there, because there the force is wanted; but what is the *physical* cause, or the process which determines this result? There are probably several.

1st. The blood is much *longer time* in the capillaries than in any other portion of its course, and, therefore, even if the *rate* of combustion be *uniform*, the amount of combustion would be greater there than in any other place. And, moreover, if increased activity increases heat and therefore combustion, it does so because it also increases the blood supply.

2d. But probably the rate of combustion in the course of circulation is *not uniform.* It is probable that the tissues themselves are an apparatus for causing or accelerating combustion. The termination of nerve fibers in the tissues and the controlling influence of nerves over all functions suggests that the discharge or the arrest of nerve current in some way we do not understand, is the principal cause of combustion, and therefore of generation of force there. Farther, it has been suggested to me by Mr. Christy, assistant in the chemical laboratory, that the chemical process may possibly be something like this: Oxygen is carried by the hæmeglobin, the fuel is carried as liver sugar by the plasma, side by side in the same current; nerve discharge reverses the order of affinity, and the oxygen immediately leaves hæmeglobin to seize the sugar. In most tissues, such as many glands, etc., which are constantly active; and in all tissues, so far as the function of nutrition is concerned, the process is continuous and under the influence of the sympathetic or vaso-motor system. In muscular contraction, on the other hand, the discharge is powerful and periodic, and under the influence of the voluntary or reflex system.

3d. It is probable also, nay, almost certain that the first decomposition of tissue short of combustion, *i. e.*, the first formation of waste, being a descensive change—a change from a less stable to a more stable condition—is itself a process by which heat and other forms of force are generated. This of course takes place only in the tissues.

My view, therefore, is briefly as follows: The liver sugar formed from the sources already mentioned, first, commences to burn in the capillaries of the lungs; and second, continues to burn in the course of the arterial circulation. The combustion thus far produces only *heat.* But, third, the main combustion takes place in the capillaries, probably under the influence of nerve discharge, and this part generates not only heat, but other forms of force characteristic of the peculiar tissue. But the fact that the main combustion takes place in contact with the tissues has misled physiologists to believe that the tissues themselves are burned.

It seem to me that physiologists do not even yet sufficiently appreciate the function of the blood as a reservoir. The blood must be regarded as a reservoir, not only for oxygen and carbonic acid, but also and still more for *food*, for *fuel* and for *waste.* It is now well recognized as a reservoir for oxygen and carbonic acid, but not sufficiently for food and waste. The tissue-food of to-day is not used for building to-day, but the blood is drafted upon for materials for this purpose and resupplies itself from albuminoid food. The amyloid food of to-day is not burned to-day, but the blood is drafted upon for fuel and resupplies itself from the liver, while the liver in its turn resupplies itself from the amyloid food.* So, also, waste tissue of to-day is not mainly burned and eliminated to-day, but the blood is again drafted upon for fuel from this source, and resupplies itself from the liver and the liver from the tissues.

Finally, it will be observed that the view which I here present as to the disposal of waste, is, in some respects, intermediate between the view of the old physiologists, under the guidance of Lavoisier, and the modern view. According to the old view, the waste is dissolved in the blood, carried to the eliminating organs, especially the lungs, and *there* burned, with rejection of the products of combustion. The lungs are, therefore, the furnace of the body. According to the usual modern view, oxygen is taken into the blood, is carried to the tissues, burns there on the spot the waste, and the products of combustion are then carried to be eliminated in the lungs. The old view is right in supposing that waste is carried in the blood, but wrong in supposing it to be combustible, and therefore burned as soon as it meets oxygen in the lungs. The modern view is right in supposing that combustion takes place mainly in the tissues and not in the lungs, but wrong in supposing that it is the unprepared waste which is there burned.

* *American Journal*, Vol. XV., p. 99.

* The rapidity with which the fuel supply in the blood is exhausted by activity and restored by food is far greater in some insects, *e. g.*, bees, than in higher animals. In bees, one hour of activity without food entirely exhausts, while food restores in five minutes. This is the result of the extraordinary nervous and muscular activity of these insects.

AN OLD SETTLER.—The Tuscarora *Times-Review* is responsible for the following: About a week ago at the 500 level in the Grand Prize, a blast demolished the residence of a Preadamic frog. At all events, a rather diminutive specimen of that branch of the amphibian species was found among the rock thrown out by the blast. It was brought to the surface, and since that time has been quartered in a jar. When first brought into the upper world it was nearly white and almost transparent, but since then its back has changed to a dingy mottled green. It has no mouth, and, of course, has eaten nothing since its removal from its subterranean abode. Its eyes, which are never closed, not even to wink, resemble two small black glass heads, and are about as expressionless. They are evidently sightless, as objects brought within a hair's breadth of them fail to effect any movement or change in them whatever. Its shape is not like others of its species, except its forelegs and claws, which are disproportionately long. Its sense of feeling and hearing appear to be ordinarily acute, and it is nearly as lively as its surface-raised brethren usually are under similar circumstances. While we will not venture any surmise regarding its history prior to its liberation, we will vouch for the truth of the above narrative and description.

The Wonderful Sinks.

In a late issue we published an account of the Nevada sinks, taken from the Eureka *Sentinel*, maintaining the view that they retain their level through evaporation and have no subterranean outlet. To this the Inyo *Independent* adds: That the sinks and lakes of the Great basin are held to their levels mainly through evaporation is undoubtedly the fact of the case. Mono and Inyo counties have the most notable sinks of the kind in the world. Probably Big Owens lake receives as much or more water than the Humboldt sink. It is not true, however, that the quantity of water is at all times the same; the great lake is now some four feet higher than 11 or 12 years ago. The amount of snow-fall in the mountains is the only thing governing it. In summer heat the total amount of evaporation from its vast expanse of water is incalculable, and doubtless furnishes moisture for the winter snow-fall of the adjoining high Sierras. The minute particles of minerals and alkalies gathered from the soil by the inflowing streams are left in solution in the lake, and during the centuries of this process the lake has assumed its Dead sea character, in which no living thing can exist, save worms and a small nondescript water-fowl. Mono lake is fully 12 feet higher than it was many years ago. At the northwest corner of the lake, near the Freuchman's, the posts of a former sheep corral can be seen far out into the water. A pre-empter recently appeared in the United States Land Office to prove up his claim located five or six years ago. Of his 160 acres he stated that all but 40 acres was under water, and he very naturally did not wish to pay for more than that amount. Some ascribe the fact of the water rising to an increased amount of snow on the mountains during the winter over former times; some believe that the turning of Virginia creek into the lake has caused the change; while others hold to the theory that some secret outlet to the lake has become filled up. Whatever may be the cause, the fact is evident that the lake is rising at the rate of a foot or two a year. There are numerous evidences that in former times Mono lake extended over a vast extent of territory—certainly 10 times as great as now. Is it not possible that in course of time it may again assume its ancient proportions?

Requirements of the Timber Culture Act.

William R. Wheaton, Register of the United States Land Office in this city has written a letter, giving information relating to the timber culture act of Congress, which we reproduce as follows: The timber culture act applies to California, and an applicant under said act is obliged to swear "that the section of land specified in his application is composed exclusively of prairie lands, or other lands devoid of timber; that his filing and entry is made for the cultivation of timber, and for his own exclusive use and benefit; that he makes the application in good faith, and not for the purpose of speculation, or directly or indirectly for the use or benefit of any other person or persons; that he intends to hold and cultivate the land, and to fully comply with the provisions of this act."

The ratio of area required to be broken, planted, etc., is one-sixteenth of the land embraced in the entry. The party making an entry of 160 is required to break or plow five acres during the first year, and five acres in addition the second year. The five acres broken or plowed the first year he is required to cultivate by raising a crop or otherwise during the second year, and to plant in timber, seeds or cuttings during the third year. The five acres broken or plowed during the second year he is required to cultivate by raising a crop or otherwise during the third year, and to plant in timber seeds or cuttings during the fourth year. For less than 160 acres, the plowing, cultivation and planting is to be in proportion. On final proof, it must be shown "that not less than 2,700 trees were planted on each acre, and that at the time of making such proof there shall be growing at least 675 living and thrifty trees to each acre."

If at any time after one year from the date of entry, and prior to the issue of a patent therefor, the claimant shall fail to comply with any of the requirements of said act, then, and in that event, such entry will become liable to a contest in the manner provided in homestead cases, and upon due proof of such failure the entry will be canceled, and the land again become subject to entry by some other person. The fees on entry are $14.

Provision is made in the act for an extension in case the trees, seeds or cuttings planted should be destroyed by grasshoppers or by extreme and unusual drouth.

LUMBER AND LIME.—The great sawmills on Puget sound seem to be running this spring nearly to their full capacity, promising a large out-turn of lumber before the season is over. Lime burning is also active just now and likely to grow into a large and flourishing business on the sound. The kilns are in process of burning; two on San Juan and one on Orcas island. From one of the San Juan kilns there have already been shipped this spring over 5,000 barrels of lime, it being calculated that the season's shipments from this kiln will exceed 30,000 barrels.

MECHANICAL PROGRESS.

Wood for Clock Pendulums.

An interesting discussion recently took place at a meeting of London clock-makers on compensation pendulums. The general judgment seemed to be in favor of plain wooden pendulums for all sorts of timepieces. One speaker said that wooden pendulum rods were generally in use for turret and church clocks, and also in regulators. Another concurred in that statement, and he thought that if wooden pendulums were good for church clocks, they might usefully be adopted for bracket clocks. He had accordingly altered a very old family clock of that description, and of the best London make, by substituting a wooden for a brass pendulum, with very decided advantage. It might possibly be worth while to make a similar alteration generally; brass, being a cheaper and prettier material, having probably been used by the makers of bracket clocks without consideration. A third maker never used anything but wood when he could help it for railway, church or turret clocks. Another speaker considered that one of the advantages in the use of wood for pendulums might be that, in a fall of temperature, when the rod would be shortened, the hygroscopic property of the wood would come into play, which would tend to lengthen it, and so cause a natural compensation by the thermometric and hygroscopic properties of the wood acting in opposite directions. In some climates that certainly might be the case, though in others they would work together, when the effect would be to increase the error. It was stated that a wooden pendulum with a leaden bob had been fixed to a regulator clock in one of the leading shops, and was keeping excellent time. It was a very simple form of pendulum, and might be made very economically. Further testimony was borne to that form of pendulum. Dr. Mann had used one in Natal, which was simply a rod of varnished wood supporting a cylindrical bob of lead. It was, of course, subjected there to great and rapid changes in the atmospheric pressure and to diversities of heat, but it worked excellently for many years. Subsequently it was replaced by one of Fordeham'e best steel pendulums, and though there was some improvement, it was much slighter than might have been expected. In short, it was about as good a pendulum as could be conceived.

Elevated Railways on a New Plan.

According to the Chicago *Commercial Advertiser*, a plan is on foot in that city for the construction of an elevated railroad on a greatly improved plan. Its advantages over other systems are stated to be very great. In the first place, it is perfectly noiseless; the rattle and roar caused by the usual vibrations and echo produced by the running of trains to and from stations is obviated. Thus the inventor (a Mr. Patterson) has solved the problem which Mr. Edison was working out a year ago. It is impossible for the train to jump the track, no matter what the rate of speed may be, thereby insuring safety to passengers and the public underneath. The trucks and underwork of the car are out of sight, being inclosed by ornamental ironwork the entire length of the road. The steam brakes employed are inclosed, and disagreeable noise by the exhaust is avoided. The steam from the engine is exhausted under a casement and condensed, is not seen or heard, and is noiseless. It is also claimed by Mr. Patterson that the many objections caused by darkness of stories and streets is overcome. It does not cast a shadow as much as an ordinary awning. It is said also that the road can be built much cheaper than any now in use, is more substantial, less objectionable to property owners, and does not occupy more space on the pavement than an ordinary telegraph pole, and so arranged as to carry the telegraph wires, thereby doing away with the poles.

Adhesion of Mortar.—In building the Pont de Claix, some experimental blocks were joined by mortar which was allowed to harden for three years, when the mortar was broken by an average load of 142.228 pounds per square inch. This experiment seems to show that the adhesion of mortar to stone is only about one-third as great as the cohesion of the mortar itself. The result is noteworthy, as this adhesion is the true measure of the resistance of masonry. Further experiments of a similar kind are desirable, in order to establish formal conclusions.

Bessemer Steel Inkstands.—With the view of showing how Bessemer steel can be adapted to various purposes, Messrs. Brown, Bayley & Dixon, of the Sheffield Steel and Iron Works, have, by way of curiosity, turned out a number of inkstands manufactured from rail ends. Each of these inkstands is made from a piece of the firm's ordinary Bessemer steel rails, and is without any weld, the holder for the ink bottles, etc., being drawn out of the head, and the pen-rack forged from the flange. The inkstands are not intended for sale, not being sufficiently ornamented for that purpose.

Increase in the Demand for Bessemer Steel.—Fourteen years ago there was only one Bessemer steel establishment in the country. Now there are eleven, with an annual production of more than 500,000 tons.

Track-Laying by Machinery.

The use of labor-saving machinery in various departments of railway construction has become very general, but hitherto it has not been applied directly to the work of track-laying. A device called Moore, Coventry & Co.'s track-layer is now offered to the railway public, and has already been successfully used on the Central Pacific, Illinois Central, Chicago & Alton, and other roads. It consists of the application of a system of adjustable ways, on each side of a train of flat cars, by means of which the rails are brought forward on one side and the ties on the other, in a continuous stream, and delivered to the trackmen on the exact part of the road bed where they are to be laid. By this ingenious method the use of teams for hauling the iron and the ties is entirely dispensed with, thus doing away with a considerable portion of the expense of the ordinary method, as well as with the injury to the road bed by driving upon it. Moreover track can be laid in this way where the nature of the country would prevent the use of teams. It is claimed that by this device from 25% to 50% more track can be laid per day than without it, besides the fact that it dispenses with all the teams and with one-third the number of men usually employed. —*Railway Age.*

The intimation of the *Age* that track-laying by machinery has never hitherto been attempted, is erroneous. A machine—a California invention—for that purpose was given a practical trial in this city some 10 or 12 years ago, and if we mistake not was employed for a short time in the construction of the Central Pacific railroad.

Cupro-Manganese.—A. Raht, in a late communication to the American Chemical Society, says that as early as 1869, several French chemists pointed out that an admixture of manganese to copper, bronze and brass, tends to increase their hardness, elasticity and toughness. Since then, it appears that some parties in France have manufactured a compound styled "cupro-manganese," as a convenient form for alloying. Some cupro-manganese was imported from France into this country about a year ago. Experiments have been made with it by large brass and bronze manufacturers. All these gave, however, negative results; the metal proving more apt to tear and crack under the rolls and punching machines after an addition of this cupro-manganese. No matter how much the inferior European copper may be improved by an admixture of manganese, one can hardly expect the same action on the superior quality of Lake Superior copper. However this may be, it is evident that even inferior copper could not be improved by the addition of a metal with such impurities, as shown by the following analysis of the imported French cupro-manganese. It contains besides copper: Manganese, 16.86%; iron, 0.91; tungsten, 0.20; arsenic, 0.19; zinc, 0.18; lead, 0.14; nickel and cobalt, 0.05%; bismuth, trace; antimony, trace; phosphorus, trace.

New Dummy Car.—There has recently been completed and turned out at the railroad shops in Sacramento says the *Bee*, a new dummy car, in which the locomotive, mail, baggage and passenger compartments are combined. The car will be used on the Northern railway and will run between Woodland and Williams. It is of very neat and compact design, as ornamental in appearance as an ordinary passenger coach and will do away with the use of an engine and numerous cars which have heretofore had to be run between those places. The total length of the car is 61 feet, including the platforms. In front is a small engine with a 7x14 inch cylinder, two drivers, each 42 inches in diameter, and a coal box. Next to this is an apartment for the baggage and mail and then comes the section to be used by the passengers. Thirty persons can be comfortably seated in this apartment. Underneath the baggage compartment is the water tank and the car is provided with the Westinghouse air brakes. The work inside and out has been finely finished and presents a very neat appearance.

Life-Time of a Locomotive.—The iron horse does not last much longer than the horse of flesh and bones. The ordinary life of a locomotive is 30 years. Some of the smaller parts require renewal every six months; the boiler tubes last five years, and the crank axles six years; tires, boilers and fire-boxes from six to seven years; the side frames, axles, and other parts, 30 years. An important advantage is that a broken part can be repaired, and does not condemn the whole locomotive to the junk-shop; while when a horse breaks a leg the whole animal is only worth the flesh, fat and bones, which amounts to a very small sum in this country where horse flesh does not find its way to the butcher's shambles.

Bessemer Steel for Cutlery.—The Sheffield correspondent of the *Engineer* states that efforts are being made in the Bessemer trade to bring out special makes of Bessemer steel for cutlery purposes. These makes are now varied to any given temper. Up to this time the greatest obstacle in using Bessemer for cutlery purposes has been the variations of temper—each rod almost varying so as to cause great difficulty in the hardening. This difficulty has been overcome by the making of specialties, which are offered for even less than what is charged for rail ends, $26 in ingots, as against $45 for "cast." It is said that the Bessemer at $26 is considered equal to the "cast" at $60.

SCIENTIFIC PROGRESS.

The World's Age.

Much speculation and research has been devoted, during the last half century, to devise some reliable means for measuring, approximately, the geological periods, in order to arrive at some satisfactory idea of the age of the earth. "The Age of the World" formed the subject of a very interesting and carefully prepared paper recently contributed to the Royal Society, of London, by Mr. T. Mellard Reade, in which he assigns to our earth a period of existence greatly in excess of the limits generally assigned by physicists. Basing his estimates upon the observed rate of growth of calcareous and other sedimentary formations, the materials for which are primarily furnished by the disintegration of granitic, basaltic, and other crystalline rocks, he draws the startling inference that the elimination of the sedimentary strata must have demanded (as a minimum) at least 600,000,000 years. This period he divides as follows: 200,000,000 years for the formation of the Laurentian, Cambrian, and Silurian deposits; 200,000,000 for the Devonian, Carboniferous, and Poikilitic systems; and an equal period for the elaboration of all the other overlying rocks. These estimates do not differ greatly from those of Buckner.

Commenting upon the above, the *Scientific American* says: Limestones have been in course of formation from the earliest known geological periods, but it would appear that the later formed strata are more calcareous than the earlier, and that there has, in fact, been a gradually progressive increase of calcareous matter. The very extensive deposition of carbonate of lime over wide areas of the ocean bottom at the present day is sufficiently attested by the recent soundings of the *Challenger*. According to Mr. Reade's estimate, the sedimentary crust of the earth is at least one mile in average actual thickness, of which probably one tenth consists of calcareous matter. In seeking the origin of this calcareous matter, it is assumed that the primitive rocks of the original crust were of the nature of granitic or basaltic rocks. By the disintegration of such rocks, calcareous and other sedimentary deposits have been formed. The amount of lime salts in water which drain districts made of granites and basalts is found, by a comparison of analysis, to be on an average about 3.73 parts in 100,000 parts of water. It is further assumed that the exposed areas of igneous rocks, taking an average throughout all geological time, will bear to the exposures of sedimentary rocks a ratio of about one to nine. * * * Mr. Reade is led to believe that geological time has been enormously in excess of the limits urged by certain physicists; and that it has been ample to allow for all the changes which, on the hypothesis of evolution, have occurred in the organic world.

Prof. Tyndall on the Electric Light.—Prof. Tyndall, who was recently examined before the Parliamentary Select Committee, gave a brief history of the discovery of electricity for lighting purposes, illustrating his description by a series of experiments. Volta's discovery he said, had the power of producing heat and light, and if his conception was correct it would have been tantamount to the introduction of perpetual motion. The voltaic battery, however, was not an economical mode of producing electricity. In 1820 a Dane named Orsted found that a magnified needle was affected by the proximity of the electric current, proving the analogy existing between electricity and magnetism. Prof. Faraday had also for many years devoted his attention to the subject, with the result of discovering a new magnetic electricity. In the opinion of the witness very extensive improvements in the electric light must be regarded as inevitable, and seeing what had been done by Mr. Edison there was reason to believe that many of the existing difficulties would eventually be removed. He was afraid that as regarded public illumination, platinum would be found too expensive for general use; nor was he of opinion that the electric light would drive gas out of the field, there being so many uses for the latter.

The Nobility of Science.—And as to nobleness of character, how can one accuse science of striking at it when he sees the minds that science forms, the unselfishness, the absolute devotion to life work that she inspires and sustains? With the saints, the heroes, the great men of all ages we may fearlessly compare our men of scientific minds, given solely to the research of truth, indifferent to fortune, often proud of their poverty, smiling at the honors they are offered, as careless of flattery as of obloquy, sure of the worth of that they are doing, and happy because they possess truth. Great, I grant it, are the joys which a firm belief in things divine confers, but these the inward happiness of the wise equals, for he feels that he toils at an eternal work and belongs to the company of those of whom it is said, "Their works do follow them."—*Renan's Inaugural Address.*

An American Astronomer Honored.—Prof. Lewis Swift, of Rochester, has been elected a Fellow of the Royal Astronomical Society of England, as a token of appreciation of his astronomical discoveries.

Another new Metal.

The services the spectroscope is capable of rendering to science becomes more and more evident daily, the latest proof of the fact being the discovery of a new metal called scandium. In some of the mines in Sweden and Norway small quantities of earthy minerals are found, called gadolinite and euxenite, composed of oxides of very rare metals. The bulk of the substance is of a rose-color, arising from the presence of erbium, and is called urbine. At first it was supposed to be simply mixed with some earthy substances which rendered it impure, but not long ago M. Marignac discovered the presence of another metallic substance, which he called ytterbine, the oxide of ytterbium. However, great uncertainty existed as to the composition of these bodies, and M. Nilson undertook a series of experiments on the subject. M. Berthelot, at the late meeting of the Academy of Sciences, gave an account of what had been done so far, the result being the discovery of a new metal to which M. Nilson has given the name of scandium, to indicate that it is of Scandinavian origin. Erbine is, as before mentioned, of a brilliant rose-color, while ytterbine is white. But the separation of the two substances can only be effected with extreme difficulty. The earth has to be dissolved in boiling nitric acid, and the ytterbine then precipitated by sulphuric acid; and M. Nilson found that the operation repeated more than 20 times did not completely separate the two bodies. When he had obtained a comparatively pure ytterbine he commenced an examination of it, and then he found that it gave absorption bands in the spectrum unknown to any substance previously examined. After repeated trials he became convinced that he was dealing with a metal never before suspected, and he continued his researches. He is unable to say at present what may be the chemical properties of the new body, as the quantity of material at his disposal was insufficient to allow him to isolate the metal. Nor can he decide as yet the place the new metal is to take among the older ones, but he considers that its properties differ materially from those of erbium and ytterbium, and that it should rank between tin and thorium, as the atomic weights of these two are 118 and 234, while he calculates that of scandium at from 160 to 180.—*Galignani's Messenger.*

Telephone Exchanges.—The system of "Telephone Exchanges," one of the most useful and practical outgrowths of the introduction of the telephone, appears to be coming into very general use, and to serve an admirable purpose. At first the telephone was limited to short, private lines, each operated separately and independently. By the new system, however, a field has been opened for it of practically unlimited extent, and greatly increased utility. As some of our readers may not be aware of the features of this recent development of the telephone, we may state that it consists in the establishment of a central office, from which wires run out into the offices, stores, mills, residences, etc., of the members or subscribers. When one member desires to talk with another, the central office is notified of the fact, his wire is connected with that of his neighbor, and communication is established. By this arrangement, it is obvious that each subscriber can be put in direct communication with all the others, and the pronounced advantages of the plan will be obvious to all our readers. The *Journal of the Telegraph* comments with satisfaction on this new feature of the device, noticing among other things that the demand for the introduction of telephone exchanges, even in small places, is very urgent, and is constantly increasing as their advantages become known, and believes that they will eventually be found in every place of sufficient importance to require them.—*Engineering and Mining Journal.*

The Constitution of Meteors.—The Paris Academy, says *Nature*, has just awarded the Lalande medal to M. Stanislas Meunier for his researches into the constitution of meteors. M. Daubree had already shown that there existed a close connection between these falling bodies and the lower strata of our own globe. M. Meunier has carried the same line of research further, and proved that this analogy is not confined alone to mineralogical constitution, but that it extends to the relations which these cosmical materials, disseminated in space, present when compared amongst themselves. The academy considered that M. Meunier had reason to conclude from his experiences that all the masses once belonged to a considerable globe, like this earth, of true geological epochs, and that later it was decomposed into separate fragments, under the action of causes difficult to define exactly, but which have more than once been seen in operation in the sky itself. Such a conclusion, it is remarked, adds greatly to the interest attaching to these "minute stars." The astronomer, once occupied only with their motions and their probable distribution in space, finds himself confronted with a sideral geology, as he already was under the necessity of having regard to celestial physics, celestial chemistry and celestial mineralogy.

Dew.—The commonly-accepted theory that the phenomenon of dew is produced by the condensation of the moisture of the air by contact with surfaces of a lower temperature, is rejected by Prof. Stockbridge, of the Massachusetts Agricultural College, who defines it to be the vapor of the soil condensed by the cooler air.

Mining Share Market.

From boginning to end of the week the market has been growing in streugth. This hardening has been almost general, and all aloug the line a better and increasing speculative disposition may bo seen. Tho remarkable feature of the advance is that it is extending the list of favorites to entirely new and outside quarters, The public taste seems to have thoroughly palled of the Virginia stocks, and refuses to be pleasod with anything hut Bodies. In fact, for a time, the latter seemed to have wholly oxcluded the old favorites of the Comstock from the field of speculation. Like most things relating to stock-dealing, tho reasons why "this is thus" are impossihlo of explanation. There have been no developments in the mines themselves to warrant the iuflation, and it is noticeable that the solid ore producers among the Bodies have not kept pace with the wild cats in the advance. The levers which raised them into prominenco were huge promises, and the report that Eastern investors in these stocks are becoming so excited, that a riso of unusual magnitude might certainly he expected before their demands would be satisfied. Be it as it is, the change is refreshing, and the corner-stone seems laid for a remarkably lively market. The Comstocks have recovered somewhat, but unless a marked and instantaneous change takes place in some quarter, they will he likely to he left behind in the race for the puhlic favor.

The Inter-Oceanic Canal Route.

The telegraph aunounces that the Inter-Oceanic Conferencc, which for some time past has heen in session at Paris, has decided on the Darien route for the proposed oceanic ship canal. This route is the one proposed hy Messrs. Wyse and Reclus, and it is estimated will cost ahout $210,000,000. By it a canal is to he cut through the isthmus from 80 to 90 miles in length, which shall be without locks. That is, it is proposed either to cut a hole hroad enough and high euough for the passage of the largest ships, masts, spars and all, through the Andes or to cut the Andes down eutirely, not only to the level of the sea, hut far enough below its surface to float the largest and most heavily ladeu vessels. The time necessary for the accomplishment of the undertaking has heen calculated at from 12 to 18 years, and the time of passage through it when completed for vessels will he two and a half days. There are a number of reasons for considering this scheme in an unfavorable light and at least for distrusting the motives of the parties interested. It is a generally expressed opinion that several others of the seven schemes proposed to the conference were more feasible hoth in point of expense and ease of accomplishment than the one selected, and many prominent journals openly charge that the present end was reached wholly hy the skillful engincering of Lieut. Wyse and bis adherents, who are hacked hy strong Freuch interests and have personal aims in view. Certainly the scheme appears to have heen gotten up regardless of expense, and looking at the engineering difficulties to he overcome, we fear that its motives are somewhat less than honest. Admiral Ammen, the American delegate, has throughout opposed the scheme on the ground of its impracticahility, and advocated at all times the cheaper routes lying farther to the north. Still, now that the Darien scheme has received the sanction of the conference, the whole body of American engiuers have tacitly accepted the situation. They say that the United States wants a canal, and that its location is an entirely secondary considcration, as compared with its actual construction at some one point. It is to be hoped that the canal will actually he constructed. But, taking into account the difficulties to be overcome, the enormous cost, the hampered means of obtaining the necessary funds, and the way in which the joh has been lugged through the committee, it seems much more prohahle that it will never exist, except in the floating stock, and that instead of the many millions which will be saved hy it to American commerce, we shall see our dollars quickly disappear in the pockets of these dishonest French speculators.

Bullion Shipments.

Christy Con., May 23d, $5,802; Argenta, May 26th, $11,000; Independence, May 26th, $8,000; Northern Belle, May 21st, $2,401.25; Ophir, May 21st, $15,046.86; Standard, May 23d, $37,086.92; Alexander, May 24th, $8,757.39; Hillside, from May 25th to May 28th, inclusive, $15,940; California, May 24th, $59,937.40; Silver Prize, May 24th, $2,876; Martin White, May 21st, $5,671.33; Northern Belle, May 24th, $4,753.04; Con. Virginia, May 26th, $70,141.59.

Mining Summary.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

CALIFORNIA.

AMADOR.

About Plymouth.—*Ledger*, May 24: The tunnel in the north shaft of the Phœnix is progressing finely. Some very good rock is being extracted. A raise is being made from the 1200 to the 1100 levels, which, when completed, will afford ventilation for the 1200-ft tunnel. The mine and milli have been idle for a week, for want of timbers The mine resumed work on Saturday morning, and the mill will be started up as soon as there is rock to run on. The contract in the New London mine is finished. The agreement was to clear out the old shaft to the depth of 80 ft for $100, expecting to reach the bottom at that depth. But the bottom was not there. Mr. Hamilton has now given it out by the day. The old tunnel that runs into the Snake mine is being opened. It has caved in considerably near the mouth, but a couple of weeks' work will see it pretty well cleared of debris. If quartz is found at the end of the tunnel and report says it is there, and worth $14 per ton—the Pioneer company will likely get a good price for the claim from San Francisco capitalists. Not far from this tunnel stands the foundation of the old mill, which was destroyed by fire years ago. A few wooden pillars are the only relics left. Some party is in the habit of crushing and cobbing very rich ore and sulphurets obtained near this mill. Small pieces of quartz may be picked up showing free gold and sulphurets. Where did this rock come from, is a question. The Centennial mine and mill, on Dry creek, are both idle at present. Several suits are pending in the District Court against the company.

Trying to Cross the Mountains.—*Dispatch*, May 24: A party of eight men and three women are just now above Ham's station, in this county, where they have been temporarily stopped, in their effort to cross the mountains to Hope valley, whither they go (or rather wish to go) to commence work upon the Barnes mine. When they first struck deep snow they commenced to shovel a roadway for their teams; but the task soon became too much for them, so they concluded to build sleds. They hope, in this manner, to complete the trip without further material delay; but those who are best acquainted with the route, consider it rather a hazardous undertaking, and even think it impossible to make the trip before June. At the point reached with wagons the snow was six or seven ft deep; and there has been considerable snow fall during the last few days.

BUTTE.

About Concow.—*Mercury*, May 23: The mining operations on the West branch are unusually brisk this year, several companies being at work. The celebrated Bruce claim, near the mouth of East branch, has been put in working condition, and is yielding rich returns. There is a quartz mill in course of erection on the ledge known as the McConnell ledge, situated at Yankee Hill. It is to he water power, run by water from the Spring valley ditch. The mines in general about Yankee Hill have yielded fair returns this spring, owing to the wet winter. The average amount exebanged at M. H. Wells' store is from 10 to 12 ounces per week.

Mining Boat Launched.—The new boat intended to work the ground belonging to the old Henrietta mining company, was launched Tuesday. There were numerous spectators present, including Mr. Haggerty, one of the stockholders in the new company, Mr. Moreau, inventor of the machine with which the boat is to be equipped, and Mr. Klostermann, secretary of the Henrietta company. The boat is 100 ft in length by 30 wide, and weighs in its present condition 130 tons. When the machinery is put in position on the craft, the combined weight of the two will aggregate 160 tons. An engine and boiler of 125-horse power has been ordered to run the machinery with. The latter has already arrived and the former is daily expected. Tbis boat is the most substantial one yet erected for mining on Feather river. It is well built throughout, the timbers and planking being of the best Oregon pine and the frame-work is thoroughly bolted together. It is expected that the boat will be ready to begin active operations by the first of next month. The company owning the vessel have leased considerable ground from the Henrietta company, and intend making the experiment pay if such a thing be possible. That they are energetic and competent business men, the enterprise already displayed by them fully proves, and we fervently hope the gentlemen will strike the bonanza so generally believed to exist in that vicinity.

CALAVERAS.

Murphy's Camp.—*Chronicle*, May 24: Herbert & Co.'s mine, located about five miles south of Murphy's, on the Stanislaus slope, is giving a splendid account of itself. The lead is from 8 to 14 inches in width, and "chock full" of the precious metal. The company owning the mine have out a crushing of rock, which good judges estimate will pay at least $125 per ton. The rock will be crushed in Taylor's mill. The celebrated Collier mine, located in the same district, is also being energetically and profitably worked. The mine is worked through two tunnels, which have been driven in on the lead 80 and 140 ft respectively. Lead at present about 14 inches in width. Mr. Collier bas a 5-stamp mill on the mine, which is kept steadily pounding out the precious ore day and night. A recent clean-up, after a short run, yielded $1,300. The "Christmas Gift," owned by Mr. Corea, is also proving a valuable piece of property. The lead is a wide one, and the rock averages $15 a ton. Mr. Cores will have out a crushing shortly, there being now about 15 tons on the dump.

Upper Country Jots.—McBetb & Tennel, owners of a promising lead on the Nortb fork, lately crushed 17 tons of rock in Carlton's mill that paid $54 a ton. Hillery & Reed, proprietors of the Lone Star mine, are taking out rich rock and plenty of it. Messrs. Haskins and Hadley, proprietors of the well-known Champion mine, at West Point, have struck a 3-ft ledge in the 420 level. Our informant says that the rock is the richest ever taken from the mine. Porteous & Rose, owners of the "New Constitution" mine, in Soaproot gulch, are working away energetically and profitably on a two-ft vein; 150 cargoes now on the dump.

Outlook.—The mining outlook in this county at present is very flattering. There is plenty of water, and the finds in many places have proven very profitable. Prospecting companies are as thick as flies in summer.

DEL NORTE.

Resumed.—Crescent City *Courier*, May 21: Work has been resumed on the Haynes' Flat mining ditch, and the prospects are good for its speedy completion. About 50 men are already employed in executing the work.

EL DORADO.

Esperanza Mine.—*Mountain Democrat*, May 24: Our latest advices from the Esperanza mine, near Garden Valley, are to tbe effect that the new drift has been run 29 ft through the ledge, and no hanging wall yet, and it is confidently claimed that the entire 29 ft will average fully $8 per ton. This seems like a fabulous story, almost unbelievable, but it comes well authenticated and with ample corroboration. It is certain that nothing equal to this has ever before been seen in El Dorado county.

INYO.

Rex Montis.—*Independent*, May 17: We were yesterday favored with a call from George C. Potter and D. Henshaw Ward, respectively President and Secretary of the Rex Montis mining company, representing the great interests comprised in the Rex Montis, the Independence tunnel and the Shawmut consolidation. They left last evening for the mill, and will spend time enough to thoroughly inspect all the mines now working on Kearsarge mountain. They have settled all company business and satisfied all of the remaining claims against the property. Superintendent Holt has been engaged in repairing the mill, and has made it as perfect as can be without increased power, which, however, can readily be obtained at comparatively small expense, by increasing the pressure of water or putting in another wheel. A short run was made on ore from the Inyo mine, or the "Sardine company" property, now being worked by Mike Welch and others. Foreman Walker, in charge of the Rex Montis mines, will be able to show the San Francisco party some most favorable developments, made by him at the close of work last season.

MONO.

Various Mines.—*Standard*, May 24: The pumping apparatus for the Mono mine will be here in a few days. As soon as it is in position, Mr. Daly will sink his shaft 200 ft further, or to a depth of 600 ft, when he will again crosscut. This will give sufficient depth under the cap rock to render the probability of finding the ledge thoroughly mineralized much greater than on the present level. Mono's operations will hereafter be regarded with increased interest. C. A. Gould, Superintendent of the Brooklyn Con., arrived this morning and has entered upon the discharge of his duties. He informs us that hoisting machinery is now on the way, and as soon as placed in position the most vigorous prosecution of work for a deep shaft will be entered upon. The mine is in a good location, and, with proper development, will soon occupy a prominent place in the list of the paying Bodies. The winze which is being sunk from the 220 to the 320 level of the Blackhawk is now down over 50 ft. It has been in good ore all the way, and the ledge has maintained a width of from three to four ft. The north drift on the 320 level is showing a great improvement in the ledge over the point where first cut, while in the south drift it is about the same. Superintendent Ferguson expects to cut the McClinton ledge in the east and the Yosemite in the west crosscut on this level within a short time. The Mega mine is said to be improving every day, and the knowing ones declare that there is a bonanza in Bechtel. A rapid rise in both these stocks within a few days is among the probabilities. From the 1st to the 19th of May, the bullion shipments from the Bodie mines amounted to $100,455, of which $66,196 was from the Standard.

Standard.—*Standard*, May 26: Principal interest just now is centered upon the new ledge cut from the new works, and drifted on north, nearly if not quite 200 ft. It has gradually widened from 15 inches to 15 ft, and possibly more, as the hanging wall is not reached. The ore is clean and will average over $100 per ton. Crosscutting on the 700 level is progressing, with the best of indications; stringers of quartz rich in gold coming in, and the general formation favorable for a ledge at no distant day. Work is doing systematically at so many different points that it is impossible to give a detailed description in a general review of the district. It is safe to say that the mine is opened four years ahead, based on present milling facilities, and this pertains to that portion of the mine above the 400 level alone.

South Belvidere.—Work on this mine has been pushed ahead with all possible speed. At present the company is engaged in sinking a working shaft, which has reached a depth of 65 ft. A few days ago a ledge of clay and quartz was passed through. The vein is about two ft wide and prospects well in gold. The shaft will be continued down to the depth of 100 ft, when crosscutting will be commenced toward the ledge, where very important developments may be expected.

Noonday.—The north drift on the 200 level is 195 ft in length, carrying ore body as usual; winze therefrom is down 45 ft, in good ore. The east crosscut north of shaft is in 23 ft; an 18-inch vein of good ore was passed through. The west crosscut, south of shaft, is in 43 ft. The joint shaft, on the line of North Noonday, is down 83 ft. Machinery for this shaft is all on the ground, and building under way. Ore enough only to keep Miners' mill running, is being extracted.

South Belcher.—Work on the mine has progressed favorably. The south drift from the east crosscut, on the 350 level, has been advanced 10 ft, making a total length of 48 ft. The ledge is three ft wide of good ore. North drift, on same level, has been advanced 15 ft, making a total of 29 ft. The ledge in the face is still looking well, showing a vein of ore two ft wide.

Belcher.—The drift north on the Stonewall ledge is in about 60 ft, with two ft of rich ore. South drift is extended about 70 ft; ledge two and one-half ft wide, and looking well. This work on the 400 level. On the 300 level, drift south is in 160 ft; ledge three ft wide, of good ore.

NEVADA.

Mining Notes.—*Foothill Tidings:* A good clean-up of quartz from the New Rocky Bar has been made. The amount crushed was 135 loads, which yielded $35 per load, not including the sulphurets, which, according to their assay value, will run up the total yield to $40 per load. The case of the Rising Star and Eclipse mining claims vs. the B. M. Ex. mining claim, which has been pending in the Land Office at Washington for a long time on an appeal from the decision of the Sacramento Land Office, has been decided in favor of the B. M. Ex. company and the adverse claim dismissed. The Planet gravel mining company have levied an assessment of two cents per share upon the capital stock, amounting to $1,000. Now that the location of the pay channel has been definitely ascertained, the stockholders are quite buoyant over the prospects of the mine. The hydraulic mining companies will have a long season of washing, as the water supply is abundant. Ruhe Thomas is running his hydraulic diggings on the "Slide" day and night, making the most of the water while it lasts. He is using one pipe which throws about 140 inches of water. Washing has been going on steadily for three months, and a large extent of ground has been washed off. The ledge in the Live Yankee is widening out and growing richer. The Merrifield mine is an established success. The buildings, machinery and underground workings are in splendid condition. The ore body continues to improve in size and richness. Two clean-ups have been made within the past 30 days, the last of which was represented by a bar of gold worth nearly $5,000. The Smith mine, at the Half Mile House, is looking better and better every day. The ledge is getting into first-class shape, and a recent crushing of ore gave good returns. The Derbec gravel mine has started up again, with miners' wages at the old price, $3 per day. At the El Capitan mine, Gold Flat, a small force of men are now at work sinking and timbering the incline. The ledge improves with every ft it is sunk on. The Knight of Malta has elected, President, Bruce B. Lee; Secretary, Charles W. Kitts; Treasurer, David Watt; Superintendent, Charles W. Smith. The shaft is 114 ft deep, and will be pushed with all possible speed to the 200 level, when regular drifting will be commenced.

Rocky Bar Mine.—Grass Valley *Union*, May 27: The Rocky Bar mining company has purchased the engines and hoisting machinery of the Swiss-American mine, and will have them put in place over the old Chavanne shaft, for the purpose of clearing the shaft of water, and through which to hoist the rock that will be excavated from the drain tunnel that is to be connected through from the New York Hill ground. The work of retimberiug the shaft down to water level is nearly finished, there not being as many new timbers required as anticipated. The work of opening up the drain tunnel is to be pursued as fast as circumstances will permit. The ledge in the mine, at the new working shaft, is looking very well. About 60 loads of ore are now on the dump, preparatory to another crushing soon to be made at Sothern's mill. The company has levied its first assessment of 10 cents per share, amounting to $2,200, to pay for the purchase of the engines and hoisting machinery.

PLACER.

Quartz Items.—*Herald*, May 24: The 700 level of the Crater mine is turning out some very fine rock. At the hoisting works there are about 100 tons of ore on the dump. The mill, it is expected, will be started up next week. J. S. Davis has leased the Eclipse mill with the intention of running it mainly on custom rock. Shurtleff is taking some splendid rock out of his mine on Duncan hill. The Tremdlan Bros. are taking out some good ore from a ledge they are working near the old Bellevue. Pellow is also getting a fine prospect from a ledge in the same vicinity. Mrs. Kittler still has men at work on her ledge near the Crater, with good prospects. Mining men from below are coming to Auburn, or passing through Auburn, for the upper portions of our county in a perfect stream. There will doubtless be many locations made in Placer this season, and probably much money spent. It is being found out that few sections pay better on capital invested in mines than old Placer.

SIERRA.

Forest City Mines.—*Mountain Messenger*, May 24: The Bald Mountain is going on in good style, taking out plenty of gold, and hiring a large crew. The North Fork is working about 40 men, and the outlook for that unfortunate but persevering company is better than ever before. The gravel is paying about $4 to the man, which leaves a margin over expenses. They are running ahead in the quartz ledge, and are taking out good millling rock, with an occasional rich specimen, but nothing like the wonderful pocket they had when the ledge was first struck, although the rock is improving all the time. The South Fork company is not doing anything as yet, but will run farther into the hill as soon as spring opens. It is undoubtedly a good claim, or rather it is a large claim with good pocket in it. Some years ago, when the old Live Yankee tunnel was open, some of the present South Fork company ran across into the South Fork ground and got good pay. They started a new tunnel, and having lost the bed rock, sunk down and found a deep channel; but every attempt to work it has failed, owing to water. Last fall the company returned to its original purpose, and the coming summer will see South Fork numbered among the paying mines. The Bald Mountain Extension tunnel is going ahead at railroad speed, and at the present rate will be on the company's ground within a year ready to prospect. This tunnel is the farthest east, and is running directly into the huge ridge of gravel which extends for miles to the east, between the North and Middle Yuba. This ridge has never been prospected to the center in any place, and is a field well worthy of the attention of capitalists. The Oriental quartz mill is temporarily shut down for want of wood; but the mine is still being developed, with some good rock in sight.

TRINITY.

Rich Cement.—*Journal*, May 24: Fred Haas showed us some fine specimens of cement taken from his claim near Junction City, which were marvelously rich. Specks of gold are freely visible, contrasting brightly with the dark blue color of the cement. The gold is rather coarser in character than the general run of river gold, and undoubtedly found its way into the claim from Oregon gulch.

TUOLUMNE.

Mining Notes.—*Independent*, May 24: It is many years since mining has been so vigorously prosecuted in this district as is the case at the present time. The Spring Gulch mine is producing from its large vein, ore freely speckled with gold; while at the Consuello and Live Oak mines excellent ore is being taken out. The Louisiana mine is keeping the mill and two arastras fully occupied. The Confidence mill of 40 stamps, the Soulsby, the Riverside and the Evans mills are running all the time, and the milling power at the Heslep and Keltz mines is to be increased, to crush more rapidly the large bodies of ore opened out in each of these mines. A busy and prosperous season is anticipated, and good times looked for, both for the enterprising capitalist and the industrious miner.

NEVADA.

WASHOE DISTRICT.

Belcher.—Gold Hill *News*, May 23: The main incline has been sunk 31 ft on the slope below the 2700 level, and the station at that level is now being opened out. The drift south, 2560 level, has been discontinued for the present to run a crosscut east from a point 430 ft south of the incline. This crosscut is now in 20 ft, the face in quartz and porphyry, but it has not yet reached the ledge. The mine will be shut down for 24 hours to repair the V-bob at the bottom of the vertical portion of the air shaft.

Sierra Nevada.—Sinking the incline for the 2400 station. The work is all to the east of the incline, and consequently does not strike the ore body proper. The flow of water is strong, 125,000 gallons coming in every 24 hours. It is, however, readily handled since the three new pumps are in place in the east shaft, and are working well. The stopes are still being extended both south and west and are showing a broad breast of fine ore. The yield is now 65 tons per day, 25 tons more than the Mariposa mill is capable of reducing.

Justice.—The main lateral drift south, 1550 level, and west crosscut No. 1, same level, are both in quartz giving low assays. The Waller Defeat shaft is yielding 30 tons per day of first-class ore and 25 tons per day of second-class ore. Tbe stopes look well and indicate a large body of ore.

Silver Hill.—The north drift, 1100 level, is averaging about five ft per day. The workings in the southeast drift from the new shaft in the Waller Defeat ground are yielding 15 tons of good ore per day.

Uthir.—The incline is being pushed down at the rate of two ft per day, the bottom 68 ft below the 2300 station, and has during the week cut streaks of clay and veins of porphyry dipping east. The workiugs east from the 2300 station have reached a distance of 38 ft, the face still in vein porphyry showing streaks of quartz. The south drift on the 2100 level, and from the bottom of No. 1 winze, is now in 110 ft and in good ore.

Con. Virginia.—The average yield of the stopes for the past week has been 126 tons per day and $70,141.59 in bullion were shipped last Monday evening. The joint California drift west, 850 level, is making five ft per day, the face still in hard porphyry. Joint crosscut No. 1, 1850 level, is making three ft per day, through a lively-looking vein formation, giving low assays.

California.—The stopes have, during the past week, yielded an average of 180 tons per day. Total bullion shipments to date this month, $117,250.43. Joiut Con. crosscut No. 1, west. 1850 level, is in 63 ft in a fine vein formation, the quartz of which yields low assays.

Union Con.—The main south drift, 2300 level, from the Sierra Nevada incline, is making three ft per day along the east line of the ledge; total length, 165 ft. It is still encountering a lively-looking vein formation, carrying some water. The main north drift, 2000 level, is in blasting porphyry, its face 328 ft from the south line.

Con. Imperial.—The joint Alpha winze is averaging four ft per day, in increased depth, and is now down 270 ft, on the slope, below the 2400 level, the bottom in quartz and porphyry, through which considerable water seeps. The south drift to be continued on to the Crown Point for a water drain has also received its requisite attention.

Mexican.—The joint Union winze from the 1600 level is encountering a very strong flow of water, which makes sinking very slow. The bottom is besides in very hard porphyry; total depth, 420 ft, on the slope, below the 1600 level.

Gould & Curry.—The east drift, 1700 level, continues to make good progress through porphyry and clay carrying some water, its face 930 ft from the lateral drift.

Crown Point.—Still drifting north on the 2500 level along the wall of the ledge. The incline has reached the 2700 level, and the station there is being cut out.

Utah.—Three ft per day are being added to the depth of the incline, which is now 545 ft on the slope below the 1350 level. There has been a slight increase of water of late, but it is readily handled.

Hale & Norcross.—The drift east, 1640 level, has connected with the Julia branch of the Sutro tunnel. Total length, 208 ft.

Savage.—Retimbering the incline and the north lateral drift, 1600 level. The machinery at the shaft continues to receive needed attention.

North Bonanza and Flowery.—On the 300 level tbe crosscut in Flowery was found to have some 10 or 12 ft further to go to get to the ledge than was supposed. That

New Problems in Mensuration.

[Read before the California Academy of Sciences by PROF. GEORGE DAVIDSON, April 7th, 1879.]

XVII. Given the height, h', and the diameter of the base, b', of a solid cone (Fig. XVII), to determine, in terms of the given height and diameter of bass, the consecutive heights and diameters of bases of any required number of shell cones and a central cone, having equal volume with each other, into which the given cons is to be sub-divided.

To divide the given cone into n shell cones and a central solid cone, let h' equal the height and b' the diameter of the base of the given cone; x, y, z, * * * (w—1), w, the consecutive heights, and x', y', z', * * * (w'—1), w', the consecutive diameters of the bases of the required shell cones and solid central cone; then

$$x^3 = \frac{(n-1)h'^3}{n} \quad : \quad x^3 = \frac{(n-1)b'^3}{n}$$

$$y^3 = \frac{(n-2)h'^3}{n} \quad : \quad y^3 = \frac{(n-2)b'^3}{n}$$

etc., etc., etc., etc.

$$(w-1)^3 = \frac{2h'^3}{n} \quad : \quad (w'-1)^3 = \frac{2b'^3}{n}$$

$$w^3 = \frac{h'^3}{n} \quad : \quad w'^3 = \frac{b'^3}{n}$$

XVIII. Given the heights, h, h', and the diameters of the base, b, b', of a shell cone with parallel sides (Fig. XVII) to determine, in terms of the given heights and diameters of base, the consecutive heights and diameters of base of any required number of shell cones having equal volume with each other, into which the given shell cone is to be sub-divided.

To divide the given shell cone into n similar shell cones of equal volume with each other, let h' equal the outer height, and b' the outer diameter of the base; h equal the inner height, and b the inner diameter of the base of the given cone; x, y, z, * * * (w—1), w, the consecutive heights; x', y', z', * * * (w'—1), w', the consecutive diameters of base of the required sub-divisions, both reckoned from h', b'; then

$$x^3 = \frac{h'^2}{b'^2}\left\{\frac{(n-1)\ b'^2\ h' + b^2\ h)}{n}\right\}$$

$$x'^3 = \frac{b'}{h'}\left\{\frac{(n-1)\ b'^2\ h' + b^2\ h}{n}\right\}$$

$$y^3 = \frac{h'^2}{b'^2}\left\{\frac{(n-2)\ b'^2\ h' + 2b^2\ h}{n}\right\}$$

$$y'^3 = \frac{b'}{h'}\left\{\frac{(n-2)\ b'^2\ h' + 2b^2\ h}{n}\right\}$$

etc., etc., etc., etc.

$$(w-1)^3 = \frac{h'^2}{b'^2}\left\{\frac{2b'^2\ h + (n-2)\ b^2\ h}{n}\right\}$$

$$(w'-1)^3 = \frac{b'}{h'}\left\{\frac{(2b'^2\ h' + (n-2)\ b^2\ h}{n}\right\}$$

$$w^3 = \frac{h'^2}{b'^2}\left\{\frac{b'^2\ h' + (n-1)\ b^2\ h}{n}\right\}$$

$$w'^3 = \frac{b'}{h'}\left\{\frac{b'^2\ h' + (n-1)\ b^2\ h}{n}\right\}$$

XIX. Having divided a shell cone into any number of similar shell cones having equal volume with each other, to determine in terms of the two given heights and the two diameters of the base, the consecutive heights and diameters of base of any number of similar shell cones formed inside the given shell cone, each having equal volume with the sub-divided shell cones.

Suppose the given shell cone (Fig. XIX) ie to be sub-divided into p similar shell cones of equal volume with each other; and that there are required, inside thie shell cone, n similar shell cones each having equal volume with the given sub-divisione; then let h equal the outer height, and b' equal the outer diameter of the base, and n equal the inner height, and b the inner diameter of the base of the given shell cone; and let x, y, z, * * * (w—1), w, equal the consecutive heights, and x', y', z', * * * (w'—1), w', equal the consecutive diametere of the bases of the required sub-divisions, both reckoned from h and b, then the height and diameter of base of the nth inner shell cone are

$$i_n^3 = \frac{h^2}{b^2}\left\{\frac{(n+p)\ b^2\ h - n\ b'^2\ h'}{p}\right\}$$

and

$$i_n^3 = \frac{b}{h}\left\{\frac{(n+p)\ b^2\ h - n\ b'^2\ h'}{p}\right\}$$

XX. Having divided a shell cone into any number of similar shell cones having equal volume with each other, to determine, in terms of the two given heights and the two diamctere of the base, the consecutive heights and diameters of base of any number of similar shell cones formed outside the given shell cone, each having equal volume with the sub-divided shell cone.

Suppose the given shell cone (Fig. XX) is sub-divided into p similar shell conee of equal volume with each other; and that there are required outside this shell cone n similar shell cones, each having equal volume with the given sub-divisions; then let h' equal the outer hsight, and b' equal the outer diameter of base, and h equal the inner height, and b the inner diameter of base of the given shell cone; and let x, y, z, * * * (w—1), w, equal the consecutive heights, and x', y', z', * * * (w'—1), w', equal the consecutive diametsrs of the bases of tbs required sub-divisions, both reckoned from h' and b', tben tbe heigbt and the diameter of the base of tbe nth outer shell cons ere,

$$o_n^3 = \frac{h'^2}{b'^2}\left\{\frac{(n+p)\ b'^2\ h' - n\ b^2\ h}{p}\right\}$$

and

$$o_n^3 = \frac{b'}{h'}\left\{\frac{(n+p)\ b'^2\ h' - n\ b^2\ h}{p}\right\}$$

SUBTERRANEAN RIVER.—Chas. Clark, owner of the Dutchman mine in Central district, recently found some Spanish broom growing on the vergs of the desert which extsnds from Quin River valley to the Humboldt. The broom, which is a shrub that grows about tbree fest higb and is covered during the summer season with yellow flowers, is considered by miners a certain indication of water. As thsre was none of that essential fluid within eight or ten miles of the mine, Clark commenced digging a well right where the shrub grew. He and his assistant eunk about 20 feet below the surface, and one evening about quitting time they dug a hole in the center of the well and broke through a crust into what they believe to be a subterranean river, which filled tbe well almost immediately and compelled them to abandon their tools and go to the surface as speedily as possible. The water is said to be ae pure as that from mountain eprings, and wholly free from alkali. This find ie of great importance, not only to tbe miners of Central district, but to the owners of cattle which range on the plaine and hills in the vicinity.
